In man, insulin hypoglycemia increases by glucose and stimulated by hypoglycemia (or even by a rapid fall in blood glucose without hypoglycemia) and by interference with intracellular glucose utilization, for example, by 2-deoxy-D-glucose. Various stressors (fasting, exercise) likewise inhibit STH secretion after oral glucose administration.

Halász, B.: "Neural control of growth hormone secretion." In: Taylor, S., *Proceedings of the Second International Congress of*

Endocrinology, London, 1964, Part 1, pp. 517-521. Amsterdam, New York and London: Excerpta Medica Foundation, Int. Cong. Series No. 83, 1965. F48,877/65

Glick, S. M., Roth, J., Yalow, R. S., Berzon, S. A.: "The regulation of growth hormone secretion." *Rec. Prog. Horm. Res.* **21**: 241-283 (1965). E5,095/65

Immunobioassays show increased plasma STH values in man following treatment with insulin, fasting, muscular exercise, anesthesia in surgery and other stressor agents. On the other hand, glucose depresses STH secretion.

Friedman, R. C., Reichlin, S.: "Growth hormone content of the pituitary gland of starved rats." *Endocrinology* **76**: 787-788 (1965). F35,443/65

The STH content of the adenohypophysis of rats decreases progressively during starvation for twenty-four to ninety-six hours.

Schalch, D. S.: "The effect of physical stress and exercise in the human on growth hormone and insulin secretion." *Clin. Res.* **13**: 334 (1965). F61,179/65

In man, various stressors (muscular exercise, electroconvulsive therapy, major surgery) increased plasma STH (radioimmunoassay) and FFA levels without affecting plasma insulin. It is possible that STH discharge "may be at least in part responsible for the mobilization of the readily oxidizable FFA which takes place during periods of increased energy requirements."

Ketterer, H., Powell, D., Unger, R. H.: "Growth hormone response to surgical stress." *Clin. Res.* **14**: 65 (1966).

F82,744/66

Radioimmunoassays show that the plasma STH level rises in man within one hour of surgery, reaches a peak within two to four hours, and may continue high for days postoperatively.

Greenwood, F. C., Landon, J.: "Growth hormone secretion in response to stress in man." *Nature* **210**: 540-541 (1966).

F65,986/66

In man, anxiety-causing emotional stress or injection of pyrogen (kind not specified) increased plasma STH levels.

Krulich, L., McCann, S. M.: "Influence of stress on the growth hormone (GH) content of the pituitary of the rat." *Proc. Soc. Exp. Biol. Med.* **122**: 612-616 (1966).

F67,299/66

In rats, pituitary STH activity (epiphyseal cartilage test) was initially decreased and then increased after splenectomy. Formalin injections and ringing of a doorbell raised pituitary STH, cold (3°C) depleted it, and fasting caused a biphasic reaction with an initial depletion followed by a return to normal and secondary depletion after about three days. These and other data suggest that STH secretion in the rat "is very labile and influenced by a variety of stresses as well as by alterations in the supply of available carbohydrate."

Meyer, V., Knobil, E., "Stimulation of growth hormone secretion by vasopressin in the rhesus monkey." *Endocrinology* **79**: 1016-1018 (1966).

F73,022/66

In unanesthetized rhesus monkeys restrained in primate chairs, Pitressin and lysine-vasopressin administered intravenously increased plasma STH levels, but "this action may not be a specific one."

Müller, E. E., Arimura, A., Sawano, S., Saito, T., Schally, A. V.: "Growth hormone-releasing activity in the hypothalamus and plasma of rats subjected to stress." *Proc. Soc. Exp. Biol. Med.* **125**: 874-878 (1967).

F87,123/67

In rats, stress produced by formalin did not induce STH depletion of the pituitary or alter hypothalamic STH-RF activity. On the other hand, exposure to cold did cause these effects.

Copinschi, G., Hartog, M., Earll, J. M., Havel, R. J.: "Effect of various blood

sampling procedures on serum levels of immunoreactive human growth hormone." *Metabolism* **16**: 402-409 (1967).

F83,864/67

Arterial catheterization causes a rise of serum immunoreactive STH in man. For unknown reasons, infusion of NEP and a cold-pressor test elicited no similar change, although the literature shows many examples of an increase in man and animals after exposure to various stressors (28 refs.).

Schalch, D. S.: "The influence of physical stress and exercise on growth hormone and insulin secretion in man." *J. Lab. Clin. Med.* **69**: 256-269 (1967).

G44,274/67

In man, plasma STH often rose during periods of physical stress or exercise, while insulin values remained unchanged or were decreased. EP did not reproduce the release of STH. The failure of plasma insulin levels to rise in response to stress-induced hyperglycemia is consistent with the finding that EP infusion impairs insulin discharge. Plasma glucose and FFA levels rose as expected during physical exercise. Presumably, certain stressors are diabetogenic not only because of EP and corticoid release but also because of a discharge of STH on the one hand, and an EP-induced suppression of insulin secretion on the other.

Frohman, L. A., Horton, E. S., Lebovitz, H. E.: "Growth hormone releasing action of a pseudomonas endotoxin (Piromen)." *Metabolism* **16**: 57-67 (1967).

F75,314/67

In man, intravenous *pseudomonas* endotoxin elevates plasma ACTH and STH levels.

Meyer, V., Knobil, E.: "Growth hormone secretion in the unanesthetized rhesus monkey in response to noxious stimuli." *Endocrinology* **80**: 163-171 (1967).

F75,369/67

In rhesus monkeys with indwelling venous catheters, plasma STH values increased suddenly after various stressors such as pain, hemorrhage, histamine, EP, chlorpromazine, and on occasion, pentobarbital (35 refs.).

Müller, E. E., Saito, T., Arimura, A., Schally, A. V.: "Hypoglycemia, stress and growth hormone release: blockade of growth hormone release by drugs acting on the central nervous system." *Endocrinology* **80**: 109-117 (1967).

F75,362/67

The pituitary STH content (tibia test) was diminished by various stressors (EP, vasopressin, cold, insulin). This effect of insulin hypoglycemia was prevented by dexametha-

sone, and it was assumed that the discharge of pituitary STH "observed after insulin administration may reflect a nonspecific stress effect of the hypoglycemic stimulus."

Müller, E. E.: "Ricerche sul controllo nervoso della secrezione di ormone somatotropo" (On the nervous control of somatotropic hormone secretion). *Rass. Fisiopat. Clin. Ter.* **40**: 175-226 (1968).

H6,967/68

Extensive review of the literature on the mechanism of STH secretion. Numerous observations suggest that during stress the hypothalamus discharges the corresponding releasing factor, and that various stressors increase STH through this pathway which is activated by brain catecholamines.

Schalch, D. S., Reichlin, S.: "Stress and growth hormone release." In: Pecile, A. and Müller, E. E., *Growth Hormone*, pp. 211-225. Amsterdam, New York and London: Excerpta Medica Foundation, Int. Congr. Ser. No. 158, 1968. E8,296/68

Proceedings of a symposium on STH in which this contribution is especially devoted to a survey of that hormone's participation in stress. In both man and squirrel monkeys a variety of stressors cause release of STH. A hypothalamic link is involved, as indicated by the fact that hypoglycemic stress and psychogenic stress responses are blocked by lesions in the ventral hypothalamus. Intrahypothalamic infusions of glucose also blocked the STH response to systemic hypoglycemia. Surprisingly, stress appears to inhibit STH secretion in the rat. In apparent conflict with the literature, the authors were unable to confirm by immunoassay the existence of an STH-RF (42 refs.).

Müller, E. E., Pecile, A.: "Studies on the neural control of growth hormone secretion." In: Pecile, A. and Müller, E. E., *Growth Hormone*, pp. 253-266. Amsterdam, New York and London: Excerpta Medica Foundation, Int. Congr. Ser. No. 158, 1968.

E8,299/68

Observations on rats show that many but not all stressors increase the plasma STH (tibia test) content. Although many similarities in the mechanism of control of ACTH and STH are apparent, a different threshold of stimulation and/or different nervous pathways relaying impulses to the CNS might be the cause of this dissociation. A stimulus releasing STH acts via the hypothalamus,

and catecholamines may be considered as mediators of the STH-RF.

Müller, E. E., dal Pra, P., Pecile, A.: "Influence of brain neurohumors injected into the lateral ventricle of the rat on growth hormone release." *Endocrinology* **83**: 893-896 (1968). H3,581/68

In rats, EP, NEP and dopamine injected into the lateral ventricle induced depletion of pituitary STH, whereas 5-HT, acetylcholine, vasopressin and oxytocin did not share this STH-releasing effect. Presumably, adrenergic mediators participate in the neurohumoral control of STH secretion.

Mason, J. W., Wool, M. S., Wherry, F. E., Pennington, L. L., Brady, J. V., Beer, B.: "Plasma growth hormone response to avoidance sessions in the monkey." *Psychosom. Med.* **30**: 760-773 (1968). H6,463/68

In rhesus monkeys, plasma immunoreactive STH levels usually rise during conditioned avoidance sessions. Venipuncture in itself tends to elevate the "baseline" (45 refs.).

Helge, H., Weber, B., Quabbe, H. J.: "Growth-hormone release and venepuncture." *Lancet* January 25, 1969 p. 204.

H7,240/69

After a brief review of the literature on stress-induced increases in plasma STH, the authors report personal observations showing that venipuncture reduces this effect more commonly in children than in adults or newborns. "These observations suggest that, for children more often than for newborns or adults, a rather harmless medical procedure can represent an iatrogenic stress."

Geisen, K., Meder, R.: "Effekt von Wärme auf das Wachstumshormon beim Menschen" (Effect of heat on growth hormone in man). *Z. Kinderheilkd.* **106**: 308-313 (1969). H17,060/69

In four men taking hot baths the plasma STH and to a lesser extent FFA values rose, whereas plasma cortisol levels remained constant. Literature is cited to show that other stressors (pyrogens, physical exercise, heat) likewise raise the plasma STH level.

Yalow, R. S., Varsano-Aharon, N., Echemendia, E., Berson, S. A.: "HGH and ACTH secretory responses to stress." *Horm. Metab. Dis.* **1**: 3-8 (1969). H12,001/69

In man, electroshock therapy was always

followed by an abrupt rise in plasma ACTH, but without significant alterations in STH release. Histalog, an analogue of histamine, caused an elevation of plasma STH twenty to thirty minutes after the increase in plasma ACTH. "Dissociation of ACTH and growth responses to these stimuli as well as to surgery and vasopressin suggests that the two hormones are not discharged through a common pathway responding in a nondiscriminatory fashion to all noxious stimuli. The secretory response of growth hormone to a variety of stimuli characterized by carbohydrate deficit, established in previous studies, seems to be independent of pathways responding generally to 'stress.'"

Takasawa, T.: "Influence of ether anesthesia and surgical stimulation on the levels of blood human growth hormone and insulin concentrations." *Jap. J. Anesthesiol.* **19**: 271-284 (1970) (Japanese). J24,058/70

In patients under ether anesthesia and during the subsequent surgical interventions, the blood STH concentration rose, whereas the blood insulin content showed no significant change.

Meder, R., Geisen, K.: "Untersuchungen zur wärmeinduzierten STH-Sekretion beim Menschen" (Heat-induced STH secretion in man). *Z. Kinderheilkd.* **108**: 297-304 (1970). H30,451/70

In man the heat-induced elevation of serum STH can be partially suppressed by glucose. Serum glucocorticoids increase only after exposure to more severe stress. Hence, a rise of STH is regarded as the most sensitive stress indicator.

Greene, W. A., Conron, G., Schalch, D. S., Schreiner, B. F.: "Psychologic correlates of growth hormone and adrenal secretory responses of patients undergoing cardiac catheterization." *Psychosom. Med.* **32**: 599-614 (1970). G80,365/70

In patients undergoing cardiac catheterization, "behavioral differences in categories of affect, arousal and degree of interpersonal engagement were used to reliably delineate four major types of psychologic reaction designated anxious-engaged, anxious-not engaged, depressed and calm. There were no elevations of cortisol or growth hormone during the procedure in either the calm or the depressed patients. Anxious-not engaged patients showed major elevations of both cortisol and growth hormone. All the anxious-engaged

patients showed initial high and even increasing levels of cortisol but no increases in growth hormone."

Nagy, I., Kurcz, M., Halmy, L., Mosonyi, L., Baranyai, P., Kiss, C.: "Effect of stress, drugs and hypothalamic extract on anterior pituitary somatotropin content in the rat." *Acta Physiol. Acad. Sci. Hung.* **38**: 357-370 (1970). G87,641/70

Contrary to some earlier claims, insulin, cold, hemorrhage, laparotomy, swimming, suckling, vasopressin, oxytocin and hypothalamic extract all failed to affect the STH content of the adenohypophysis in rats.

Carey, L. C., Cloutier, C. T., Lowery, B. D.: "Growth hormone and adrenal cortical response to shock and trauma in the human." *Ann. Surg.* **174**: 451-460 (1971).

G86,425/71

In U.S. Marines injured during battle, plasma STH levels rose markedly and constantly, whereas cortisol concentrations remained normal or were only slightly elevated. Possibly, STH provides an additional energy source in the form of FFA. The literature on STH secretion during various other types of stress is briefly reviewed. In the discussion following this paper, it is mentioned that, apparently, cortisol excretion is minimal in stress associated with severe shock. However, some investigators found very high cortisol levels following fatal traumatic injury (26 refs.).

Werder, K. von, Schwarz, K.: "Regulation der Sekretion von Wachstumshormon beim Menschen" (The regulation of growth hormone secretion in man). *Dtsch. Med. Wochenschr.* **96**: 2012-2018 (1971).

H44,002/71

Review of the literature on factors regulating STH secretion in man. Among the stressors shown to be effective are surgical interventions, physical and mental trauma, endotoxins and many other long-lasting agents. Acute stress caused by electroshock has proven comparatively inactive. Contrary to the results of some investigations, ACTH does not appear to be a stimulator of STH production, since the suppression of ACTH secretion by dexamethasone does not interfere with the release of STH during insulin hypoglycemia. Even the STH secretion elicited by metyrapone is attributed to a direct effect of the drug upon the hypothalamus rather than to increased ACTH secretion. The rise in blood STH produced by ACTH

or vasopressin is considered to be nonspecific (71 refs.).

Favino, A., Scoz, R., Trecate, G.: "Effetti della stimolazione acustica sulla secrezione di ormone somatotropo umano" (Effect of acoustic stimulation on growth hormone secretion in man). *Boll. Soc. Ital. Biol. Sper.* **47**: 704-708 (1971). H89,995/71

In man the intense noise of an industrial plant raised plasma STH levels. [No technical details are given (H.S.).]

Stubbe, P., Wolf, H.: "The effect of stress on growth hormone, glucose and glycerol levels in newborn infants." *Horm. Metab. Res.* **3**: 175-179 (1971). H42,368/71

In full-term newborn infants the stress of heel pricks caused a decrease in blood STH, whereas glucose and glycerol concentrations were increased, presumably as a consequence of catecholamine release. "The failure of the newborn infant to increase growth hormone concentration, as do individuals during later life, is evidence that adaptation of metabolic and hormonal reactions occurs during the postnatal period."

Brown, G. M., Schalch, D. S., Reichlin, S.: "Patterns of growth hormone and cortisol responses to psychological stress in the squirrel monkey." *Endocrinology* **88**: 956-963 (1971). H37,353/71

In squirrel monkeys, various stressors (capture, chair restraint, intense sound, aversive conditioning) increase plasma STH and cortisol levels, but the two responses are not parallel and presumably are regulated by diverse mechanisms. In the case of chair restraint, STH values fall to resting levels while cortisol continues to rise.

Müller, E. E., Miedico, D., Giustina, G., Cocchi, D.: "Ineffectiveness of hypoglycemia, cold exposure and fasting in stimulating GH secretion in the mouse." *Endocrinology* **88**: 345-350 (1971). H35,410/71

In mice, radioimmunoassayable STH did not decrease under the influence of insulin hypoglycemia or cold exposure, whereas fasting caused a slight depletion of pituitary and an increase of plasma STH levels. "A possible explanation of our results is that the mouse is a species in which, due to the very elevated metabolic rate, the growth hormone secretion, already maximal in basal conditions, cannot be further increased by any of the stimuli which are highly active in other animal species."

Werder, K. von, Hane, S., Forsham, P.: "Hemmung der Stress-bedingten Cortisol- und STH-Sekretion durch endogenen und exogenen Hyperkortizismus" (Inhibition of stress-induced cortisol and STH secretion through endogenous and exogenous hypercorticoidism). *Verh. Dtsch. Inn. Med.* **77**: 1040-1043 (1971). H92,639/71

In man, the rise in plasma STH following the stress of surgical operations or insulin hypoglycemia is inhibited by dexamethasone. Apparently, glucocorticoids exert a negative feedback effect upon STH secretion, although this is not as marked as their influence upon ACTH release.

Newsome, H. H., Rose, J. C.: "The response of human adrenocorticotrophic hormone and growth hormone to surgical stress." *J. Clin. Endocrinol. Metab.* **33**: 481-487 (1971). H45,875/71

Observations on patients who have undergone various forms of surgery suggest that STH and ACTH plasma levels rise in a parallel fashion and are presumably mediated through a common afferent pathway in the spinal cord.

Devlin, J. G., Varma, M. P. S., Kuti, J., O'Boyle, A.: "Studies on growth hormone release and cortisol with intravenous glucose loading." *Ir. J. Med. Sci.* **141**: 69-78 (1972). J19,599/72

Data on patients under extreme stress following myocardial infarction or major surgical interventions. 1. Growth hormone release is not readily suppressible by glucose in the stress situation studied. 2. Circulating catecholamines are probably not primarily involved in releasing excess growth hormone, as insulin release is more frequently elevated at the same time. 3. The paradoxical rise in glucose which can occur in extreme stress, appears to be a reversion to a primitive pattern of growth hormone secretion which is observed in the newborn infant. 4. The effect of glucose in adequately suppressing A.C.T.H. while producing statistically insignificant suppression of growth hormone releases, suggests either that the A.C.T.H. secreting cell is more sensitive to the direct effect of glucose, or that extra-pituitary factors, either neuronal or hormonal, may be of more significance in controlling growth hormone release."

Hanssen, K. F., Asfeldt, V. H.: "Human growth hormone secretion during major surgical stress and the influence of pre-treatment

with dexamethasone." *Horm. Metab. Res.* **4**: 57 (1972). H51,815/72

The plasma STH rise which occurs during the first hour after surgical operations in man is not inhibited by dexamethasone, although ACTH secretion is suppressed.

Mitra, R., Johnson, H. D.: "Growth hormone response to acute thermal exposure in cattle." *Proc. Soc. Exp. Biol. Med.* **139**: 1086-1089 (1972). H54,712/72

In cattle, exposure to heat causes a rise in blood STH.

Okada, Y., Matsuoka, T., Kumahara, Y.: "Human growth hormone secretion during exposure to hot air in normal adult male subjects." *J. Clin. Endocrinol. Metab.* **34**: 759-763 (1972). H54,871/72

In four normal obese adult males exposed to hot air (48°C) for one hour after an overnight fast, elevation of body temperature was associated with increased plasma STH and FFA levels. No significant changes in cortisol, total thyroxine-iodine, blood glucose or hematocrit were noted during heat exposure. In two subjects, administration of glucose before heat exposure prevented the rise in plasma STH.

Hartley, L. H., Mason, J. W., Hogan, R. P., Jones, L. G., Kotchen, T. A., Mougey, E. H., Wherry, F. E., Pennington, L. L., Ricketts, P. T.: "Multiple hormonal responses to graded exercise in relation to physical training." *J. Appl. Physiol.* **33**: 602-606 (1972). H79,757/72

In man the stress of heavy bicycle exercise increased plasma STH, cortisol and EP values, but decreased insulin concentration.

Fekete, M., Milner, R. D. G., Soltész, G., Assan, R., Mestyán, J.: "Plasma glucagon, thyrotropin, growth hormone and insulin response to cold exposure in the human newborn." *Acta Paediatr. Scand.* **61**: 435-441 (1972). G92,222/72

In full-term and premature babies, exposure to cold caused no significant change in plasma insulin, glucagon, STH or TTH concentrations.

Kokka, N., Garcia, J. F., George, R., Elliott, H. W.: "Growth hormone and ACTH secretion: evidence for an inverse relationship in rats." *Endocrinology* **90**: 735-743 (1972). H52,549/72

In rats, noise, vibration, ether, cold, insulin, pentylenetetrazol, amphetamine and 2-D-deoxyglucose caused a rise in plasma corti-

costerone with a corresponding fall in STH. Gentling or administration of pentobarbital lowered corticosterone and increased STH in plasma. The results are interpreted as indicating an inverse relationship between ACTH and STH secretion that is in accordance with the "pituitary-shift" theory.

Lundbaek, K., Johansen, K., Ørskov, H., Speich, E.: "Anxiety, growth hormone and glucose tolerance in normal children." *Acta Med. Scand.* **192**: 539-542 (1972). G98,671/72

Emotional stress decreases glucose tolerance in children, perhaps partly because it stimulates STH secretion.

Brown, G. M., Reichlin, S.: "Psychologic and neural regulation of growth hormone secretion." *Psychosom. Med.* **34**: 45-61 (1972). G88,877/72

A number of stressors (trauma, electroshock therapy, pyrogens, hypoglycemia, posterior pituitary extract, and even emotional arousal) have been shown to increase plasma STH levels in man and monkeys. Yet there is also a considerable rise in plasma STH levels during sleep in man. The literature on the pituitary and plasma STH concentrations of rats exposed to various stressors is somewhat contradictory and difficult to interpret. However, in most species, stress causes an STH discharge which parallels glucocorticoid secretion, and which may be interpreted as a manifestation of stress comparable to the discharge of ACTH. Since the response can be blocked by hypothalamic or infundibular lesions, it is presumably mediated through the CNS. However, the mechanisms for STH and corticoid discharge are independent, since a dissociation between the two is frequently found in man and monkeys after exposure to various stimuli (196 refs.).

Frantz, A. G., Kleinberg, D. L., Noel, G. L.: "Studies on prolactin in man." *Rec. Prog. Horm. Res.* **28**: 527-590 (1972). E10,243/72

In man the plasma content of STH and LTH rises after various forms of stress, particularly muscular exercise and major surgical interventions. However, there is no strict parallelism between the blood concentrations of the two hormones following psychogenic stress. For example, in nursing women, plasma LTH rises, usually without any associated increase in STH concentration.

Reier, C. E., George, J. M., Kilman, J. W.: "Cortisol and growth hormone re-

sponse to surgical stress during morphine anesthesia." *Anesth. Analg. (Cleve.)* **52**: 1003-1010 (1973). J8,185/73

After surgery, the usual increase in plasma cortisol and STH was blocked by large doses of morphine used in connection with anesthesia. Adrenocortical responsiveness was not affected, as indicated by the continued efficacy of exogenous ACTH in raising plasma cortisol. The blockade of these hormone secretions during stress did not seem to influence the clinical condition. "Nonetheless, since it is thought that the adrenocortical response is essential for stress survival, the recommendation that morphine in doses larger than 2 mg./kg. be avoided, appears prudent."

McKeown, B. A., John, T. M., George, J. C.: "Circadian rhythm of plasma growth hormone levels in the pigeon." *J. Interdiscipl. Cycle Res.* **4**: 221-227 (1973).

J9,766/73

Radioimmunoassays revealed that in pigeons there is a definite circadian cycle of plasma STH, reaching a peak at 06:00 and a low point at 18:00. This rhythm is correlated with corresponding changes in FFA levels.

Turner, R. C., Oakley, N. W., Beard, R. W.: "Human fetal plasma growth hormone prior to the onset of labour." *Biol. Neonate* **22**: 169-176 (1973). J6,903/73

The STH content of human fetal plasma rises during induction of labor, presumably owing to the stressor effect of delivery. This response may prevent neonatal hypoglycemia.

Collu, R., Jéquier, J. C., Letarte, J., Leboeuf, F., Ducharme, J. R.: "Effect of stress and hypothalamic deafferentation on the secretion of growth hormone in the rat." *Neuroendocrinology* **11**: 183-190 (1973).

H68,127/73

In rats, ether and auditory stressors were equally effective in diminishing plasma STH (radioimmunoassay) in controls and frontally deafferented animals. Ether stress also inhibited STH secretion in completely deafferented animals, whereas auditory stress was ineffective. α -MT pretreatment blocked the effect of ether stress after deafferentation. These and other data "seem to indicate that ether stress is transmitted through a humoral, dopaminergic pathway, while auditory stress follows a nervous pathway." [The many observations indicating increased STH

secretion during stress are not discussed (H.S.).]

Parkhie, M. R., Johnson, H. D.: "Hypothalamic growth hormone releasing factor: release and synthesis after exposure to a high ambient temperature." *Proc. Soc. Exp. Biol. Med.* **142**: 311-315 (1973). H64,888/73

Studies on the release and synthesis of hypothalamic STH-RF in rats exposed to heat. In general, resynthesis keeps pace with the RF discharge (27 refs.).

Massara, F., Camanni, F., Molinatti, G. M.: "Liberazione di ormone somatotropo in seguito a stimolazione alfa-adrenergica nell'uomo" (Somatotropic hormone secretion following α -adrenergic stimulation in man). *Folia Endocrinol. (Roma)* **26**: 476-482 (1973). H83,466/73

Observations in man suggest that stimulation of α -adrenergic receptors excites CNS centers to cause STH secretion.

Shire, J. G. M.: "Growth hormone and premature ageing." *Nature* **245**: 215-216 (1973). H78,587/73

In certain strains of dwarf mice, premature aging is associated with decreased STH production and depressed ^3H -thymidine uptake by several tissues including the thymus. These dwarf mice are also deficient in other hormones, and not all strains show premature aging. Hence, "the altered uptake of thymidine in dwarf mice close to death could be caused by stress rather than by premature ageing."

McCann, S. M., Ajika, K., Fawcett, C. P., Hefco, E., Illner, P., Negro-Vilar, A., Orias, R., Watson, J. T., Krulich, L.: "Hypothalamic control of the adenohypophyseal response to stress by releasing and inhibiting neurohormones." In: Németh, Š., *Hormones, Metabolism and Stress. Recent Progress and Perspectives*, pp. 67-77. Bratislava: Slovak Academy of Sciences, 1973. E10,458/73

Report based mainly on plasma hormone determinations and observations on rats whose hypothalamus-pituitary system was isolated with the Halász knife. The authors were led to the conclusion that "following the application of a stressful stimulus, afferent impulses are probably generated which pass to the brainstem and thence to the hypothalamus where they influence release of the various releasing and inhibiting hormones which control the AP. We would postulate that the afferent pathways are similar for all

AP hormones and that the differential patterns of release are brought about by specific intrahypothalamic mechanisms. Consistent with this hypothesis is the differential localization of the various releasing and inhibiting factors in the hypothalamus." Mere transfer from the stockroom to the laboratory sufficed to cause a dramatic increase in the serum STH and LH values within less than one hour.

Müller, E. E.: "Nervous control of growth hormone secretion." *Neuroendocrinology* 11: 338-369 (1973). H71,999/73

Review on the neural control of STH secretion in mammals. Electrolytic lesions in discrete hypothalamic areas reduced pituitary and plasma radioimmunoassayable STH and impaired somatic growth. Such lesions caused diminished STH discharge in response to insulin but not after electric stimulation of brain areas. Hypothalamic STH secretion seems to be governed by an STH-releasing neurohormone which has been purified, isolated and synthesized, and represents a straight-chain acidic decapeptide. There is also proof of an inhibitory hypothalamic factor whose function in STH secretion is not yet clear. The STH-RF decreases in the hypothalamus and increases in the plasma when STH release is enhanced. Catecholamines play a significant role in the neurohormonal control of STH secretion. Serum STH is greatly increased in man following ingestion of L-dopa (a precursor of dopamine), whereas chlorpromazine, an antiadrenergic drug, depresses the STH level. During deep sleep, human STH secretion apparently is independent of alterations in brain catecholamine turnover, but like other anterior pituitary hormones, STH is subject to a feedback on itself which decreases its own secretion (about 150 refs.).

Kato, Y., Dupré, J., Beck, J. C.: "Plasma growth hormone in the anesthetized rat: effects of dibutyryl cyclic AMP, prostaglandin E₁, adrenergic agents, vasopressin, chlorpromazine, amphetamine and L-dopa." *Endocrinology* 93: 135-146 (1973). H72,167/73

Dibutyryl cAMP and a very large number of drugs influencing CNS activity increased plasma STH in the rat. In several instances, this was inhibited by adrenergic blocking agents. Yet the authors maintain that "stressful agents" such as histamine, formalin, laparotomy and insulin failed to

cause a significant increase in plasma STH. [This is difficult to reconcile with the authors' assumption that STH discharge in the rat depends upon adrenergic stimuli, unless the stressors used were not sufficiently severe to induce a catecholamine discharge (H.S.).]

Cleghorn, J. M.: "Endocrine spotlights on brain and behaviour." *Can. Psychiatr. Assoc. J.* 18: 449-451 (1973). J21,579/73

Review of the literature on STH release during stress.

H81,378/74

In rats, stress produced by ether or immobilization caused a marked reduction of STH and abolished its circadian rhythm in plasma.

Singh, A. K., Chansouria, J. P. N., Singh, R. K., Wahi, R. S., Udupa, K. N.: "Hormonal and metabolic alterations following surgical trauma." *5th Asia and Oceania Congr. Endocr.*, pp. 50-51. Chandigarh, India, 1974. H82,068/74

In patients the stress of major surgery caused an increase in plasma STH, cortisol and FFA, with a decrease in plasma insulin.

Natelson, B. H., Smith, G. P., Stokes, P. E., Root, A. W.: "Plasma 17-hydroxycorticosteroids and growth hormone during defense reactions." *Am. J. Physiol.* **226**: 560-568 (1974). H83,654/74

In rhesus monkeys, electric stimulation of the hypothalamus caused a rise in plasma 17-OHCS, especially during the initial excitement. Although increases were obtained after stimulation of various sites scattered throughout the anterior, tuberal and posterior parts of the lateral hypothalamus, plasma STH rose only when posterior sites were stimulated. This pattern of a smaller hypothalamic area for STH than for ACTH release has also been observed in the rat, cat and squirrel monkey and it is probably a general principle of organization.

Lin, T., Tucci, J. R.: "Provocative tests of growth-hormone release. A comparison of results with seven stimuli." *Ann. Intern. Med.* **80**: 464-469 (1974). J12,327/74

In man, insulin, glucagon, L-dopa, and less regularly, ACTH or physical exercise increase plasma STH levels. Metyrapone has no such effect.

Brown, W. A., Krieger, D. T., Woert, M. H. van, Ambani, L. M.: "Dissociation of growth hormone and cortisol release following apomorphine." *J. Clin. Endocrinol. Metab.* **38**: 1127-1130 (1974). H87,291/74

In man, apomorphine-induced STH release is probably not mediated through systemic stress but through a specific effect on dopamine receptor sites in the ME, since it is not associated with cortisol release.

Smythe, G. A., Lazarus, L.: "Suppression of human growth hormone secretion by melatonin and cyproheptadine." *J. Clin. Invest.* **54**: 116-121 (1974). H87,405/74

In the rat as in man, STH secretion, stimulated by serotonergic pathways, can be inhibited by treatment with 5-HT antagonists such as cyproheptadine and the pineal gland hormone, melatonin. [In this respect, these

compounds resemble the actions of somatostatin (H.S.).]

Ogawa, N.: "Growth hormone releasing factor activity in the stalk-median eminence and plasma growth hormone response to the ether-laparotomy stress in the rat." *Endocrinol. Jap.* **21**: 33-38 (1974). H86,183/74

In rats exposed to the stressor effect of laparotomy under ether anesthesia, a diminution of STH secretion was attributed to suppression of STH-RF discharge or to increased excretion of an inhibitory factor.

George, J. M., Reier, C. E., Lanese, R. R., Rower, J. M.: "Morphine anesthesia blocks cortisol and growth hormone response to surgical stress in humans." *J. Clin. Endocrinol. Metab.* **38**: 736-741 (1974). H86,212/74

In children with defective growth due to STH deficiency, "EEG-monitored slow-wave sleep provided discriminatory serum growth hormone responses equivalent to those obtained by arginine and insulin-hypoglycaemia provocation. Exercise was less effective but was able to provide a useful screening test."

Frankel, R. J., Jenkins, J. S.: "Hypothalamic-pituitary function in anorexia nervosa." *Acta Endocrinol. (Kbh.)* **78**: 209-221 (1975). H96,571/75

Description of hormonal derangements in anorexia nervosa. The sulfation factor is deficient, and through a negative feedback, it could be responsible for the enhanced STH secretion.

Newsome, H. H. Jr.: "Growth hormone in surgical stress." *Surgery* **77**: 475-477 (1975). J23,317/75

During surgical trauma, STH secretion is increased in man.

Wright, P. D., Johnston, I. D. A.: "The effect of surgical operation on growth hormone levels in plasma." *Surgery* **77**: 479-486 (1975). J23,318/75

The authors assume that increased STH secretion is a response to glucose intolerance caused by operative interventions in man.

Rose, R. M., Hurst, M. W.: "Plasma cortisol and growth hormone responses to intravenous catheterization." *J. Hum. Stress* **1**: 22-36 (1975). H97,894/75

In patients, the first catheterization tended to produce parallel rises in plasma STH and cortisol, but the STH responses were much more variable. In general, the findings "suggest a definite endocrine adaptation to catheterization by the second or third hour of the experience."

Collu, R., Jéquier, J. C., Chabot, C., Letarte, J., Leboeuf, G., Ducharme, J. R.: "Pituitary response to auditory stress: effect of treatment with α -methyl-p-tyrosine (α -MT)." *Endocrinology* (In press). J18,335/

In rats, auditory stress increases plasma corticosterone through catecholaminergic, and decreases plasma STH through noncatecholaminergic, pathways, as judged by the effect of pretreatment with α -MT.

FSH (Follicle-stimulating Hormone) and LH (Luteinizing Hormone)

Indirect evidence suggests that in various animal species acute stress can cause ovulation, whereas chronic stress tends to inhibit the estrous or menstrual cycle, presumably through some effect on FSH and LH production or activity. However, there are comparatively few data in the literature concerning direct determinations of these gonadotropins in the blood during stress.

In ovariectomized rats, acute stress (ether, hemorrhage) produced an elevation of plasma FSH, LH and LTH within two minutes.

On the basis of cytochemical changes in the pituitary, it was assumed that stressors increase gonadotropin (LH, FSH) production simultaneously with an enhanced ACTH discharge. This would be contrary to the concept of a "shift in anterior pituitary hormone secretion" during stress.

In rats, the stress of laparotomy under ether allegedly elevates LTH but not LH titers; these discrepancies may depend upon the period in the estrous cycle when the stressor is applied. Apparently, even mere transfer of a rat from the stockroom to the laboratory suffices to cause a pronounced increase in serum LH and STH.

FSH and LH

(See also our earlier stress monographs, p. xiii)

Arvay, A., Balázs, L.: "Changes in the gonadotropic function of the adenohypophysis in response to nervous stress." *Acta Physiol. Acad. Sci. Hung.* **14**: 317-325 (1958). C69,256/58

On the basis of cytochemical changes in the rat pituitary, it is assumed that stressors increase gonadotropin production simultaneously with enhanced ACTH secretion. This would be incompatible with the theory of a "shift in anterior pituitary hormone secretion" during stress.

McCann, S. M., Ajika, K., Fawcett, C. P., Hefco, E., Illner, P., Negro-Vilar, A., Orias, R., Watson, J. T., Krulich, L.: "Hypothalamic control of the adenohypophyseal response to stress by releasing and inhibiting neurohormones." In: Németh, Š., *Hormones, Metabolism and Stress. Recent Progress and Perspectives*, pp. 67-77. Bratislava: Slovak Academy of Sciences, 1973. E10,458/73

Report based mainly on plasma hormone determinations and observations on rats whose hypothalamus-pituitary system was isolated with the Halász knife. The authors were led to the conclusion that "following the application of a stressful stimulus, afferent impulses are probably generated which pass to the brainstem and thence to the hypothalamus where they influence release of the various releasing and inhibiting hormones which control the AP. We would postulate that the afferent pathways are similar for all AP hormones and that the differential patterns of release are brought about by specific intrahypothalamic mechanisms. Consistent with this hypothesis is the differential localization of the various releasing and inhibiting factors in the hypothalamus." Mere transfer from the stockroom to the laboratory sufficed to cause a dramatic in-

crease in the serum STH and LH values within less than one hour.

Carstensen, H., Amér, I., Wide, L., Amér, B.: "Plasma testosterone, LH and FSH during the first 24 hours after surgical operations." *J. Steroid Biochem.* **4**: 605-611 (1973). J10,319/73

In patients, plasma LH and testosterone concentrations decreased four to five hours after surgery. LH subsequently returned to normal, whereas testosterone remained low over the twenty-four hour observation period. No change in plasma FSH was noted.

Daly, J. R., Evans, J. I.: "Daily rhythms of steroid and associated pituitary hormones in man and their relationship to sleep." *Adv. Steroid Biochem. Pharmacol.* **4**: 61-110 (1974). J15,152/74

Detailed review on the function of the hypothalamo-pituitary-adrenal axis in man during sleep, with a description of the methodology for EEG measurement of sleep and a periodic obtention of blood specimens by means of an intravenous catheter throughout the night. The plasma corticoids drop gradually from a zenith at 08:00 to a nadir at midnight. The circadian rhythm of plasma testosterone has been less carefully studied but appears to run parallel to that of cortisol; however, unlike the latter, it cannot be inhibited by dexamethasone. The circadian variations of FSH and LH likewise receive comparatively little attention, but sleep-related rises in LH secretion are regularly observed during adolescence. There are two phases of cortisol elimination, "basal" and "impulsive;" only the latter shows an early morning peak sensitive to corticoid inhibition (about 220 refs.).

Valenti, G., Tarditi, E., Ceda, G. P., Banchini, A.: "Sui meccanismi di regolazione omeostatica del sistema gonadotropo-secerente. Considerazioni sul ritmo circadiano della gonadotropina LH" (On the mechanism of homeostatic regulation of the gonadotrophin-secreting system. Considerations on the circadian rhythm of LH). *Minerva Med.* **65**: 2526-2540 (1974). J17,020/74

Kawakami, M., Terasawa, E., Arita, J.: "Effects of hippocampal ablation on stress-induced gonadotropin secretion: an observation of the sexual difference." *Endocrinol. Jap.* **21**: 289-296 (1974). H96,221/74

Various stressors increased FSH in females and in orchidectomized, folliculoid-pretreated males, but this effect was suppressed by hippocampal ablation. Serum LH was not altered by stressors in either sex. "Hippocampal ablation, however, brought about LH release in stressed females and abolished stress-induced increase in LH in orchidectomized estrogen primed males."

Howland, B. E., Beaton, D. B., Jack, M. I.: "Changes in serum levels of gonadotropins and testosterone in the male rat in response to fasting, surgery and ether." *Experientia* **30**: 1223-1225 (1974). H98,258/74

Euker, J. S., Meites, J., Riegle, G. D.: "Effects of acute stress on serum LH and prolactin in intact, castrate and dexamethasone-treated male rats." *Endocrinology* **96**: 85-92 (1975). H98,033/75

In rats, ACTH, LTH and LH concentrations in the blood may be increased by some stressors. Hence a shift in anterior pituitary production is by no means the rule.

LTH (The Luteotropic or Lactotropic Hormone, Prolactin)

In rats with well-developed mammary glands, after estradiol pretreatment, various stressors (cold, restraint, formaldehyde) initiated lactation. This was ascribed to the enhancement of LTH secretion, although the plasma levels of the hormone were not actually determined. It has been postulated that stressors (laparotomy, hemorrhage), like suckling, can induce LTH release from the pituitary by suppressing the production of LTH-inhibiting hypothalamic material. Stressors also reduce the LTH content of the pituitary in the rat, whereas bovine ME extracts inhibit the stress-induced fall in pituitary LTH, even after the combined stimuli of nursing plus stress. This has been interpreted as additional evidence of an LTH-inhibitory hypothalamic factor.

Stressors (laparotomy, ether) elevated serum LTH but not LH titers in the rat, a

peak being reached within a few minutes in both sexes. On the other hand, handling for four days lowered serum LTH in females but raised it in males.

Most authors agree that, in man, various stressors (for example, surgery under ether anesthesia, exercise, insulin, sexual intercourse) increase both the LTH and the STH content of the plasma. However, there is no strict parallelism between the blood concentration of the two hormones, either following psychogenic stress or in lactating women whereas LTH secretion is raised in the absence of any associated increase in STH production.

Both nicotine and ether increase plasma LTH and TTH in the rat, but suckling raises LTH without any change in TTH levels.

A series of stressors (mostly traumatic) suppressed the diurnal, but not the nocturnal, peaks of LTH secretion in the rat. Retrochiasmatic sections abolished both surges. Septal lesions failed to affect either the baseline or the stress level of LTH in the rat although the plasma corticosterone concentrations were elevated following exposure to stressors. Presumably, the production of corticosterone and LTH is under different neural control mechanisms.

Comparative studies on other species, such as hamsters, newts and cattle, also revealed LTH discharges during stress, but on the whole the literature on all species is rather contradictory. Apparently, the release of LTH following exposure to stressors depends on the intensity and duration of the stimulus, the stage of the cycle, the availability of LTH in the pituitary, and numerous other factors.

LTH

(See also our earlier stress monographs, p. xiii)

Swingle, W. W., Seay, P., Perlmutt, J., Collins, E. J., Barlow, G. Jr., Fedor, E. J.: "An experimental study of pseudopregnancy in rat." *Am. J. Physiol.* **167**: 586-592 (1951). B65,305/51

In rats a variety of stressors can produce pseudopregnancy owing to LTH release.

Nicoll, C. S., Talwalker, P. K., Meites, J.: "Initiation of lactation in rats by nonspecific stresses." *Am. J. Physiol.* **198**: 1103-1106 (1960). C87,153/60

In estradiol-pretreated rats, various stressors (cold, restraint, formaldehyde) initiated lactation. "It is concluded that nonspecific stresses can promote the secretion of prolactin and ACTH from the anterior pituitary in amounts adequate to induce lactation in estrogen-primed rats."

Gavazzi, G., Giuliani, G., Martini, L., Pecile, A.: "Action de plusieurs stress sur la libération de prolactine (hormone lutéotrophique-L.T.H.)" (Action of repeated stress on the liberation of prolactin [luteotropic hormone-L.T.H.]). *Ann. Endocrinol. (Paris)* **22**: 788-791 (1961). D17,166/61

Grosvenor, C. E.: "Effect of nursing and stress upon prolactin-inhibiting activity of the rat hypothalamus." *Endocrinology* **77**: 1037-1042 (1965). F58,062/65

Stressors (laparotomy, bleeding), like suckling, cause LTH release from the pituitary. On the basis of experiments with hypothalamic extracts, it is suggested that "the acute stimuli of nursing and stress effect the release of prolactin in the rat by suppressing the release of a prolactin-inhibiting substance from the hypothalamus."

Grosvenor, C. E., McCann, S. M., Nallar, R.: "Inhibition of nursing-induced and stress-induced fall in pituitary prolactin concentration in lactating rats by injection of acid extracts of bovine hypothalamus." *Endocrinology* **76**: 883-889 (1965). F39,155/65

In rats, exposure to various stressors, as well as nursing, reduces the LTH content of the pituitary. Nembutal prevents the fall of LTH after laparotomy and bleeding. Acid extracts of bovine stalk-ME inhibit the stress-induced fall in pituitary LTH concentration following the combined stimuli of nursing and stress. There may exist "a hypothalamic inhibitory factor in the normal regulation of prolactin release in response to nursing or stress."

Neill, J. D.: "Effect of 'stress' on serum prolactin and luteinizing hormone levels during the estrous cycle of the rat." *Endocrinology* **87**: 1192-1197 (1970).

H34,070/70

In rats the stress of laparotomy under ether elevated serum LTH but not LH titers. The LTH release varied according to stages of the estrous cycle.

Bryant, G. D., Linzell, J. L., Greenwood, F. C.: "Plasma prolactin in goats measured by radioimmunoassay: the effects of teat stimulation, mating behavior, stress, fasting and of oxytocin, insulin and glucose injections." *Hormones* **1**: 26-35 (1970).

G76,754/70

In goats, plasma LTH measured by radioimmunoassay showed considerable rises following copulation (in both males and females), oxytocin injections and the mild stress of restraint, as well as during lactation. Conversely, fasting and insulin caused a fall in serum LTH (19 refs.).

Nagy, I., Kurcz, M., Kiss, C., Baranyai, P., Mosonyi, I., Halmy, L.: "The effect of suckling, stress and drugs on pituitary prolactin content in the rat." *Acta Physiol. Acad. Sci. Hung.* **38**: 371-380 (1970).

H39,458/70

Radioimmunologic determinations in cows and goats led to the conclusion that various stressors (venipuncture, pain, restraint, emotional disturbances) elevate the plasma LTH level, but milking is most effective in this respect.

Raud, H. R., Kiddy, C. A., Odell, W. D.: "The effect of stress upon the determination of serum prolactin by radioimmunoassay." *Proc. Soc. Exp. Biol. Med.* **136**: 689-693 (1971).

H37,004/71

In cattle, various stressors, including removal of blood samples for determinations, raise the radioimmunologically demonstrable LTH level of the serum.

Wakabayashi, I., Arimura, A., Schally, A. V.: "Effect of pentobarbital and ether stress on serum prolactin levels in rats." *Proc. Soc. Exp. Biol. Med.* **137**: 1189-1193 (1971).

H46,646/71

In rats the stress of ether anesthesia in-

creased serum LTH levels to a peak within 2.5 minutes of interrupting administration of the anesthetic. This response was the same in both sexes, but handling for four days lowered serum LTH in female rats, whereas the same procedure raised it in males. Pentobarbital markedly increased serum LTH in females, but only slightly in males. Apparently, various stressors affect serum LTH, but the extent and even the direction of the changes are largely sex-dependent.

Terkel, J., Blake, C. A., Sawyer, C. H.: "Serum prolactin levels in lactating rats after suckling or exposure to ether." *Endocrinology* **91**: 49-53 (1972). H56,107/72

Observations on rats "suggest that suckling and ether 'stress' trigger the release of LTH by different mechanisms."

Dunn, J. D., Arimura, A., Scheving, L. E.: "Effect of stress on circadian periodicity in serum LH and prolactin concentration." *Endocrinology* **90**: 29-33 (1972).

H50,464/72

Noel, G. L., Suh, H. K., Stone, J. G., Frantz, A. G.: "Human prolactin and growth hormone release during surgery and other conditions of stress." *J. Clin. Endocrinol. Metab.* **35**: 840-851 (1972).

H62,342/72

On the basis of observations during major surgery under anesthesia, exercise, insulin injections and sexual intercourse, it was concluded that "prolactin in human beings is at least as responsive as growth hormone to release by stress in most situations."

Frantz, A. G., Kleinberg, D. L., Noel, G. L.: "Studies on prolactin in man." *Rec. Prog. Horm. Res.* **28**: 527-590 (1972).

E10,243/72

In man the plasma content of STH and LTH rises after various forms of stress, particularly muscular exercise and major surgical interventions. However, there is no strict parallelism between the blood concentrations of the two hormones following psychogenic stress. For example, in nursing women the plasma LTH level rises usually without any associated increase in STH concentration.

Gala, R. R., Loginsky, S. J.: "Correlation between serum prolactin levels and incidence of mammary tumors induced by 7,12-dimethylbenz[α]anthracene in the rat." *J. Natl. Cancer Inst.* **51**: 593-597 (1973).

J5,797/73

Rats that secrete large amounts of LTH after ether stress fail to develop mammary tumors under the influence of 7,12-dimethylbenz[α]anthracene.

L'Hermite, M.: "The present status of prolactin assays in clinical practice." *Clin. Endocrinol. Metab.* **2**: 423-449 (1973).

J8,615/73

Review on the conditions associated with increased LTH secretion, some of which are manifestly active stressors, while others are more specifically related to milk production. They are summarized in the table below.

Blake, C. A.: "Stimulation of pituitary prolactin and TSH release in lactating and proestrous rats." *Endocrinology* **94**: 503-508 (1974).

H86,287/74

In rats, both nicotine and ether increased plasma LTH but not TTH. This was ascribed to stress. Suckling raised the LTH without influencing the TTH level of the plasma.

Freeman, M. E., Smith, M. S., Nazian, S. J., Neill, J. D.: "Ovarian and hypothalamic control of the daily surges of prolactin secretion during pseudopregnancy in the rat." *Endocrinology* **94**: 875-882 (1974).

H85,365/74

In rats, stimulation of the uterine cervix induces a pattern of two daily surges of LTH secretion, one diurnal, the other nocturnal. A series of stressors (aortic cannulation, blood sampling, surgical interventions) selectively and temporarily suppressed the diurnal but not the nocturnal surges. Hypothalamic retrochiasmatic cuts immediately abolished both surges.

Relkin, R.: "Effects of alterations in serum osmolality on pituitary and plasma prolactin levels in the rat." *Neuroendocrinology* **14**: 61-64 (1974). H83,086/74

In rats, infusion of large volumes of hypotonic saline decreased, whereas hypertonic saline increased, plasma levels of LTH. This

Conditions characterized by elevated blood prolactin levels

Physiological

- Nocturnal discharge (sleep)
- Luteal phase of menstrual cycle
- Pregnancy
- Postpartum period
- Suckling and breast manipulation
- Neonatal period
- Exercise
- Stressful situations
- Sexual intercourse

Pathological

- Syndromes characterised by amenorrhoea and galactorrhoea (Chiari-Frommel, Ahumada-Del Castillo, Argonz-Del Castillo, Forbes-Albright syndromes; oral contraceptive withdrawal)
- Pituitary tumours secreting prolactin
- Pituitary stalk section with disturbance of hypothalamo-pituitary relationships, e.g. by suprasellar and infrasellar tumours
- Juvenile hypothyroidism (athyreosis)
- Renal failure
- Ectopic production of the hormone by malignant tumors, e.g. undifferentiated bronchial carcinoma and hypernephroma
- Surgical stress

Pharmacological

- Insulin-induced hypoglycaemia
- Administration of synthetic TRH
- High dosages of oestrogens
- Psychotropic drugs, e.g. phenothiazines, butyrophenones, sulpiride, etc.
- Reserpine and α -methyldopa administration
- General anaesthesia

is probably not due to stress, since stimuli equal in stressor potency produced disparate results.

Euker, J. S., Riegle, G. D.: "Stress effects on serum prolactin in the female rat." *Fed. Proc.* **33**: 238 (1974). H83,894/74

In rats the effect of stressors on serum LTH "appears to be complex, relating not only to the stress intensity and to the stage of the cycle, but also to the initial hormonal levels at the time of stress." [The brief abstract does not lend itself to evaluation (H.S.).]

Donofrio, R. J., Reiter, R. J., Sorrentino, S. Jr., Blask, D. E., Talbot, J. A.: "A method for measurement of prolactin in the hamster by means of radioimmunoassay." *Neuroendocrinology* **13**: 79-92 (1974).

H81,379/74

In hamsters the combined stress of ether anesthesia and laparotomy significantly elevated plasma LTH levels but slightly depressed pituitary LTH, suggesting a release of the hormone. These results agreed with earlier observations in the rat.

Uhlir, I., Seggie, J., Brown, G. M.: "The effect of septal lesions on the threshold of adrenal stress response." *Neuroendocrinology* **14**: 351-355 (1974). H89,268/74

In rats with septal lesions, "baseline corticosterone values were unaltered, plasma corticosterone concentrations in lesioned animals were elevated in response to stimuli that did not produce a corresponding elevation in sham-lesioned and unlesioned animals. Neither baseline nor stress levels of prolactin were affected by septal lesions at the times studied. It is concluded that a septal lesion lowers the stimulation threshold for activation of the pituitary adrenal axis and is suggested that corticosterone and prolactin stress responses are under different neural control."

Gona, A. G., Gona, O.: "Prolactin-releasing effects of centrally-acting drugs in the red-spotted newt." *Neuroendocrinology* **14**: 365-368 (1974). H89,271/74

Mueller, G. P., Chen, H. T., Dibbet, J. A., Chen, H. J., Meites, J.: "Effects of warm and cold temperatures on release of TSH, GH, and prolactin in rats." *Proc. Soc. Exp. Biol. Med.* **147**: 698-700 (1974).

H98,469/74

In rats exposed to heat or cold, the fact

that TTH and LTH secretion "responded oppositely to the same temperature changes suggests that different mechanisms regulate release of these two hormones under these conditions. The possible role of stress, and the interactions of the hypothalamic hypophysiotropic hormones and biogenic amines in the temperature-induced changes remain to be evaluated."

Euker, J. S., Meites, J., Riegle, G. D.: "Effects of acute stress on serum LH and prolactin in intact, castrate and dexamethasone-treated male rats." *Endocrinology* **96**: 85-92 (1975). H98,033/75

In rats, ACTH, LTH, and LH concentrations in the blood may be increased by some stressors. Hence, a shift in anterior pituitary production is by no means the rule.

Krulich, L., Hefco, E., Aschenbrenner, J. E.: "Mechanism of the effects of hypothalamic deafferentation on prolactin secretion in the rat." *Endocrinology* **96**: 107-118 (1975). H98,036/75

TTH (Thyrotropic Hormone, also known as Thyroid-Stimulating Hormone or TSH)

The release of TTH during stress is extremely variable and dependent upon a number of conditioning factors.

In wild rabbits, frightening stimuli may cause concomitant adrenocortical enlargement and a marked discharge of TTH with thyroid hypertrophy, and only the latter is inhibited by methylthiouracil.

In the rat, exposure to cold enhances TTH release, even when ACTH secretion is blocked by dexamethasone.

Mild stressors decreased plasma TTH and correspondingly raised plasma ACTH and corticoid concentrations in the rat. These observations would agree with the "pituitary-shift" theory. On the other hand, chronic stress leads to continuously-increased resting levels of plasma TTH.

A review of the literature shows that stress can either increase or decrease TTH secretion depending upon conditions (intensity and duration of stress, type of stressor used) and the animal species examined. This might explain the many apparent contradictions in the pertinent literature.

TTH

(See also our earlier stress monographs, p. xiii)

Kracht, J., Spaethe, M.: "Ueber Wechselbeziehungen zwischen Schilddrüse und Nebennierenrinde. II. Mitteilg. Untersuchungen

über den 'Hypophysenhemmstoff' p-Oxypropiophenon" (Interrelation between the thyroid and the adrenal cortex. II. Report. Studies on the "hypophyseal inhibitor" p-oxypropiophenone). *Virchows Arch. [Pathol. Anat.]* **323**: 629-644 (1953).

B85,143/53

Wild rabbits respond to frightening stimuli not only with adrenocortical enlargement but also with a marked discharge of TTH which causes thyroid hypertrophy. This peculiar response can be prevented by hypophysectomy or methylthiouracil.

Goldman, H.: "Effect of acute stress on the pituitary gland: endocrine gland blood flow." *Endocrinology* **72**: 588-591 (1963).

D60,687/63

In rats, the blood flow through the pituitary, adrenal, thyroid and ME was determined using ^{86}Rb . Under the influence of "ether stress," the blood flow increased within a few minutes in the adenohypophysis and even more in the thyroid. Stress after adrenalectomy caused a marked increase of the blood flow in both the anterior and the posterior pituitary but not in the thyroid. The blood flow in the ME remained unchanged under all these experimental conditions.

Ducommun, P., Sakiz, E., Guillemin, R.: "Dissociation of the acute secretions of thyrotropin and adrenocorticotropin." *Am. J. Physiol.* **210**: 1257-1259 (1966).

F68,175/66

In both normal and dexamethasone-treated rats, mild acute stress inhibits TTH secretion, but this is not necessarily associated with increased ACTH release. TTH secretion in response to cold is enhanced even when ACTH discharge is blocked. [This appears to agree with the concept of a "shift in anterior lobe hormone secretion," in that maximal secretion of one type interferes with the increased discharge of another (H.S.).]

Ducommun, P., Sakiz, E., Guillemin, R.: "Lability of plasma TSH levels in the rat in response to nonspecific exteroceptive stimuli." *Proc. Soc. Exp. Biol. Med.* **121**: 921-923 (1966).

F64,088/66

In rats, mild stressors (handling, transferring from one room to another, intraperitoneal injections) cause a rapid decrease in plasma TTH which is more or less inversely proportional to variations in plasma ACTH and corticoid concentrations.

Salaman, D. F.: "The action of stress on plasma TSH concentration in the rat." *J. Physiol. (Lond.)* **186**: 134P-135P (1966).

G41,626/66

In rats the stress of ether anesthesia produced a rapid drop in plasma TTH which paralleled an increased release of CRF and ACTH. [This short report of an oral com-

munication does not lend itself to definitive evaluation (H.S.).]

Ducommun, P., Vale, W., Sakiz, E., Guillemin, R.: "Reversal of the inhibition of TSH secretion due to acute stress." *Endocrinology* **80**: 953-956 (1967). F83,273/67

In rats, chronic mild stress (transfer from the animal room to the laboratory, handling, brief ether anesthesia at different times of the day) prevents the usual inhibition of TTH secretion by acute stress (sojourn in a noisy centrifuge). This inhibition is reversed by reserpine. Furthermore, chronic stress leads to continuously increased resting levels of plasma TTH.

In rats, both nicotine and ether increased plasma LTH but not TTH. This was ascribed

to stress. Suckling raised the LTH without influencing the TTH level of the plasma.

Mühlen, A. von zur, Lammers, M., Köberling, J., Hesch, R. D.: "TSH, T_3 and corticosterone in rats under various environmental conditions and after L- T_3 and D- T_3 administration" (abstracted). *Endocrinol. Exp.* **8**: 237 (1974). H89,185/74

In rats, various stressors (restraint, anesthesia, change of cage) raised plasma TTH and corticosterone values in approximately parallel fashion.

Rall, J. E.: "The role of the thyroid in endocrine control mechanisms." *Perspect. Biol. Med.* **17**: 218-226 (1974).

H81,929/74

A survey of the literature shows that stress can increase or decrease TTH secretion depending upon conditions and the species examined. The author concludes that, in general, stress mildly inhibits thyroid hormone secretion, but for example, in sheep the fear of a barking dog in an adjacent cage causes a rise in the thyroid hormone concentration of the thyroid vein.

Thyroid Hormones

The behavior of the pituitary-thyroid axis during stress becomes even more difficult to evaluate when we use the evidence of thyroid hormone secretion as an indicator.

In rats, the concentration of radioiodine in the thyroid and its distribution in the serum are influenced by a variety of stressors. EP and corticoids decrease serum protein-bound iodine, while fasting, cold or heat diminishes the radioiodine content of the thyroid. Decreased thyroid function has also been observed in rats stressed by formaldehyde, as indicated by a diminished uptake of radioiodine by the thyroid.

Allegedly, electroshock, swimming in cold water and EP at first inhibited radioiodine uptake by the rat thyroid even after hypophysectomy or adrenalectomy; the reverse was true twenty-four hours after application of the stressors. The acute response was ascribed to the release of a vasoconstrictor substance and the delayed reaction to increased TTH secretion.

Fractures of the femur cause a transient rise in the thyroxine secretion of the rat without any change in serum thyroxine or PBI. However, some authors maintain that free thyroxine and free T_3 rapidly rise in rat plasma after injuries, whereas the thyroxine-binding capacity of serum albumin falls. All these factors may influence thyroid function during stress.

Rats frightened by the presence of a dog showed a heightened radioiodine uptake and serum PBI with histologic changes in the thyroid indicative of increased function. "These observations suggest that experimental thyrotoxicosis can be produced in animals using this method."

In rabbits, various emotional (electroshock, restraint, light) and physical (trauma, hemorrhage) stressors induced a prompt inhibition of thyroid activity lasting one or two days, as evidenced by the release of radiolabeled hormones. Neither thyroid denervation nor adrenalectomy prevented this response. (*Cf.* TTH on p. 488.)

In the horse, adaptation to cold and muscular exercise raises the thyroxine secretion rate, as judged by labeled thyroxine determinations.

In man, during the acute phase of infection, the turnover of thyroxine was accelerated. In elderly persons, decreased thyroxine turnover under basal conditions appears to result from enhanced disposal rather than diminished secretion of the hormone.

Sleep deprivation augmented serum PBI in man concurrently with increased EP and NEP excretion.

In summary, we must conclude that an effect of stress upon thyroid function itself—like its influence on TTH secretion—is definitely demonstrable, but its intensity and direction depend on so many conditioning factors that generalizations would be difficult to make at this time.

Thyroid Hormones

(See also our earlier stress monographs, p. xiii)

Williams, R. H., Jaffe, H., Kemp, C.: "Effect of severe stress upon thyroid function." *Am. J. Physiol.* **159**: 291-297 (1949).

B43,573/49

In rats the concentration of radioiodine by the thyroid and its distribution in the serum are influenced by EP, trauma and typhoid vaccine. EP and adrenocortical extract decrease the quantity of PBI in the serum. Fasting, cold and heat diminish the concentration of radioiodine in the thyroid.

Paschkis, K. E., Cantarow, A., Eberhard, T., Boyle, D.: "Thyroid function in the alarm reaction." *Proc. Soc. Exp. Biol. Med.* **73**: 116-118 (1950). B46,261/50

"Rats under the influence of an alarming stimulus (formalin injection) showed decrease in thyroid function, the latter evidenced by diminished uptake of I-131 per milligram of thyroid tissue. Desoxycorticosterone acetate and adrenal cortical extract failed to influence thyroid uptake of I-131 significantly." These findings confirm "Selye's statement that the thyroid 'atrophy' is observed early during the alarm reaction."

Badrick, F. E., Brimblecombe, R. W., Reiss, J. M., Reiss, M.: "The influence of stress conditions on the uptake of ^{131}I by the rat thyroid." *J. Endocrinol.* **11**: 305-313 (1954). C279/54

Various stressors (electroshock, swimming in cold water, intraperitoneal EP) rapidly in-

hibit the uptake of ^{131}I by the thyroid in both intact and hypophysectomized or adrenalectomized rats. On the other hand, uptake of ^{131}I by the thyroid is increased twenty-four hours after application of the stressors. The acute response is ascribed to the release of a vasoconstrictor substance, whereas the delayed reaction is attributed to TTH secretion by the anterior pituitary.

Brown-Grant, K., Harris, G. W., Reichlin, S.: "The effect of emotional and physical stress on thyroid activity in the rabbit." *J. Physiol. (Lond.)* **126**: 29-40 (1954).

C6,508/54

In rabbits, various emotional (electroshock, restraint, light) and physical (trauma, hemorrhage, turpentine injection) stressors induced a prompt inhibition (lasting one to two days) in thyroid release of ^{131}I -labeled hormone. Neither thyroid denervation (steliate ganglionectomy) nor adrenalectomy prevented this inhibition.

Hetzel, B. S., Schottstaedt, W. W., Grace, W. J., Wolff, H. G.: "Changes in urinary nitrogen and electrolyte excretion during stressful life experiences, and their relation to thyroid function." *J. Psychosom. Res.* **1**: 177-185 (1956). E83,418/56

Studies on serum PBI, urine flow, total nitrogen, sodium and potassium "suggest that the thyroid may be participating in a rapid metabolic adjustment, but the mechanism involved is not clear from existing knowledge of the thyroid hormone."

Alexander, F., Flagg, G. W., Foster, S., Clemens, T., Blahd, W.: "Experimental

studies of emotional stress: I. Hyperthyroidism." *Psychosom. Med.* **23**: 104-114 (1961).

H6,457/68

During conditioned avoidance sessions, plasma thyroid hormone levels exhibit low but prolonged elevations without any evidence of eventual exhaustion (28 refs.).

Negoescu, I., Constantinesco, A., Don, M., Helteanu, C.: "Le stress et le transport des hormones thyroïdiennes" (Stress and transport of thyroid hormones). *Rev. Roum. Endocrinol.* **6**: 215-220 (1969). J15,906/69

In rats subjected to the stressor effect of repeated exposure to a magnetic field, the free thyroxine content of the blood was raised, whereas the albumin-bound fraction was diminished. PBI was not significantly altered (22 refs.).

Fröberg, J., Karlsson, C. G., Levi, L., Lidberg, L., Seeman, K.: "Conditions of work and their influence on psychological and endocrine stress reactions." *Lab. Clin. Stress Res.* (Stockh.) Rep. No. 8: 1-19 (1969).

G69,180/69

In Swedish officers deprived of sleep for seventy-five hours and performing on an

electronic shooting range or engaged in military staff work, EP and NEP excretion was increased, as were erythrocyte sedimentation and the amount of PBI, whereas serum iron was decreased. Some subjects developed ECG anomalies, particularly ST-T depression, and it took several days of rest for ECG patterns to return towards normal. Stressors imitating situations in civilian life produced essentially similar changes in proportion to their severity.

Richards, J. R., Harland, W. A., Orr, J. S.: "Factors affecting thyroid hormone metabolism in experimental trauma." In: Németh, Š., *Hormones, Metabolism and Stress. Recent Progress and Perspectives*, pp. 151-161. Bratislava: Slovak Academy of Sciences, 1973. E10,465/73

In rats, fractures of the femur cause a transient increase in thyroxine secretion without any change in serum thyroxine or PBI. Others have shown that free thyroxine and T₃ levels in plasma rise rapidly after injuries, whereas the thyroxine-binding capacity of prealbumin decreases. "These alterations in the peripheral metabolism and transport of thyroxine may well play an important role in the metabolic consequences of injury."

Story, J. A., Griffith, D. R.: "Effect of ex-

ercise on thyroid hormone secretion rate in aging rats." *Horm. Metab. Res.* **6**: 403-406 (1974). H97,134/74

Gupta, R. C., Prasad, G. C., Udupa, K. N.: "Experimental production of thyrotoxicosis." *5th Asia and Oceania Congr. Endocr.*, p. 178. Chandigarh, India, 1974. H82,223/74

Rats exposed to fear by being kept in front of a dog's cage showed enhanced ¹³¹I uptake and increased PBI with histologic changes in the thyroid indicative of thyrotoxicosis. The serum cholesterol and body weight were lowered. "These observations suggest that experimental thyrotoxicosis can be produced in animals using this method."

Carter, J. N., Eastman, C. J., Corcoran, J. M., Lazarus, L.: "Effect of severe, chronic illness on thyroid function." *Lancet* October 26, 1974, pp. 971-974. H94,571/74

In patients with severe, chronic, nonthyroidal illnesses the mean total serum-T₃ levels are reduced to the hypothyroid range, apparently as a result of decreased conversion of T₄ to T₃. Depressed production of TTH-RF secondary to stress or undernutrition may also contribute by reducing thyroidal hormone output. [The apparently contrary observations on hyperthyroidism precipitated by stress are not discussed (H.S.).]

MTH (Melanotropic Hormone, also known as Melanophore-Stimulating Hormone or MSH)

Very little is known about the participation of the intermediate lobe hormone in the stress response. Besides, in several species, including man, the intermediate lobe is not clearly developed.

In lizards, a neuro-intermediate lobe grafted below the skin produces a small dark patch owing to MTH discharge; exposure to stressors enlarges the size of the pigmented area, presumably because of MTH release from the graft.

A review of the literature concerning plasma MTH in man revealed no clearcut correlation between the level of this hormone and that of cortisol during various diseases. A rise in plasma MTH was very pronounced after brain injury but this may have been a specific effect.

MTH

(See also our earlier stress monographs, p. xiii)

Vargas, L.: "Influencia de diferentes tipos de tensión o violencia sobre el nivel san-

guíneo de hormona melanofórica hipofisaria en el hombre" (Influence of different types of stress on pituitary melanophoric hormone blood levels in humans). *Arch. Biol. Med. Exp.* (Santiago) **1**: 210-215 (1964). G23,160/64

In man, various stressors (electroshock, emotional arousal, pregnancy, surgery) increase the MTH content of the blood. This response "could be a part of the adaptive neuro-endocrine mechanism of the stress."

Sandman, C. A., Kastin, A. J., Schally, A. V., Kendall, J. W., Miller, L. H.: "Neuroendocrine responses to physical and psychological stress." *J. Comp. Physiol. Psychol.* **84**: 386-390 (1973). J5,207/73

In rats, endogenous plasma levels of MTH and ACTH following various stressors were increased although neurogenic stressors were more effective in raising MTH. It is suggested that the latter "may facilitate adaptive behavior by leading to increased attention or awareness of the environment."

Novales, R. R.: "Actions of melanocyte-stimulating hormone" In: Greep, R. O. and Astwood, E. B., *Handbook of Physiology. Section 7. Endocrinology*, Vol. 4, Part 2, pp. 347-366. Washington, D.C.: American Physiological Society, 1974. E10,757/74

Meurling, P., Klefbohm, B., Larsson, L.: "Transplantation of the pars intermedia in an elasmobranch and a lizard." *Gen. Comp. Endocrinol.* **22**: 347 (1974). H83,146/74

In the lizard (*Anolis carolinensis*) the neuro-intermediate lobe grafted below the dorsal skin produces a distinct small dark patch owing to MTH discharge. Exposure to stressors (kind not described) causes a rapid release of MTH.

Kastin, A. J., Hawley, W. D., Miller, M. C., Schally, A. V., Lancaster, C.: "Plasma MSH and cortisol levels in 567 patients with special reference to brain trauma." *Endocrinol. Exp.* (Bratisl.) **8**: 97-105 (1974).

H88,653/74

The literature on MTH release in response to stress is reviewed. Personal observations revealed that patients with various diseases showed no correlation between elevations in plasma cortisol and MTH. A rise in the latter was particularly pronounced with brain trauma.*

Vasopressin (Antidiuretic Hormone or ADH) and Oxytocin

In the section concerned with theories relating to the mechanism of the stress reaction, much will have to be said about vasopressin as a possible neurohumoral factor regulating ACTH secretion and its previously-suspected identity with CRF. It has long been known that vasopressin is released during emotional stress. This results in a delay of diuresis following a water load, which can in turn be prevented by EP or tyramine. Evidently, the end result of stress upon water diuresis will depend upon the relative production of vasopressin and EP.

Similar discrepancies between the relative amounts of various stimulators and inhibitors of some parameters influenced by stress probably explain why a parameter known to be stress dependent, can respond in diametrically opposed ways under different conditions.

In dogs, the surgical trauma of gastrectomy increases vasopressin secretion about thirtyfold. This effect is not modified by vagotomy but is abolished by cervical cordotomy. Presumably, ascending spinal pathways mediate this response to stress. Vasopressin discharge caused by stress (sound, ether) has also been noted in the garden dormouse. In man, a rise in plasma vasopressin levels was noted after various surgical interventions and anesthesia. Hence, it may be accepted as a well-established fact that a discharge of vasopressin is a characteristic manifestation of stress in various species.

Quite a few investigators have examined oxytocin secretion during stress, and there appears to be unanimity among these authors that the neurohypophyseal concentration of this hormone rises following exposure to various stressors.

Insulin

(See also Diabetes Mellitus and Hyperinsulinism under Diseases of Adaptation)

The literature on the effect of stressors upon insulin secretion, and particularly, upon its plasma level is difficult to interpret. In some instances, rises, in others no change or drops, of insulinemia were noted.

These apparent contradictions are almost certainly due to the fact that insulin secretion during stress depends upon a variety of conditioning agents. EP, which is also released during stress, inhibits insulin discharge as does hypoglycemia, whereas glucagon and hyperglycemia augment its secretion, presumably acting as homeostatic mechanisms that help maintain a steady blood sugar level. Stress increases plasma glucagon and may either raise or depress blood sugar, depending mainly upon the availability of carbohydrate stores, the speed of their utilization, as well as the severity, duration and specific side-effects of the stressors applied. In addition, the gluco-

corticoids discharged during stress may cause pronounced changes in glycogen reserves and blood sugar.

In view of all these modifying factors, it is hardly surprising that the literature on the effect of stress upon the plasma insulin level is very contradictory and unsuitable for generalizations. Perhaps the only valid conclusion that can be drawn is that stress, either directly or through its effect on the conditioning agents just enumerated, can produce pronounced changes in the plasma insulin concentration.

The complexity of this situation is well illustrated by experiments on rats which showed that trauma can completely suppress the rise in plasma immunoreactive insulin, normally elicited by intravenous glucose. This blockade is in turn prevented by removal of the adrenal medulla, the main source of the inhibitory EP.

Insulin

(See also our earlier stress monographs, p. xiii)

Gellhorn, E., Feldman, J., Allen, A.: "Effect of emotional excitement on the insulin content of the blood. Contribution to physiology of the psychoses." *Arch. Neurol. Psychiatry* **47**: 234-244 (1942).

A37,798/42

In psychotic patients, emotional excitement considerably increases the blood insulin level, although blood sugar usually remains unaffected. In normal persons, excitement causes a rise in blood sugar but not in plasma insulin. "The experiments are interpreted to mean that the balance of the autonomic centers in psychotic patients under emotional stress is shifted toward the vagoinsulin side whereas in normal persons the sympatheticoadrenal system greatly predominates."

Schalch, D. S.: "The effect of physical stress and exercise in the human on growth hormone and insulin secretion." *Clin. Res.* **13**: 334 (1965).

F61,179/65

In man, various stressors (muscular exercise, electroconvulsive therapy, major surgery) increased plasma STH (radioimmunoassay) and FFA levels without affecting plasma insulin. It is possible that STH discharge "may be at least in part responsible for the mobilization of the readily oxidizable FFA which takes place during periods of increased energy requirements."

Baumann, R.: "Die Bedeutung des Stress für die Regulation des Kohlenhydratstoffwechsels und den Insulineffekt" (The effect of stress on insulin hypoglycemia, and the metabolism of carbohydrates in general). *Zentralbl. Chir.* **92**: 1324-1334 (1967).

F91,158/67

In rats, psychogenic stress increases the

blood sugar level and makes insulin hypoglycemia and the associated shock phenomena more intense and acute, although the latter are not directly dependent upon the dose of insulin or the blood sugar level.

Schalch, D. S.: "The influence of physical stress and exercise on growth hormone and insulin secretion in man." *J. Lab. Clin. Med.* **69**: 256-269 (1967).

G44,274/67

In man, plasma STH often rose during periods of physical stress or exercise, while insulin values remained unchanged or decreased. EP did not reproduce the release of STH. The failure of plasma insulin levels to rise in response to stress-induced hyperglycemia is consistent with the finding that EP infusion impairs insulin discharge. Plasma glucose and FFA levels rose as expected during physical exercise. Presumably, certain stressors are diabetogenic not only because of EP and corticoid release but also because of a discharge of STH on the one hand and an EP-induced suppression of insulin secretion on the other.

Mason, J. W., Wherry, F. E., Brady, J. V., Beer, B.: "Plasma insulin response to 72-hr. avoidance sessions in the monkey." *Psychosom. Med.* **30**: 746-759 (1968).

H6,462/68

"Emotional reactions to venipuncture may also elicit a decrease in plasma immunoreactive insulin levels with associated elevations in plasma 17-OHCS and glucose levels."

Wright, P. H., Malaisse, W. J.: "Effects of epinephrine, stress, and exercise on insulin secretion by the rat." *Am. J. Physiol.* **214**: 1031-1034 (1968).

F97,956/68

In rats, various stressors (EP, swimming, electroshock) diminish insulin secretion. "It is suggested that endogenous epinephrine released during stress or exercise is sufficient to

suppress insulin secretion even under conditions of hyperglycemia" (29 refs.).

Carey, L. C., Lowery, B. D., Cloutier, C. T.: "Blood sugar and insulin response of humans in shock." *Ann. Surg.* **172**: 342-350 (1970). G77,785/70

Within minutes, patients in traumatic hypovolemic shock develop severe hyperglycemia which falls gradually as resuscitation progresses, but which is still high after five hours. The serum insulin is unresponsive to the hyperglycemia of shock.

Bottger, I., Faloona, G. R., Unger, R. H.: "The effect of intensive physical exercise on pancreatic glucagon secretion." *Diabetes* **20** Supp. 1: 339 (1971). J10,799/71

In the dog and in man the blood glucagon level rose during physical exercise, probably contributing to the associated hyperglycemia. Blood insulin concentrations varied less regularly.

Hartley, L. H., Mason, J. W., Hogan, R. P., Jones, L. G., Kotchen, T. A., Mougey, E. H., Wherry, F. E., Pennington, L. L., Ricketts, P. T.: "Multiple hormonal responses to graded exercise in relation to physical training." *J. Appl. Physiol.* **33**: 602-606 (1972).

H79,757/72

In man the stress of heavy bicycle exercise increased plasma STH, cortisol and EP values, but decreased insulin concentration.

Hoffmann, H. D., Fiedler, H., Gürtler, H., Kibittel, W.: "Der Einfluss von Fahrradergometerarbeit, Sparring und Wettkampf auf die Plasmainsulinkonzentration und den Blutzuckerspiegel bei Boxern" (The influence of muscular exercise [bicycle ergometer], sparring, and competition on the plasma insulin concentration and blood sugar level in boxers). *Med. Sport (Berl.)* **12**: 119-123 (1972). H90,857/72

Fekete, M., Milner, R. D. G., Soltész, G., Assan, R., Mestyán, J.: "Plasma glucagon, thyrotropin, growth hormone and insulin response to cold exposure in the human newborn." *Acta Paediatr. Scand.* **61**: 435-441 (1972). G92,222/72

In full-term and premature babies, exposure to cold caused no significant change in plasma insulin, glucagon, STH or TTH concentration.

Meguid, M. M., Brennan, M. F., Muller, W. A., Aoki, T. T.: "Glucagon and trauma." *Lancet* November 25, 1972, p. 1145.

H62,755/72

In six patients who sustained major trauma, plasma glucagon rose considerably within eighteen hours. Plasma insulin levels did not change significantly, but maximal hyperglycemia preceded the glucagon peak. Literature is cited to show that hypoglycemia, starvation, diabetic ketoacidosis and exercise likewise caused hyperglucagonemia. Hence, glucagon appears to play a role in the pathophysiology of severe trauma.

Bloom, S. R., Daniel, P. M., Johnston, D. I., Ogawa, O., Pratt, O. E.: "Release of glucagon, induced by stress." *Q. J. Exp. Psychol.* **58**: 99-108 (1973). G99,793/73

In both conscious and lightly anesthetized (pentobarbital) rhesus monkeys startled by noise, plasma glucagon rose rapidly, followed by elevation of blood glucose but not of plasma insulin. Similar effects were produced in anesthetized animals by rectal distension, drilling a burr hole in the skull, and passage of an electric current through the head. "These experiments show that glucagon is rapidly released in response to various types of stress."

Vigaš, M., Németh, Š., Jurčovičová, J.: "Stress-induced inhibition of insulin release in non-conditioned and conditioned rats." In: Németh, Š., *Hormones, Metabolism and Stress. Recent Progress and Perspectives*, pp. 143-150. Bratislava: Slovak Academy of Sciences, 1973.

E10,464/73

Whereas normal rats respond to 1 gm. per kg. intravenous glucose by a prompt rise in plasma immunoreactive insulin, this reaction is completely suppressed after traumatization in the Noble-Collip drum. The blockade is prevented by bilateral adrenomedulllectomy or by repeating the injury daily for seven days (13 refs.).

Wolf, S.: "The challenge of methodology in psychosomatic research with notes on the 'psychic' secretion of insulin." *Tex. Rep. Biol. Med.* **31**: 431-440 (1973).

J9,407/73

In man, "not only was a sense of appetite on viewing breakfast associated with an increase in acid and in insulin secretion, but an increase was also observed in those experiments in which anxiety was aroused because of difficulty with the intravenous needle." It must be kept in mind that hypoglycemia automatically enhances insulin secretion, and since the rise in blood sugar is characteristic of stress, an associated discharge of insulin is not unexpected.

Porte, D. Jr., Robertson, R. P.: "Control of insulin secretion by catecholamines, stress, and the sympathetic nervous system." *Fed. Proc.* **32**: 1792-1796 (1973). H71,915/73

Catecholamines inhibit insulin release by stimulation of pancreatic α -receptors and enhance it by excitation of β -receptors. "Activation of the sympathetic nervous system causes inhibition of glucose-stimulated insulin secretion via the α -receptor, but insulin output is maintained, probably via simultaneous β -receptor stimulation.... Pathological stress states may induce a metabolic state similar to diabetes with hyperglycemia and poor insulin responses to glucose challenge" (68 refs.).

Meguid, M. M., Brennan, M. F., Aoki, T. T., Muller, W. A., Ball, M. R., Moore, F. D.: "Hormone-substrate interrelationships following trauma." *Arch. Surg.* **109**: 776-783 (1974). J19,976/74

Observations in man lead the authors to the conclusion that "in trauma, the gradual rise in glucagon contributes to the increase in concentration of glucose and FFA, and that the cortisol rise synergizes with the elevated glucagon concentration to favor gluconeogenesis from muscle amino acids. Relatively low circulating insulin levels favor these metabolic changes" (62 refs.).

Koch, G.: "Vergleichende Untersuchungen über das Blutglukose- und Plasmainsulinverhalten am traumatisierten Kaninchen" (Blood glucose and plasma insulin levels of traumatized rabbits, an experimental study). *Brunn Beitr. Klin. Chir.* **221**: 158-163 (1974). J17,605/74

In rabbits, surgical trauma causes hyperglycemia and an increase in plasma insulin, both of which are ascribed to the G.A.S.

Singh, A. K., Chansouria, J. P. N., Singh, R. K., Wahi, R. S., Udupa, K. N.: "Hormonal and metabolic alterations following surgical trauma." *5th Asia and Oceania Congr. Endocr.*, pp. 50-51. Chandigarh, India, 1974. H82,068/74

In patients the stress of major surgery caused an increase in plasma STH, cortisol and FFA, with a decrease in plasma insulin.

Ivanova, I. I., Lapshina, V. F., Tsaplin, V. M.: "Corticosterone content in the peripheral blood and adrenal glands during stress in rats with alloxan diabetes." *Probl. Endokrinol.* **20** No. 3: 94-97 (1974) (Russian).

In rats, alloxan diabetes did not significantly influence the typical stress reaction to sian). H92,322/74

trauma. They showed adrenal enlargement, thymus involution and elevated corticosterone levels in the plasma and adrenals.

Demael-Suard, A., Garin, D., Brichon, G., Mure, M., Peres, G.: "Neoglycogenèse à partir de la glycine ^{14}C chez la tanche (*Tinca vulgaris* L.) au cours de l'asphyxie" (Neoglycogenesis from glycine ^{14}C in the tench [*Tinca vulgaris* L.] during asphyxia). *Comp. Biochem. Physiol. [A]* **47**: 1023-1033 (1974). H82,645/74

In the tench, increased cortisol, catecholamine and insulin secretions produce changes in carbohydrate metabolism which are ascribed to the stress of handling and asphyxia.

Unger, R. H.: "Alpha- and beta-cell interrelationships in health and disease." *Metabolism* **23**: 581-593 (1974). H86,900/74

"An inappropriately low concentration of insulin and/or high level of glucagon relative to fuel availability are observed in genetic diabetes, and in a variety of stressful illnesses such as severe infection, trauma, burns, fetal distress, and other conditions, all of which are characterized by a negative nitrogen balance" (88 refs.).

Wright, P. D., Henderson, K., Johnston, I. D. A.: "Glucose utilization and insulin secretion during surgery in man." *Br. J. Surg.* **61**: 5-8 (1974). H86,335/74

In man, various surgical operations depress glucose utilization, thereby decreasing resistance. "Suppression of insulin secretion was observed during operation together with increased plasma cortisol levels and an increased urinary catecholamine excretion. It is suggested that a failure of cellular glucose utilisation is the primary event in the metabolic response to injury which initiates cellular catabolism and urinary nitrogen loss."

Woods, S. C., Porte, D. Jr.: "Neural control of the endocrine pancreas." *Physiol. Rev.* **54**: 596-619 (1974). H89,399/74

Extensive review on factors influencing the endocrine activity of the pancreas with a special section on "stress states."

Vigaš, M., Németh, Š., Jurčovičová, J.: "Posttraumatic regulation of insulin secretion in adapted rats." *Physiol. Bohemoslov.* **23**: 245-249 (1974). J14,698/74

In rats, there is a rapid increase in the plasma immunoreactive insulin level after intravenous glucose, but not if this is preceded by traumatization in the Noble-Collip

drum. EP blocks the postglucose insulin secretion in nonadapted rats, but not in those adapted to trauma. "It is assumed that the posttraumatic change in insulin secretion in

adapted rats is caused by greater degradation of catecholamines, or by lower adrenaline sensitivity of the beta cells in the islets of Langerhans."

Glucagon

In man, both starvation and posttraumatic stress induce a characteristic catabolic response. Here, the discharge of glucagon probably plays a very important role in that it antagonizes stress-produced insulin resistance and supplies glucose as a readily available source of energy. Of course, catecholamines and glucocorticoids undoubtedly also contribute to the development of stress-induced hyperglycemia.

The plasma level of glucagon is regularly raised by various stressors, such as diverse forms of traumatic injuries, noise, muscular effort, fasting, infections, burns, cardiac infarctions and so on, both in experimental animals and in man. Hence, glucagon has been designated as a "stress hormone."

Despite the associated hyperglycemia, the stress-induced glucagon secretion is usually not accompanied by any significant change in plasma insulin, but it may lead to some degree of insulin resistance and aggravate pre-existent or latent diabetes. Its discharge has been suspected of being predominantly under sympathetic control.

The few available data concerning glucagon discharge in fetal and earliest postnatal life are somewhat contradictory.

Glucagon

(See also our earlier stress monographs, p. xiii)

Aguilar-Parada, E., Eisentraut, A. M., Unger, R. H.: "Effects of starvation on plasma pancreatic glucagon in normal man." *Diabetes* 18: 717-723 (1969). H18,441/69

Through the use of a relatively specific antiserum for pancreatic glucagon, the blood level of the latter was found to rise considerably during starvation in man. Literature is cited showing that insulin, phlorhizin, certain sulfonylurea derivatives, arginine and various other amino acids likewise cause hyperglucagonemia, and apparently the hormone is secreted in excess whenever a glucose need arises (23 refs.).

Carlo, P. E.: "Nutritional therapy in surgery and trauma. Metabolic consequences of nutritional restriction and stress." *Agrestologie* 12: 303-324 (1971). H51,864/71

Review on the effects of nutritional therapy upon the metabolic consequences of trauma and other forms of stress. The so-called "obligatory, post-traumatic nitrogen loss" is part of the G.A.S., facilitated by but not entirely dependent upon glucocorticoids. In acute stress, glycogenesis becomes es-

sential, at the expense of proteins, to furnish a rapidly available source of energy. Lysosomes supply the enzymes required to catabolize proteins or synthesize sugar. Glucagon probably plays a very important role here as it depresses insulin and stimulates lysosomal activity, thereby combatting stress-induced, post-traumatic insulin resistance, since insulin inhibits glycogenesis. The main pertinent questions are answered as follows: "a) post-traumatic nitrogen loss is due to starvation and stress; b) it is harmful because of the protein loss and metabolic imbalances it induces; c) it can be prevented or considerably limited by preventing the development of intense glycogenesis before surgery, and pharmacological control of adrenergic reactions; d) it helps the patient because it decreases the chances and severity of complications and speeds up recovery." In severe surgical stress, parenteral nutrition is advocated.

Bottger, I., Falonna, G. R., Unger, R. H.: "The effect of intensive physical exercise on pancreatic glucagon secretion." *Diabetes* 20 Supp. 1: 339 (1971). J10,799/71

In the dog and in man the blood glucagon level rose during physical exercise, probably contributing to the associated hyperglycemia.

Blood insulin concentrations varied less regularly.

Felig, P., Wahren, J., Handler, R., Ahlborg, G.: "Plasma glucagon levels in exercising man." *N. Engl. J. Med.* **287**: 184-185 (1972). H57,196/72

In man, plasma glucagon levels rise following forty minutes of exercise on a bicycle ergometer.

Bloom, S. R., Daniel, P. M., Johnston, D. I., Ogawa, O., Pratt, O. E.: "Changes in glucagon level associated with anxiety or stress." *Psychol. Med.* **2**: 426-427 (1972). G98,403/72

In monkeys [kind not mentioned (H.S.)] a sudden loud noise produced a large and rapid rise in plasma glucagon, even during ether anesthesia.

Meguid, M. M., Brennan, M. F., Muller, W. A., Aoki, T. T.: "Glucagon and trauma." *Lancet* November 25, 1972, p. 1145.

H62,755/72

In six patients who sustained major trauma, plasma glucagon rose considerably within eighteen hours. Plasma insulin levels did not change significantly, but maximal hyperglycemia preceded the glucagon peak. Literature is cited to show that hypoglycemia, starvation, diabetic ketoacidosis and exercise likewise caused hyperglucagonemia. Hence, glucagon appears to play a role in the pathophysiology of severe trauma.

Fekete, M., Milner, R. D. G., Soltész, G., Assan, R., Mestyán, J.: "Plasma glucagon, thyrotropin, growth hormone and insulin response to cold exposure in the human newborn." *Acta Paediatr. Scand.* **61**: 435-441 (1972). G92,222/72

In full-term and premature babies, exposure to cold caused no significant change in plasma insulin, glucagon, STH or TTH concentration.

"Glucagon and diabetes." *Br. Med. J.* August 11, 1973, pp. 310-311. H74,266/73

Letter to the editor summarizing evidence showing that "in a variety of stressful conditions the secretion of glucagon may be stimulated by the sympathetic nervous system." It is of clinical importance that stress-induced hyperglucagonemia contributes to the deterioration of diabetic control in patients kept on standard dosages of insulin.

Bloom, S. R., Daniel, P. M., Johnston, D. I., Ogawa, O., Pratt, O. E.: "Release of glucagon, induced by stress." *Q. J. Exp. Psychol.* **58**: 99-108 (1973). G99,793/73

In both conscious and lightly anesthetized (pentobarbital) rhesus monkeys startled by noise, plasma glucagon rose rapidly, followed by elevation of blood glucose but not of plasma insulin. Similar effects were produced in anesthetized animals by rectal distension, drilling a burr hole in the skull and passage of an electric current through the head. "These experiments show that glucagon is rapidly released in response to various types of stress."

Bloom, S. R.: "Glucagon, a stress hormone." *Postgrad. Med. J.* **49** Supp.: 607-611 (1973). J6,093/73

Glucagon is designated a "stress hormone." Its plasma level rises sharply in different species following exposure to various stressors. Presumably, its usefulness lies in the fact that it releases glucose from hepatic glycogen stores and activates hepatic glycogenesis, thereby supplying energy to satisfy increased requirements during stress.

Laniado, S., Segal, P., Esrig, B.: "The role of glucagon hypersecretion in the pathogenesis of hyperglycemia following acute myocardial infarction." *Circulation* **48** Supp. 4, 797-800 (1973). J6,374/73

In nondiabetic patients, postinfarction hyperglycemia tends to be associated with an increase in plasma glucagon concentration. Presumably, in "certain cases, hyperglycemia following acute myocardial infarction may be related to a temporary and uninhibited rise in plasma glucagon levels, probably stimulated by the major stress of acute myocardial infarction."

Lindsey, A., Santeusonio, F., Braaten, J., Falloona, G. R., Unger, R. H.: "Pancreatic alpha-cell function in trauma." *J.A.M.A.* **227**: 757-761 (1974). H82,359/74

In patients with traumatic shock, plasma glucagon levels rose far above normal and blood glucose averaged 188 mg. per 100 ml., whereas insulin levels remained unchanged. "In three patients undergoing major surgery without associated hypotension, glucagon concentrations did not rise comparably. Hyperglucagonemia without a proportional rise in insulin may be the usual islet cell response to severe trauma and possibly could contribute to survival."

Unger, R. H.: "Alpha- and beta-cell interrelationships in health and disease." *Metabolism* **23**: 581-593 (1974). H86,900/74

"An inappropriately low concentration of insulin and/or high level of glucagon relative to fuel availability are observed in genetic

diabetes, and in a variety of stressful illnesses such as severe infection, trauma, burns, fetal distress, and other conditions, all of which are characterized by a negative nitrogen balance" (88 refs.).

Harvey, W. D., Faloona, G. R., Unger, R. H.: "The effect of adrenergic blockade on exercise-induced hyperglucagonemia." *Endocrinology* **94**: 1254-1258 (1974).

H85,696/74

In rats, forced swimming increases the plasma glucagon level. This response can be prevented by pretreatment with the α -adrenergic blocker phentolamine, but not by propranolol. Presumably, exercise-induced hyperglucagonemia is largely mediated by α -adrenergic stimulation.

Schwiller, P.O., Schellerer, W., Reitzenstein, M., Hermanek, P.: "Hyperglucagonemia, hypocalcemia and diminished gastric blood flow—evidence for an etiological role in stress ulcer of rat." *Experientia* **30**: 824-826 (1974).

H90,543/74

In both intact and adrenalectomized rats, restraint causes gastric ulcers with a considerable rise in glucagon and a decrease in gastrin which are attributed to stress.

Thorner, M. O., Bloom, S. R.: "Rapid glucagon release in artificial fever." *Lancet*

September 14, 1974, p. 654. H91,868/74

In men, artificial fever produced by bacterial endotoxin causes a rapid increase in plasma glucagon, interpreted as "part of the primary pyrexial stress response."

Drucker, M. R., Pinsky, F., Brown, R. S., Elwyn, D. H.: "The interaction of glucagon and glucose on cardiorespiratory variables in the critically ill patient." *Surgery* **75**: 487-495 (1974). J11,745/74

Meguid, M. M., Brennan, M. F., Aoki, T. T., Muller, W. A., Ball, M. R., Moore, F. D.: "Hormone-substrate interrelationships following trauma." *Arch. Surg.* **109**: 776-783 (1974).

J19,976/74

Observations in man lead the authors to the conclusion that "in trauma, the gradual rise in glucagon contributes to the increase in concentration of glucose and FFA, and that the cortisol rise synergizes with the elevated glucagon concentration to favor gluconeogenesis from muscle amino acids. Relatively low circulating insulin levels favor these metabolic changes" (62 refs.).

Russell, R. C. G., Walker, C. J., Bloom, S. R.: "Hyperglucagonaemia in the surgical patient." *Br. Med. J.* January 4, 1975, pp. 10-12.

H97,996/75

Catecholamines and Their Derivatives

Ever since 1911, when Cannon showed that asphyxia or electric stimulation of the sciatic nerve increases EP secretion in the cat (even under anesthesia), the release of catecholamines and their metabolites has been found to be one of the most reliable indicators of acute stress reactions. This phenomenon, occurring after exposure to the most diverse stressors, in man as in virtually every experimental animal, has been studied by innumerable investigators. Hence, it would require a special monograph to survey the entire pertinent literature and particularly to offer a meaningful résumé of all these studies. The interested reader will find at least brief summaries of the highlights in the following abstract section, but here we shall have to limit ourselves to a few of the most striking generalizations that appear to be justified.

There can be no doubt that the catecholamine discharge is a nonspecific consequence of exposure to the most diverse acute stressors (emotional arousal, pain, hemorrhage, trauma, anesthesia, burns and so on) but it appears to play a much less significant, or even negligible, role during later phases of the G.A.S.

The discharges of EP and NEP do not necessarily run parallel. It has been claimed that aggression is likely to be associated with increased excretion of NEP, whereas tense, anxious, but passive emotional display is related to enhanced excretion of EP, often without any significant concomitant rise in the elimination of NEP.

In young men exposed to the "gravitational stress" of centrifugation, increased

secretion of EP has been ascribed primarily to emotional factors, whereas NEP release is allegedly more closely related to physical changes, such as hemodynamic disturbances. Increased release of either of these catecholamines is associated with a commensurate rise in their common urinary metabolite, vanillylmandelic acid (VMA).

Gravitational stress (centrifugation) increased EP but not NEP excretion or the pulse rate of medical students. Furthermore, gravitational, cold and psychogenic stress involving exhilarating or aggressive reactions caused a predominant excretion of NEP, whereas apprehension, anxiety, pain or discomfort was accompanied by an increase in EP discharge (Euler).

In patients undergoing cardiac catheterization, elevated plasma levels of EP and NEP were associated with decreased insulin concentrations.

Extensive studies have been published comparing the effects of various everyday stressors on catecholamine excretion in man.

The viewing of films causing sexual arousal elicited more pronounced EP and NEP excretion in male than in female students. These changes paralleled self-rating scores in emotional reactions.

It appears to be possible to dissociate the two types of catecholamines produced, even by pharmacologic means. In students the psychogenic stress of examinations increased EP and NEP excretion, but treatment with meprobamate selectively inhibited NEP discharge.

In medical students, various intellectual tests increased urinary EP excretion, which could be suppressed by amphetamine and pentobarbital.

In students carrying out a choice-reaction task and receiving electric shocks either at random or for poor performance, punishment raised both EP and NEP release. By increasing their control over the situation, it was possible to counteract the EP but not the NEP release. On the whole, subjects with high as compared to low rates of EP and NEP excretion performed more efficiently.

In policemen, both understimulation and overstimulation increased NEP release. Subjects excreting more EP performed better during understimulation; those excreting less EP showed better performance during overstimulation.

In men undergoing exacting vigilance tests, the plasma EP and NEP levels were inversely related to glycemia. EP was initially increased but later dropped in proportion to the efficiency of performance, whereas NEP was unrelated to it.

In young men, exposure to cold raised the urinary excretion of both EP and NEP, roughly paralleling the increased oxygen consumption. Presumably, here catecholamines assist in heat regulation.

In man, intense bicycle exercise raised the plasma EP concentration.

In pilots on over-water missions, urinary EP and NEP values were both considerably increased.

In city drivers and their passengers, VMA excretion rises considerably.

Racing driving caused a predominant increase in NEP secretion. Here, plasma NEP values were more constantly elevated than the EP concentration immediately after the race.

In the lamprey, there is a large accumulation of chromaffin cells in the heart which appears to act like the mammalian adrenal medulla. Exposure to cold diminishes its EP content, while the NEP concentration in the liver rises.

In cockerels, immobilization and ACTH increased plasma EP and NEP with a corresponding decrease in adrenal catecholamine levels. It will be recalled that, in birds, the cortical and medullary cells of the adrenal are intermixed.

The role of catecholamines in the regulation of stress responses within the nervous system will be discussed conjointly with other neurohumoral mediators in the section, Theories.

Catecholamines and Their Derivatives

(See also our earlier stress monographs, p. xiii)

Cannon, W. B., Hoskins, R. G.: "The effects of asphyxia, hyperpnoea, and sensory stimulation on adrenal secretion." *Am. J. Physiol.* **29**: 274-279 (1911). 57,883/11

In the cat, asphyxia and electric stimulation of the sciatic nerve, even under anesthesia, caused increased EP secretion.

Humphreys, R. J., Raab, W.: "Response of circulating eosinophils to norepinephrine, epinephrine and emotional stress in humans." *Proc. Soc. Exp. Biol. Med.* **74**: 302-303 (1950). B49,646/50

In medical students the stress of sitting for an examination caused a profound eosinopenia that was much more readily duplicated by EP than by NEP.

Meyer, R. J.: "Relative insensitivity of the hypothalamic-pituitary-adrenal system to activation by epinephrine." *J. Clin. Endocrinol. Metab.* **13**: 123-125 (1953). B77,155/53

Review of previously published and personal observations suggesting that in man the EP test is not a very sensitive indicator of ACTH release. Actually, "epinephrine is quantitatively a poor stimulant of the hypothalamic-pituitary-adrenal system" and hence cannot be accepted as a valid test.

Elmadjian, F., Hope, J. M., Lamson, E. T.: "Excretion of epinephrine and norepinephrine under stress." *Rec. Prog. Horm. Res.* **14**: 513-553 (1958). C57,735/58

Observations on people exposed to various types of stressors "support the hypothesis that active aggressive emotional displays are related to increased excretion of NE, whereas tense, anxious, but passive, emotional displays are related to increased excretion of E in association with normal excretion of NE."

Birke, G., Dunér, H., Liljedahl, S. O., Pernow, B., Plantin, L. O., Troell, L.: "Histamine, catechol amines and adrenocortical steroids in burns." *Acta Chir. Scand.* **114**: 87-98 (1958). J10,862/58

In severely burned patients the blood and urinary histamine, as well as the excretion of EP, NEP and corticoids (17-KGS), were

considerably increased during the first twenty-four hours, but the duration of the rise varied according to the substances examined. Their role in the genesis of burn shock is discussed.

Euler, U. S. von, Gemzell, C. A., Levi, L., Ström, G.: "Cortical and medullary adrenal activity in emotional stress." *Acta Endocrinol. (Kbh.)* **30**: 567-573 (1959).

C66,890/59

Brief technical note on adrenal cortical and medullary activity during emotional stress, based on new techniques of corticoid and catecholamine determinations.

Meehan, J. P., Jacobs, E.: "Venous plasma levels of catechol amines in several physical stresses." *Aerosp. Med.* **31**: 733-738 (1960).

C92,818/60

Berman, M. L., Pettitt, J. A.: "Urinary excretion of 3-methoxy-4-hydroxymandelic acid after several stress situations." *J. Lab. Clin. Med.* **57**: 126-135 (1961). J23,520/61

In healthy subjects, urinary VMA excretion is remarkably stable, but in certain stress situations it rises considerably.

Frankenhaeuser, M., Kareby, S.: "Effect of meprobamate on catecholamine excretion during mental stress." *Percept. Mot. Skills* **15**: 571-577 (1962). E30,225/62

In students, psychogenic stress (problem solving and to a lesser extent even anticipation of such tests) augmented EP and NEP excretion. After simultaneous administration of meprobamate, EP output increased but NEP decreased during stress. Thus, "meprobamate in moderate doses counteracted the increase in the catecholamine response of normal individuals subjected to mental stress in a laboratory situation."

Elmadjian, F.: "Epinephrine, norepinephrine, and aldosterone: release and excretion." In: Schaefer, K. E., *Man's Dependence on the Earthly Atmosphere*, pp. 100-116. New York and London: Macmillan, 1962.

D30,946/62

Studies on EP and NEP secretion during stressful life situations in normal people and psychiatric patients "support the hypothesis that active, aggressive, emotional displays are related to increased excretion of norepineph-

rine, whereas tense, anxious, but passive emotional displays are related to increased excretion of epinephrine." Aldosterone elimination was elevated in certain anxiety states without demonstrable increases in catecholamine excretion. The stressors examined were manipulation of the Hoagland-Werthessen pursuit meter, hockey, boxing, basketball, baseball and anxiety-inducing interviews.

Frankenhaeuser, M., Sterky, K., Jaerpe, G.: "Psychophysiological relations in habituation to gravitational stress." *Percept. Mot. Skills* 15: 63-72 (1962). D46,292/62

In male medical students, gravitational stress (centrifugation) increased EP excretion without causing any pronounced change in NEP elimination or heart rate. After repeated centrifugation, adaptation occurred.

Frankenhaeuser, M., Post, B.: "Catecholamine excretion during mental work as modified by centrally acting drugs." *Acta Physiol. Scand.* 55: 74-81 (1962). D35,589/62

In medical students the stress of various "intellectual tests" caused increased urinary excretion of EP which could be suppressed by methamphetamine and pentobarbital. It appears that "urinary excretion of adrenaline provides a sensitive measure of reactions to mental stress, and that centrally acting drugs may influence adrenaline excretion during mental work."

Levi, L.: "The urinary output of adrenalin and noradrenalin during experimentally induced emotional stress in clinically different groups. A preliminary report." *Acta Psychother. (Basel)* 11: 218-227 (1963).

E37,966/63

Healthy young soldiers were exposed to "industrial stress" simulating actual working conditions in a factory or workshop, or to "film stress" (viewing scenes of cruelty, violence and military surgery). Both caused increased catecholamine excretion.

Euler, U. S. von: "Adrenergic neurohormones." In: Euler, U.S. von and Heller, H., *Comparative Endocrinology. II. Tissue Hormones*, pp. 209-238. New York and London: Academic Press, 1963. E4,175/63

Review on catecholamines, with special reference to their distribution in the tissues of various species, biosynthesis, storage, release and excretion. The effect of stressors and of drugs specifically affecting the release of adrenergic transmitters is only briefly considered.

Marchbanks, V. H. Jr., Hale, H. B., Ellis, J. P. Jr.: "Stress responses of pilots flying 6-hour overwater missions in F-100 and F-104 aircraft." *Aerosp. Med.* 34: 15-18 (1963). G2,360/63

In navy pilots flying six-hour overwater missions in F-100 and F-104 aircraft, corticoid levels were increased in the plasma but not in the urine. Urinary EP and NEP values were considerably above normal as were the excretion rates of urea and uric acid, while phosphate levels were not altered. The total reaction depended very much upon airplane characteristics and pilot experience.

Weiner, N.: "The catecholamines: biosynthesis, storage and release, metabolism and metabolic effects." In: Pincus, G., Thimann, K. V. et al., *The Hormones. Physiology, Chemistry and Applications*, Vol. 4, pp. 403-479. New York and London: Academic Press, 1964. E4,436/64

Review on the catecholamines in the adrenal medulla, brain and other peripheral tissues, their biosynthesis, storage and release under normal conditions and after treatment with various agents (500 refs.).

Euler, U. S. von: "Quantitation of stress by catecholamine analysis." *Clin. Pharmacol. Ther.* 5: 398-404 (1964). G18,238/64

Review of the literature and personal observations on man suggest that "gravitational stress and exposure to cold are mainly associated with an increase in the norepinephrine excretion, indicating the importance of this hormone in circulatory and temperature-controlling homeostatic mechanisms. Mental stress involving exhilarating or aggressive reactions is also associated with an increase in the norepinephrine excretion. The types of emotional stress which are mainly characterized by apprehension, anxiety, pain, or general discomfort are regularly accompanied by an increase in the epinephrine excretion." Special sections are devoted to the catecholamine discharge associated with flying, mental work and exposure to cold.

Schmid, E., Meythaler, C.: "Untersuchungen über die sympathico-adrenale Reaktion bei Autofahrern mit Hilfe der Vanillinmandelsäure-Bestimmung im Harn" (Examination of the sympathetic-adrenal reaction in drivers. Urinary vanillylmandelic acid excretion). *Klin. Wochenschr.* 42: 139-140 (1964). F2,669/64

In city drivers and even in their passengers, VMA excretion increases considerably, imply-

ing raised catecholamine production during stress.

Frankenhaeuser, M., Patkai, P.: "Catecholamine excretion and performance during stress." *Percept. Mot. Skills* **19**: 13-14 (1964). F45,033/64

In college students exposed to various stressors, "the amount of noradrenaline excreted was positively correlated with improvement in performance during stress."

Frankenhaeuser, M., Pátka, P.: "Interindividual differences in catecholamine excretion during stress." *Scand. J. Psychol.* **6**: 117-123 (1965). F72,211/65

Gillis, C. N.: "Altered cardiac retention of exogenous noradrenaline produced by stress in young rabbits." *Nature* **207**: 1302-1304 (1965). F50,830/65

The retention of radio-marked NEP during stress is inhibited by ACTH or cortisol in the rabbit heart.

D'Amelio, G., Marchiori, C., Busonera, G., Celon, E.: "Modificazioni della eliminazione urinaria delle catecolamine dei 17-idrossicorticoidi e dei 17-chetosteroidi, nello stress da stimolazione vestibolare" (Changes in urinary elimination of catecholamines, 17-hydroxycorticosteroids and 17-ketosteroids in stress caused by vestibular stimulation). *Endocrinol. Sci. Cost.* **29**: 57-63 (1966). J24,555/66

Zubek, J. P., Schutte, W.: "Urinary excretion of adrenaline and noradrenaline during prolonged perceptual deprivation." *J. Abnorm. Psychol.* **71**: 328-334 (1966). J24,049/66

In young men who successfully completed a week of perceptual isolation, there was no significant change in urinary EP or NEP excretion. However "quitters" had a significantly lower baseline of EP even months after the isolation experiment, but exhibited an increased excretion during isolation. "These results seem to suggest that isolation quitters may be biochemically or 'constitutionally' different from volunteers who can successfully complete a prolonged period of perceptual isolation."

Schmid, E.: "Untersuchungen über Physiologie und Pathophysiologie des sympathikos-

adrenalen Systems durch Bestimmung der Vanillin-Mandelsäure-Ausscheidung im Harn mit dünnenschichtchromatographischer Technik" (Studies on the physiology and physiopathology of the sympathico-adrenal system by determination of vanillylmandelic acid excretion in the urine by thin-layer chromatography). *Arch. Kreislaufforsch.* **49**: 83-116 (1966). F62,295/66

Clinical observations suggest that "emotional and bodily stress increases the turnover of catecholamines and the urinary excretion of vanilmandelic acid in healthy persons."

Peterfy, G., Pinter, E. J., Cleghorn, J. M., Pattee, C. J.: "Observations on the adrenergic mechanism of hyperadiopinesis of emotional stress." *Proc. Can. Fed. Biol. Soc.* **9**: 64 (1966). F66,182/66

In men and women the emotional stress of threatening suggestions leads to hyperadiopinesis. "The primary factor appears to be the adrenergic nervous system." This response, associated with marked increases in plasma FFA and catecholamine levels, is prevented by a β -adrenergic blocking agent (propranolol).

Glowinski, J., Baldessarini, R. J.: "Metabolism of norepinephrine in the central nervous system." *Pharmacol. Rev.* **18**: 1201-1238 (1966). F74,390/66

Review on the role of NEP in CNS activity, with a brief section on the effect of stress upon brain NEP.

Goldstein, M., Nakajima, K.: "The effect of disulfiram on the biosynthesis of catecholamines during exposure of rats to cold." *Life Sci.* **5**: 175-179 (1966). G36,828/66

In rats, enhanced catecholamine excretion during exposure to cold suggests increased activity of the sympatho-adrenal system. Disulfiram, a potent inhibitor of dopamine- β -hydroxylase, causes only a slight decrease in the cardiac NEP concentration of adrenalectomized rats at room temperature, but the levels in animals kept at 2°C for one hour show a .50 percent drop as compared with NEP values in the corresponding controls. The fact that cold decreases the cardiac NEP content following inhibition of dopamine- β -hydroxylase by disulfiram "suggests an increase in cardiac norepinephrine utilization during cold exposure." In otherwise untreated animals the cardiac NEP levels after cold exposure are sustained by an increase in the biosynthesis of these catecholamines. Pos-

sibly, the increase in NEP biosynthesis during cold is due to excess dopamine formation.

Rosecrans, J. A., Watzman, N., Buckley, J. P.: "The production of hypertension in male albino rats subjected to experimental stress." *Biochem. Pharmacol.* **15**: 1707-1718 (1966). G42,049/66

In rats subjected "to a chronic variable stress program consisting of flashing lights, audiogenic stimulation, and oscillation," hypertension developed after several months. This was associated with an increase in catecholamine excretion which disappeared after several weeks, and a rise in plasma corticosterone which tended to persist. "These results suggest that the adrenal glands had become more efficient in the rate of synthesis and release of steroids after chronic exposure to the stressors."

Balestra, V., Buonvino, M., Canepa, R.: "Sulla valutazione statistica ed epidemiologica degli stress psico-fisici. Ricerche effettuate mediante il dosaggio dell'acido vanilmandelico nell'urina e mediante questionari" (On the statistical and epidemiologic evaluation of psycho-physical stress. Research based on determinations of urinary vanilmandelic acid and on questionnaires). *G. It. Med. Prev.* **8**: 139-166 (1967).

J22,349/67

Extensive review and personal observations indicating that VMA excretion has only moderate value in determining psychogenic or somatic stress which may predispose to CHD (21 refs.).

Ehrentheil, O. F., Reyna, L. J., Adams, C. J., Giovanniello, T. J., Chen, E. T.: "Studies in stress glycosuria. II. Glycosuria and blood sugar elevation in alloxanized sub-diabetic white rats subjected to electric shock stress." *Diabetes* **16**: 319-324 (1967).

F81,456/67

Chang, C. C., Su, C. Y.: "Effect of cold stress on the subcellular distribution of noradrenaline in the rat heart." *J. Pharm. Pharmacol.* **19**: 73-77 (1967). G44,503/67

Stabrowskii, E. M.: "The distribution of adrenaline and noradrenaline in the organs of the baltic lamprey *Lampetra fluviatilis* at rest and under various functional stresses." *Zh. Evol. Biokhim. Fiziol.* **3** No. 3: 216-221 (1967). J11,822/67

In the lamprey, chromaffin cells containing EP and NEP are found in various organs, particularly the heart. The stress of hypoxia

diminishes the EP content in the heart, skeletal muscle and liver, whereas the NEP increases in liver tissue. "It is suggested that the chromaffin tissue of the lamprey heart acts as the medulla of mammalian suprarenals."

Euler, U. S. von: "Adrenal medullary secretion and its neural control." In: Martini, L. and Ganong, W. F., *Neuroendocrinology*, Vol. 2, pp. 283-333. New York and London: Academic Press, 1967. E6,914/67

An extensive chapter on the neural control of adrenal medullary secretion within a treatise on neuroendocrinology in general. Special attention is given to comparing the ability of various stressors to stimulate EP secretion, as summarized in the following table:

Epinephrine excretion in urine during various kinds of stress

Situation	Epinephrine (nanograms per minute)
Normal, resting	4-8 ¹
Mental work	11-15 ²
Examinations	6.5-21 ³
Routine work under stressful conditions (industrial stress)	18 ⁴
Exciting films	11 ⁵
Air transportation	24 ⁶
Centrifugation mock run	31 ⁷
Centrifugation first run	38 ⁸
Centrifugation sixth run	9 ⁸
Suborbital space flight	
Preflight 4 days	25
Postflight 30 minutes	33 ⁹
Postflight 45 hours	6
Parachute jumping	18 ¹⁰

Adapted, by permission, from L. Martini and W. F. Ganong, *Neuroendocrinology*, Vol. 2. New York and London: Academic Press, 1967.

The effects of numerous other stressors (cold, heat, hypoxia, hemorrhage, physical and emotional exertion, hypo- and hypergly-

cemia and so on) are separately discussed (several hundred refs.).

Roessler, R., Burch, N. R., Mefferd, R. B.: "Personality correlates of catecholamine excretion under stress." *J. Psychosom. Res.* **11**: 181-185 (1967). G49,965/67

Male students with low and high scores of ego strength (as determined by the MMPI) were compared regarding their catecholamine excretion upon exposure to different intensities of sound and light. In high ego strength subjects, catecholamine excretion was increased, whereas it was decreased in the other group.

Levi, L.: "Sympatho-adrenomedullary responses to emotional stimuli: methodologic, physiologic and pathologic considerations." In: Bajusz, E., *An Introduction to Clinical Neuroendocrinology*, p. 78. Basel and New York: S. Karger, 1967. E6,577/67

Brief review of personal observations and literature on the influence of everyday stressors upon catecholamine production.

Franzen, F., Friedrich, G., Gross, H.: "Normabweichendes Auftreten proteinogener Amine bei Verbrennungskranken" (Abnormal activities of proteinogenic amines in burned patients). *Z. Gesamte. Inn. Med.* **22**: 401-404 (1967). F87,778/67

In severely burned patients, the plasma and urinary concentrations of EP, NEP, 5-HT, histamine and other amines derived from protein decomposition are greatly increased. No evidence is given that these changes are due to stress rather than to the specific effect of burns.

Levi, L.: "Sympatho-adrenomedullary activity, diuresis, and emotional reactions during visual sexual stimulation in females and males." *Lab. Clin. Stress Res.* (Stockh.) Rep. No. 3: 1-33 (1968). G63,782/68

The viewing of films causing sexual arousal elicited more pronounced EP and NEP excretion in male than in female students. This difference paralleled self-rating scores in emotional reactions.

Taggart, P., Gibbons, D., Somerville, W.: "Some effects of motor-car driving on the normal and abnormal heart." *Br. Med. J.* October 18, 1969, pp. 130-134. H18,098/69

"Little or no change in the plasma catecholamine levels was noted in three coronary subjects immediately after a city drive compared with resting levels. All the racing drivers showed a considerable increase in

noradrenaline, and in one instance adrenaline, immediately after racing."

McDonald, L., Baker, C., Bray, C., McDonald, A.: "Plasma-catecholamines after cardiac infarction." *Lancet* November 15, 1969, pp. 1021-1023. H18,916/69

In racing drivers, plasma NEP levels were greatly raised immediately after the race. Following cardiac infarction, "patients with atrial dysrhythmias or early ventricular dysrhythmias had higher noradrenaline concentrations in their plasma. There was no such difference for patients with late ventricular dysrhythmias, and adrenaline levels were unremarkable. The raised noradrenaline levels are not thought to be related to stress because six other patients undergoing the stressful procedure of cardiac catheterisation had low levels."

Sharma, V. N., Godhwani, J. L.: "Stress-induced changes in catecholamine, glycogen and blood glucose levels and their modification by antiadrenergic drugs." *Indian J. Med. Res.* **58**: 1063-1072 (1970). G82,559/70

Frankenhaeuser, M., Rissler, A.: "Effects of punishment on catecholamine release and efficiency of performance." *Psychopharmacologia* **17**: 378-390 (1970). G77,863/70

Male university students were asked to accomplish a choice-reaction task, and some received electric shocks either at random or as punishment for slow performance. Others were not punished irrespective of performance. "Punishment produced a rise in both adrenaline and noradrenaline release. By increasing the subject's control over the situation it was possible to counteract the adrenaline increase, while noradrenaline release appeared unaffected. On the whole, subjects with high as compared with low rates of adrenaline and noradrenaline excretion were more efficient in terms of both speed and accuracy of performance."

Kvetňanský, R., Weise, V. K., Gewirtz, G. P., Kopin, I. J.: "Synthesis of adrenal catecholamines in rats during and after immobilization stress." *Endocrinology* **89**: 46-49 (1971). H43,006/71

Immobilization is known to augment tyrosine hydroxylase in rat adrenals. It could now be shown that "the increased levels of enzymes result in enhanced synthesis of epinephrine-¹⁴C from tyrosine-¹⁴C but not from dopa-³H. During immobilization, conversion of tyrosine-¹⁴C to catecholamines is further increased and may exceed the capacity of

even the elevated levels of dopamine- β -hydroxylase to convert dopamine to norepinephrine."

Konczett, H., Hörtnagl, H., Hörtnagl, H., Winkler, H.: "On the urinary output of vasopressin, epinephrine and norepinephrine during different stress situations." *Psychopharmacologia* (Berlin) **21**: 247-256 (1971).
J20,330/71

Shum, A., Johnson, G. E., Flattery, K. V.: "Catecholamine and metabolite excretion in cold-stressed immunosympathectomized rats." *Am. J. Physiol.* **221**: 64-68 (1971).

H41,823/71

Immunosympathectomy did not prevent the increase in NEP secretion produced in the rat by exposure to cold. However, when compared with untreated littermates, the immunosympathectomized rats excreted slightly less NEP and normetanephrine, and considerably less 3-methoxy-4-hydroxyphenylethylene glycol (MHPG). "It is postulated that a decreased sympathetic reserve in these animals caused a higher percentage of norepinephrine synthesized to be secreted as such, causing the lower MHPG excretion."

G81,581/71

Extensive review on the G.A.S. with special emphasis on the sympathetic system and adrenergic responses to various stressors (46 refs.).

Taggart, P., Carruthers, M.: "Endogenous hyperlipidaemia induced by emotional stress of racing driving." *Lancet* February 20, 1971, pp. 363-366.
H35,851/71

During racing driving, "the total-catecholamine levels were grossly elevated, the increase being largely due to noradrenaline. The free-fatty-acid levels were also elevated one to three minutes before the start while the drivers were on the starting grid, and up to one hour after the race. The triglyceride levels were slightly elevated after the event, continued to increase, and reached a

peak at one hour." The blood cholesterol level showed no significant changes.

Frankenhaeuser, M., Nordheden, B., Myrsten, A. L., Post, B.: "Psychophysiological reactions to understimulation and overstimulation." *Acta Psychol. (Amst.)* **35**: 298-308 (1971).
G99,743/71

In student policemen subjected to understimulation (vigilance test) and overstimulation (complex sensorimotor test), NEP releases were increased in comparison to their levels during the control condition with a medium amount of stimulation. Subjects excreting relatively more EP performed better during understimulation, whereas those excreting small amounts of EP performed more efficiently during overstimulation.

Lamke, L. O., Lennquist, S., Liljedahl, S. O., Wedin, B.: "The influence of cold stress on catecholamine excretion and oxygen uptake of normal persons." *Scand. J. Clin. Lab. Invest.* **30**: 57-62 (1972).
H61,015/72

In young men, exposure to cold greatly increased urinary excretion of EP and NEP with a concurrent rise in oxygen uptake. "This indicates that the catecholamines play an important part in the regulation of the heat balance."

Hartley, L. H., Mason, J. W., Hogan, R. P., Jones, L. G., Kotchen, T. A., Mougey, E. H., Wherry, F. E., Pennington, L. L., Ricketts, P. T.: "Multiple hormonal responses to graded exercise in relation to physical training." *J. Appl. Physiol.* **33**: 602-606 (1972).
H79,757/72

In man the stress of heavy bicycle exercise increased plasma STH, cortisol and EP values, but decreased insulin concentration.

J19,599/72

Data on patients under extreme stress following myocardial infarction or major surgical interventions. 1. Growth hormone release is not readily suppressible by glucose in the stress situation studied. 2. Circulating catecholamines are probably not primarily involved in releasing excess growth hormone, as insulin release is more frequently elevated at the same time. 3. The paradoxical rise in glucose which can occur in extreme stress, appears to be a reversion to a primitive pattern of growth hormone secretion which is observed in the newborn infant. 4. The effect

of glucose in adequately suppressing A.C.T.H. while producing statistically insignificant suppression of growth hormone releases, suggests either that the A.C.T.H. secreting cell is more sensitive to the direct effect of glucose, or that extra-pituitary factors, either neuronal or hormonal, may be of more significance in controlling growth hormone release."

J10,479/73

Brief monograph on the value of catecholamine excretion as an indicator of psychogenic stress responses.

Halawani, M. E. el, Waibel, P. E., Appel, J. R., Good, A. L.: "Effects of temperature stress on catecholamines and corticosterone of male turkeys." *Am. J. Physiol.* **224**: 384-388 (1973). H65,841/73

In male turkeys, neither heat nor stress had any pronounced effect upon adrenal, brain or heart catecholamine concentrations; however, plasma corticosterone levels rose. When α -MT (an inhibitor of catecholamine synthesis) was given prior to stress exposure,

catecholamine concentrations fell markedly unless the birds had been previously adapted in hot or cold environments. "These findings indicate that an increased rate of catecholamine and corticosterone release seems to be required during the initial response to temperature stress, and may be associated with the adaptive changes leading to temperature acclimation" (20 refs.).

Neil-Dwyer, G., Cruickshank, J., Stott, A., Brice, J.: "The urinary catecholamine and plasma cortisol levels in patients with subarachnoid haemorrhage." *J. Neurol. Sci.* **22**: 375-382 (1974). J13,673/74

Normetanephrine and metanephrine are urinary metabolites of NEP and EP, respectively. In patients with subarachnoid hemorrhages, urinary excretion of these compounds and the plasma cortisol levels remain increased for fourteen days, after other evidence of stress has subsided.

Ortiz, G. A., Argüelles, A. E., Crespin, H. A., Sposari, G., Villafañe, C. T.: "Modifications of epinephrine, norepinephrine, blood lipid fractions and the cardiovascular system produced by noise in an industrial medium." *Horm. Res.* **5**: 57-64 (1974).

H81,167/74

In aircraft factory workers exposed to turbine noise for three hours, there was generally a marked elevation of catecholamine excretion as well as of blood cholesterol levels, FFA values, blood pressure and pulse frequency. Unexpectedly, the plasma corticoid concentrations were slightly subnormal, but this may have been due to circadian variations.

Zachariasen, R. D., Newcomer, W. S.: "Phenylethanolamine-N-methyl transferase activity in the avian adrenal following immobilization or adrenocorticotropin." *Gen. Comp. Endocrinol.* **23**: 193-198 (1974).

H88,608/74

In cockerels, ACTH and immobilization resulted in an increase in plasma EP and NEP with an accompanying decrease in the adrenal levels of these catecholamines; plasma corticosterone rose, as did the phenylethanolamine-N-methyl transferase (PNMT) content of the adrenals, without affecting adrenal corticosterone. "It is suggested that the rapid increase in PNMT activity, occurring with the acute application of stressors in chickens, may provide a means of sustaining an increased outflow of EP in times of 'stress'." Corticosterone may play a role in

the elevation of PNMT during the avian stress response.

J22,333/74

Among ATCs, catecholamine excretion is greatest at airports with the heaviest traffic.

Ancona, L., Capoleoni, M.: "L'aggressione giustificata e non giustificata attraverso il dosaggio catecolaminico" (Justified and unjustified aggression through dosage of catecholamines). *Totus Homo* **5**: 17-26 (1974).

H97,091/74

In man, "stress produced by a stimulus set on film representing a sadistic scene induces diverse biochemical and psychodynamic reactions depending on whether the subject thinks that the stressing action seen by him is justified or not. When the subject watches an action that he judges socially and normally deplorable, the ratio of noradrenaline/adrenaline excreted in the urine varies in favor of the adrenaline and there is a significant increase in the projected aggressiveness."

Friedman, M., Byers, S. O., Diamant, J., Rosenman, R. H.: "Plasma catecholamine response of coronary-prone subjects (Type A) to a specific challenge." *Metabolism* **24**: 205-210 (1975).

H98,918/75

In a nonphysical competitive struggle (puzzle solving), the plasma NEP content of Type-A persons rises 30 percent above that of Type-B individuals, whereas plasma EP remains essentially unchanged in both groups.

Brooks, Ch. McC., Koizumi, K., Pinkston, J. O. (eds.): "The Life and Contributions of Walter Bradford Cannon 1871-1945." *Papers at a Centennial Symposium at State University of New York Downstate Medical Center 1972*, p. 264. New York: SUNY Downstate Medical Center, 1975.

E10,898/75

Symposium in which all surviving students and associates of W. B. Cannon have summarized his major contributions, especially regarding the understanding of homeostasis in relation to catecholamine secretion, as well as the manner in which their own work was stimulated by this great master of physiology. Contains articles by H. W. Davenport, J. Farman, Ch. McC. Brooks, Z. M. Bacq, H. Selye, K. Lissák, Ph. Bard and R. Gerard.

Corticotropin Releasing Factor (CRF)

The role of CRF in the mediation of stress responses from the hypothalamus to the pituitary will be discussed in the section, Theories.

Here, let us merely point out that in hypophysectomized, unlike in intact rats, CRF could be demonstrated in the peripheral blood, even after adrenalectomy or treatment with large doses of cortisol, but not after appropriate hypothalamic lesions. It was concluded that CRF is a specific hypothalamic neurohumor regulating ACTH discharge.

However, even under conditions of maximal secretion, CRF is too labile to be demonstrable in the peripheral blood, except during a short period after its release.

For abstracts relating to this section, see CRF under Theories (Nervous Mechanisms).

5-HT (5-Hydroxytryptamine or Serotonin) and Related Compounds

In man, the corticoid and indole excretion patterns showed similar circadian variations and rises after exposure to ACTH or stressors.

Sleep deprivation and other stressful experiences, like ACTH, result in the appearance of a "stress-responsive indole substance" (SRIS) in the urine of man. The physicochemical characteristics of this material were carefully described but it could not be definitely identified. It may be related to 5-HT.

Among white-collar workers, excretion of 5-HIAA, corticoids and catecholamines was increased during work days as compared to weekends, but excessive individual variations make interpretation of these data difficult.

In various species of animals travelling on satellite spaceships, exposure to ionizing rays, acceleration and vibration considerably diminished the blood 5-HT content.

The bulk of the literature on 5-HT metabolism will be found in Chapter V, Theories, as it relates to neurohumoral mechanisms within the CNS during stress.

5-HT and Related Compounds

(See also our earlier stress monographs, p. xiii, as well as 5-HT under Other Hormones and Hormone-like Substances in the section on Hormonal Mechanisms, and cf. EP and NEP in abstracts, where these catecholamines are mentioned, for comparison with 5-HT)

Blackman, J. G., Campion, D. S., Fastier, F. N.: "Mechanism of action of reserpine in producing gastric haemorrhage and erosion in the mouse." *Br. J. Pharmacol.* **14**: 112-116 (1959).

C68,958/59

In mice, gastric hemorrhage and erosion are produced by reserpine through a mechanism involving liberation of 5-HT.

Mandell, A. J., Slater, G. G., Mersol, I.: "An indole stress reactant. A preliminary report." *Arch. Gen. Psychiatry* **5**: 42-44 (1961). E56,435/61

Indole and 17-OHCS excretion varied simultaneously in patients under stress or after injection of ACTH. The indole discharge (and its possible relationship to 5-HT) could not be clarified; yet it was concluded "that this indole might serve as another interesting

dependent variable in studies of stress and stress diseases."

Sharma, V. N., Khanna, N. K.: "Effect of cold stress on acetylcholine and 5-HT contents of rat myocardium and its modification by eserine, mecamylamine and reserpine." *Indian J. Med. Res.* **57**: 1563-1572 (1969). G71,369/69

Markiewicz, L., Jankowski, K., Grzesiuk, L., Szadkowski, S.: "Excretion of catecholamines, corticosteroids and 5-HIAA as related to the testing conditions, physical fitness and psychological variables of healthy subjects." *Acta Med. Pol.* **14**: 51-68 (1973). J3,838/73

Among white-collar workers living in Warsaw, excretion of 5-HIAA, corticoids and catecholamines was higher during work days than on weekends, although individual variations were very wide.

Chernukh, A. M., Gorizontova, M. P., Alexeyev, O. V.: "The mechanism of participation of the mast cells in regulation of the vascular permeability." *Biochem. Exp. Biol.* **11**: 105-110 (1974). H96,177/74

In rats, restraint causes degranulation of mast cells with liberation of histamine, 5-HT and heparin. These substances may have a role in the mechanism of vascular reactions during stress.

Vaccari, A., Maura, G.: "Effects of chronic environmental stress on 5-hydroxytryptamine receptors in smooth muscle of rats." *Environ. Physiol. Biochem.* **4**: 259-262 (1974). J22,265/74

Histamine

Even in our first publications on the alarm reaction, we expressed the suspicion that liberation of some histamine-like substance may act as the "first mediator." However, this hypothesis still cannot be adequately proven.

It has been shown that, in severely burned patients, blood and urinary histamine, EP, NEP and corticoid excretion products are concurrently increased during the first twenty-four hours. However, their role in the pathogenesis of burn shock cannot be defined exactly.

In rats depleted of histamine by compound 48/80, adrenal ascorbic acid discharge by stressors (formalin, cold) or chlorpromazine is significantly suppressed. Such pre-treatment also significantly blocked adrenal ascorbic acid depletion and plasma corticosterone elevation, but did not change the effect of exogenous histamine. Under various other circumstances, the plasma corticosterone rise and adrenal ascorbic acid loss were also frequently dissociated. Hence, histamine release may play some role in the mediation of adrenal ascorbic acid depletion during stress, but there is no strict correlation between this change and the elevation of plasma corticosterone.

In rats and guinea pigs kept on vitamin C-deficient diets, a great variety of stressors increased histamine formation and urinary excretion. This effect could be inhibited by large doses of exogenous vitamin C, allegedly suggesting endogenous detoxication of histamine by ascorbic acid.

In rats, cold markedly reduced brain histamine but augmented its formation in the hypothalamus. Furthermore, the ME is conspicuously rich in histamine, a fact that raised a question as to "whether histamine is an active stimulant of pituitary secretion." However, in rats pretreated with phenergan and exposed to a great variety of stressors, only histamine became incapable of causing adrenal ascorbic acid discharge, which suggested that it cannot be the only humoral agent responsible for ACTH secretion during stress. Yet histidine decarboxylase is considered to be an adaptive enzyme, because its activity increases in various tissues under the influence of stressors, and even if it is not the only first mediator of ACTH discharge, it may act as one of the first mediators transmitting the stress message from directly damaged tissues throughout the organism, even after hypophysectomy.

Histamine

(See also our earlier stress monographs, p. xiii, and cf. Histamine under Other Hormones and Hormone-like Substances in the section on Hormonal Mechanisms)

Selye, H.: "A syndrome produced by diverse nocuous agents." *Nature* **138**: 32 (1936). 36,031/36

Brief letter to the editor describing the most characteristic signs of what is now known as the stress syndrome, particularly the thymicolymphatic involution, gastroduodenal ulcers, lipid discharge from the adrenal cortex and loss of chromaffinity in the medulla. The three stages are discussed. "We consider the first stage to be the expression

of a general alarm of the organism when suddenly confronted with a critical situation, and therefore term it the 'general alarm reaction.' Since the syndrome as a whole seems to represent a generalised effort of the organism to adapt itself to new conditions, it might be termed the 'general adaptation syndrome'." The reaction is regarded as a non-specific adaptive response to various kinds of agents and in view of its stereotypical appearance is ascribed to the liberation of some common initiating substance, possibly histamine.

Selye, H.: "Further evidence in support of the alarm reaction theory of adrenal insufficiency." *Am. J. Physiol.* **119**: 400-401 (1937). 68,414/37

Brief description of observations which "lead us to assume that the liberation from the tissues of certain toxic metabolites with histamine-like pharmacological effects is the primary cause both of the alarm reaction and of adrenal insufficiency."

Selye, H.: "Experimental production and prevention of appendicitis with histamine." *Can. Med. Assoc. J.* **36**: 462-464 (1937).

68,819/37

In certain strains of rats, intravenous injection of histamine causes acute phlegmonous appendicitis which may be prevented by pretreatment with smaller doses of the same substance. Other stressors may also produce similar appendicular lesions.

Tepperman, J., Rakieten, N., Birnie, J. H., Diermeier, H. F.: "Effect of antihistamine drugs on the adrenal cortical response to histamine and to stress." *J. Pharmacol. Exp. Ther.* **101**: 144-152 (1951). B59,242/51

In rats, various antihistamines (Phenoxyadrine, Benadryl, Pyribenzamine) did not significantly alter the adrenal ascorbic acid concentration, but intraperitoneal injection of histamine reduced it remarkably. On the other hand, "pretreatment with an antihistamine drug did not prevent or modify the adrenal ascorbic acid response to the stress of intraperitoneal carbon tetrachloride administration."

Harris, G. W., Jacobsohn, D., Kahlson, G.: "The occurrence of histamine in cerebral regions related to the hypophysis." In: Wolstenholme, G. E. W., *Ciba Foundation. Colloquia on Endocrinology*, Vol. 4, pp. 186-193. London: J and A Churchill, 1952.

B76,078/52

In rats, "the median eminence is conspicuously rich in histamine." It remains to be shown whether histamine is an active stimulant of pituitary secretion.

Guillemin, R., Fortier, C.: "Role of histamine in the hypothalamo-hypophyseal response to stress." *Trans. N.Y. Acad. Sci.* **15**: 138-140 (1953). B80,534/53

In rats pretreated with Phenergan and exposed to various "neurotropic" (sound, restraint) and "systemic" (cold, histamine) stressors, only histamine became incapable of causing adrenal ascorbic acid discharge. "These results do not support the view that histamine may be an important factor and, in no way, an indispensable link in hypothalamo-pituitary alteration due to neurotropic stress." They also show that histamine

cannot be the only humoral agent responsible for pituitary stimulation during stress.

Nasmyth, P. A.: "Histamine release and the 'stress phenomenon.'" *Br. J. Pharmacol.* **10**: 51-55 (1955). C4,608/55

From experiments in rats, "it is concluded that released histamine plays some part in the effect of 48/80 on the adrenal cortex."

Birke, G., Dunér, H., Liljedahl, S. O., Persnow, B., Plantin, L. O., Troell, L.: "Histamine, catechol amines and adrenocortical steroids in burns." *Acta Chir. Scand.* **114**: 87-98 (1958). J10,862/58

In severely burned patients, blood and urinary histamine, as well as the excretion of EP, NEP and corticoids (17-KGS) were considerably increased during the first twenty-four hours, but the duration of the rise varied according to the substances examined. Their role in the genesis of burn shock is discussed.

Schayer, R. W.: "Relationship of stress-induced histidine decarboxylase to circulatory homeostasis and shock." *Science* **131**: 226-227 (1960). C79,680/60

Histidine decarboxylase is considered to be an adaptive enzyme. Its activity in various tissues of the mouse increases under the influence of stressors (burns, delayed allergy, vaccines, cold, bacterial toxins and so on) and EP. Histamine may be a shock toxin or mediator of the stress reaction.

Schayer, R. W.: "Evidence that induced histamine is an intrinsic regulator of the microcirculatory system." *Am. J. Physiol.* **202**: 66-72 (1962). D17,063/62

In various species, "such diverse stimuli as increased room temperature, infection and injection of reticuloendothelial system activators elicit changes in histidine decarboxylase activity consistent with microcirculatory homeostasis." The fact that augmented amounts of glucocorticoids are needed during inflammation is "compatible with the existence of a vasodilator substance associated with small blood vessels, which may be produced at an increased rate either locally or systemically."

Schayer, R. W.: "Role of induced histamine in tourniquet shock in mice." *Am. J. Physiol.* **203**: 412-416 (1962). D32,955/62

Observations on mice traumatized with a tourniquet "suggest that the fundamental process leading to shock after fluid loss is activation of histamine synthesis in or near

cells of the capillaries to restore an adequate supply of blood to the tissues. Since induced histamine synthesis is controlled by local conditions, opening of the capillary beds proceeds independently of the over-all circulatory picture; finally, homeostasis can no longer be maintained."

Thayer, W. R., Toffler, A. H., Chapo, G., Spiro, H. M.: "Inhibition of restraint ulcers in the rat by pyridoxine deficiency." *Yale J. Biol. Med.* **38**: 257-264 (1965).

G37,375/65

In rats, pyridoxine deficiency decreases the incidence of restraint ulcers and depresses gastric secretion. "It is suggested that since pyridoxine deficiency lowers histamine-forming capacity, this reduction in endogenous histamine leads to a decrease in acid production which then protects against restraint ulcers.... Selye has shown that prior restraint markedly diminishes an animal's general response to a histamine liberator, 48-80. Selye suggested that this was the result of protection by endogenous corticoids, but an alternative explanation suggested by the present experiments is that restraint so exhausted the histamine stores that there could be no further response to a histamine liberator."

Garden, J. W.: "Plasma and sweat histamine concentrations after heat exposure and physical exercise." *J. Appl. Physiol.* **21**: 631-635 (1966).

F73,240/66

Bousquet, W. F., Miya, T. S., Sanchez, C.: "Modification of stress responses in histamine-depleted rats." *Br. J. Pharmacol.* **27**: 177-184 (1966).

G40,225/66

In rats, depletion of histamine by compound 48/80 significantly inhibited adrenal ascorbic acid diminution by formaldehyde, cold or chlorpromazine. Such pretreatment also blocked adrenal ascorbic acid depletion and plasma corticosterone elevation by compound 48/80, but did not affect that caused by exogenous histamine. Under various other circumstances, adrenal ascorbic acid depletion and plasma corticosterone elevation were also often dissociated. Histamine release may be of significance in mediating the ascorbic acid depletion produced by stressors, but there is no strict correlation between plasma corticosterone and adrenal ascorbic acid levels during stress. "The measurement of stress by a single parameter is thus not an absolute indication that a complete re-

sponse to stimulation of the pituitary-adrenal axis has taken place."

Filipp, G.: *Pathogenese und Therapie allergischer Reaktionen. Grundlagenforschung und Klinik* (Pathogenesis and therapy of allergic reactions. Theory and practice), p. 767. Stuttgart: Ferdinand Enke Verlag, 1966.

E6,824/66

Monograph on the pathogenesis of allergic reactions, with several sections on the G.A.S. Stress influences the immune system in various ways, since activation of the hypothalamus-pituitary-adrenocortical axis mobilizes corticoids and catecholamines, causes involution of the thymic lymphatic apparatus and brings about "anamnestic reactions" which reactivate preexistent immune responses. Furthermore, histamine metabolism is largely dependent upon the above-mentioned stress hormones; and cortisone as well as catecholamines have long been known to affect allergies of various kinds. Presumably, the so-called "nonspecific irritation therapy" (injection of foreign proteins, bacterial polysaccharides and so on) also plays a role in this respect.

In rats, cold markedly reduced brain histamine levels but augmented its formation in the hypothalamus.

Makarov, I. A.: "Role of histaminemia in changes of the eosinophil count during stress." *Vrach. Delo* No. 1: 77-79 (1971) (Russian).

J19,053/71

Observations on the rat and man suggest that "histamin may be the cause of eosinopenia and eosinophilia. Local histaminemia is accompanied by eosinopenia, total by eosinophilia. It is concluded that poststress eosinopenia develops due to prevailing migration of eosinophils into tissues with an increased histamin content as compared with their mobilization from the bone marrow. Blocking of endogenous histamin leads only to mobilization of cells from the bone marrow causing [the] paradoxical character of the reaction."

Makarov, I. A.: "Role of the adrenals in the development of post-stress eosinopenia." *Ter. Arkh.* **44** No. 11: 53-58 (1972) (Russian)

H91,719/72

There is no evidence of a direct destruction of blood eosinophils by glucocorticoids. Observations in rats and patients suggest that stress eosinopenia is produced by "local freeing of endogenic histamin in a number of organs. Glucocorticoids play the auxiliary role of a creator of an appropriate gradient of histamin concentration in the blood and tissues causing migration of eosinophils in the tissue. This confirmed the fact of blocking eosinopenia by dimedrol premedication. A regular drop in the markedness of eosinopenia observed in stress in patients with considerable hypercorticism can be attributed to the increase of the level of natural antagonist of

histamin-heparin in patients of such kind."

Seidel, W., Lorenz, W., Doenicke, A., Mann, G., Uhlig, R., Rohde, H.: "Histamin-freisetzung beim Menschen und Stressulkus-Pathogenese" (Histamine liberation in man and the pathogenesis of stress ulcers). *Z. Gastroenterol.* **11**: 297-300 (1973).

J24,571/73

In man, the plasma histamine content rises under the influence of various stressors and may play an important role in the pathogenesis of stress ulcers.

Chernukh, A. M., Gorizontova, M. P., Alexeyev, O. V.: "The mechanism of participation of the mast cells in regulation of the vascular permeability." *Biochem. Exp. Biol.* **11**: 105-110 (1974).

H96,177/74

In rats, restraint causes degranulation of mast cells with liberation of histamine, 5-HT and heparin. These substances may have a role in the mechanism of vascular reactions during stress.

Kakihana, R., Blum, S., Kessler, S.: "Developmental study of pituitary-adrenocortical response in mice: plasma and brain corticosterone determination after histamine stress." *J. Endocrinol.* **60**: 353-358 (1974).

H83,418/74

In newborn mice, histamine caused a rise in plasma corticosterone between the sixteenth and twenty-first day of life, but not between the third and eleventh day. In the younger group the corticosterone levels of the brains of nonstressed controls were much higher than those of the older animals. Histamine significantly increased brain corticosterone during both periods, particularly in the stress-responsive older mice.

Galvin, M. J. Jr., Reichard, S. M.: "Hemoglobin and enzyme changes in stress." *Fed. Proc.* **33**: 317 (1974).

H84,077/74

In rats, histidine decarboxylase activity in the lung increases immediately after mechanical trauma. The "correlation of histamine production with the onset of hemoconcentration may be important in the pathophysiological changes leading to ultimate failure of the cardiovascular system."

Lorenz, W., Seidel, W., Doenicke, A., Tauber, R., Reimann, H.-J., Uhlig, R., Mann, G., Dormann, P., Schmal, A., Häfner, G., Hamelmann, H.: "Elevated plasma histamine concentrations in surgery: causes and clinical significance." *Klin. Wochenschr.* **52**: 419-425 (1974).

H86,774/74

In various animal species as well as in man, surgical interventions caused a discharge of histamine from diverse tissues, often accompanied by a rise in plasma histamine concentration. This response may account at least in part for hypotension, peptic ulcer formation and various other classic manifestations of stress. Unexpectedly, pre-operative medications may cause even more pronounced rises in plasma histamine than does the surgical intervention itself.

Kobayashi, R. M., Kopin, I. J.: "The effects of stress and environmental lighting on histamine in the rat brain." *Brain Res.* **74**: 356-359 (1974). J13,853/74

Review and personal observations on the effect of cold, restraint and various types of

illumination upon the histamine content of different regions in the rat brain.

Nandi, B. K., Subramanian, N., Majumder, A. K., Chatterjee, I. B.: "Effect of ascorbic acid on detoxification of histamine under stress conditions." *Biochem. Pharmacol.* **23**: 643-647 (1974). H81,833/74

In both rats and guinea pigs kept on an ascorbic acid-free diet, a variety of stressors (vaccines, toxoids, malnutrition, cold, heat, pregnancy) increased histamine formation and excretion into the urine. "Administration of large doses of ascorbic acid in any of the stressful situations resulted in a marked decrease in the urinary histamine level indicating detoxification of histamine in vivo."

Renin, Angiotensin

The renal pressor mechanism is undoubtedly also influenced during stress. In patients, operations under deep anesthesia raise renin secretion, presumably as a consequence of catecholamine release. The response is also modified by blood volume changes.

In severely burned patients, plasma renin and angiotensin II were usually extremely high, and the elevation persisted for days or weeks.

In healthy young men, exposure to high altitudes decreased plasma renin activity conjointly with urinary aldosterone excretion, roughly in proportion to the intensity of the mountain sickness that they developed. It remains to be shown whether this change is to be ascribed to lowered barometric pressure.

Rises in plasma renin were observed in patients undergoing various types of surgery or even anesthesia in preparation for surgery.

In rats, chronic exposure to stressors (sound, light, vibration) caused hypertension with increased turnover of NEP in the CNS. The chronic phase of this response was associated "with an action of angiotensin II on central receptors." In rats exposed to repeated electroshocks, the marked rises in the plasma concentrations of renin and corticosterone coincided. Hypophysectomy did not inhibit the increased plasma renin activity, which was blocked by dexamethasone and propranolol. Phentolamine increased it. Possibly, stress-induced renin release is mediated via β -adrenergic receptors, and corticoids modify this response.

Renin, Angiotensin

(See also our earlier stress monographs, p. xiii)

Lantos, C. P., Dahl, V., Basso, N., Cordeiro-Funes, J. R., Wassermann, G. F.: "A correlative study between adrenal function and the duration and intensity of an experi-

mentally produced disease of adaptation." *J. Steroid Biochem.* **2**: 335-347 (1971).

G88,441/71

In rats, stress produced by repeated intramuscular injections of formaldehyde caused a particularly pronounced increase in the secretion of aldosterone, and to a lesser extent of corticosterone, into the adrenal vein blood.

18-OH-DOC discharge was less markedly raised, and was not as clearly correlated with the intensity and duration of stress as were the other two corticoids. Plasma renin concentrations diminished during stress. The authors believe that "the present results exclude the possibility that the increased aldosterone secretion was secondary to an augmented plasma angiotensin concentration."

Pettinger, W. A., Augusto, L., Leon, A. S.: "Alteration of renin release by stress and adrenergic receptor and related drugs in unanesthetized rats." *Adv. Exp. Med. Biol.* **22**: 105-117 (1972). G94,419/72

Renin release noted after exposure to various stressors can be influenced by diverse drugs. "The beta-adrenergic blocking drug propranolol suppressed endogenous release of renin and inhibited renin release induced by stresses of swimming and anesthesia.... Suppression of endogenous renin release by propranolol could play a role in the antihypertensive properties of this drug in man."

Bailey, R. E., Bartos, D., Bartos, F., Castro, A., Dobson, R. L., Gretie, D. P., Kramer, R., Macfarlane, D., Sato, K.: "Activation of aldosterone and renin secretion by thermal stress." *Experientia* **28**: 159-160 (1972). H54,154/72

Robertson, D., Michelakis, A. M.: "Effect of anesthesia and surgery on plasma renin activity in man." *J. Clin. Endocrinol. Metab.* **34**: 831-836 (1972). H54,882/72

During surgery under deep anesthesia, plasma renin activity increases in patients. "Although catecholamine release and sympathetic discharge undoubtedly play a role in raising renin secretion during surgical stress, the results of the present study suggest that renin secretion during such stress is modified by blood volume changes."

Doleček, R., Závada, M., Adámková, M., Leikep, K.: "Plasma renin like activity (RLA) and angiotensin II levels after major burns. A preliminary report." *Acta Chir. Plast. (Praha)* **15**: 166-169 (1973). J9,675/73

In severely burned patients, plasma renin and angiotensin II were usually very high, and the rise persisted for days or weeks.

Buckley, J. P.: "Biochemical and physiological effects of intermittent neurogenic stress." In: Németh, Š., *Hormones, Metabolism and Stress. Recent Progress and Perspectives*, pp. 165-177. Bratislava: Slovak

Academy of Sciences, 1973. E10,466/73

Various stressors (sound, light, vibration) chronically applied to rats caused hypertension, with an increased NEP turnover in the CNS. Possibly, "the chronic phase of the response is associated with an action of angiotensin II on central receptors."

Hogan, R. P., Kotchen, T. A., Boyd, A. E., Hartley, L. H.: "Effect of altitude on renin-aldosterone system and metabolism of water and electrolytes." *J. Appl. Physiol.* **35**: 385-390 (1973). J5,657/73

In healthy young males, exposure to a simulated altitude of 12,000 ft. decreased plasma renin activity and urinary aldosterone excretion in proportion to the symptoms of acute mountain sickness that were manifested. It remains to be proven whether these changes are due to stress or to the specific effects of anoxia (45 refs.).

Tsukiyama, H., Otsuka, K., Kyuno, S., Fujishima, S., Kijima, F.: "Influence of immobilization stress on blood pressure, plasma renin activity and biosynthesis of adrenocorticoid." *Jap. Circ. J.* **37**: 1265-1270 (1973). H81,677/73

In rabbits, "shortly after the beginning of immobilization stress a remarkable elevation in the arterial pressure, a significant increase in plasma renin levels and plasma corticosterone concentrations were observed." However, the changes in plasma renin and corticosterone activity did not parallel one another, and hence there would appear to be different mechanisms activating the renin-angiotensin and pituitary-adrenocortical systems. EEG studies suggest that the homeostatic mechanisms mediated by the mesencephalic reticular formation and grey matter regulate blood pressure and renin release, while the hippocampus, amygdala and anterior hypothalamic area are less effective in this respect. The results of selective electric stimulation of various brain areas substantiate this interpretation.

Leon, A. S., Pettinger, W. A., Saviano, M. A.: "Enhancement of serum renin activity by exercise in the rat." *Med. Sci. Sports* **5**: 40-43 (1973). J11,490/73

In rats, serum renin activity was enhanced during stress caused by swimming, but this rise was "blocked by propranolol, suggesting that beta-adrenergic mechanisms are involved in increased renin release induced by exercise stress."

Leenen, F. H., Shapiro, A. P.: "Effect of

intermittent electric shock on plasma renin activity in rats." *Proc. Soc. Exp. Biol. Med.* **146**: 534-538 (1974). H87,670/74

In rats, repeated electroshocks caused a marked increase in both the renin and corticosterone concentrations of the plasma. Hypophysectomy did not inhibit the rise in plasma renin activity, which was blocked by dexamethasone and propranolol but potentiated by phentolamine. Presumably, the "stress-induced release of renin is mediated via β -adrenergic receptors and endogenous corticosteroids modify this response."

Gál, T. J., Cooperman, L. H., Berkowitz, H. D.: "Plasma renin activity in patients undergoing surgery of the abdominal aorta." *Ann. Surg.* **179**: 65-69 (1974). J9,433/74

Surgical anesthesia sufficed to increase plasma renin activity, but a further rise was noted following subsequent insertion of an aortic bifurcation graft and release of the cross-clamped aorta. [The observations do not permit differentiation between the role of stress and of the specific operative procedure (H.S.).]

Molteni, A., Zakheim, R. M., Mullis, K. B., Mattioli, L.: "The effect of chronic alveolar hypoxia on lung and serum angiotensin I converting enzyme activity." *Proc. Soc. Exp. Biol. Med.* **147**: 263-265 (1974). H95,543/74

In mice, hypoxia caused elevations in serum and lung angiotensin I converting enzyme, closely related to renal renin granules. "The significance of the stimulation of the renin angiotensin aldosterone system in the response to hypoxia remains unknown. It may be an adjustment to the stress of hypoxia or be necessary to the erythropoietic response."

Finberg, J. P. M., Katz, M., Gazit, H., Berlyne, G. M.: "Plasma renin activity after acute heat exposure in nonacclimatized and naturally acclimatized man." *J. Appl. Physiol.* **36**: 519-523 (1974). J12,804/74

Baumann, R.: "Theoretische und klinische Aspekte der zerebro-viszeralen Regulationskrankheit arterielle essentielle Hypertonie. I. Zu Problemen der Adaptations-Maladaptionsprozesse und der pathogenetischen Effizienz des psycho-emotionalen Stresses" (Theoretical and chemical analyses of cerebro-visceral regulation of essential arterial hypertension. I. Problems of adaptation-maladaptation processes and the pathogenetic efficiency of psycho-emotional stress). *Dtsch. Gesundheitsw.* **29**: 673-676 (1974).

Baumann, R.: "II. Hämodynamische und biochemische Regulationsstörungen des jugendlichen Hypertoniens unter Stressexposition" (II. Hemodynamic and biochemical disturbances in young male hypertensive patients under stress). *Dtsch. Gesundheitsw.* **29**: 721-733 (1974).

J15,329/74

In young hypertensive patients with or without latent diabetes, emotional stress produced a rise in plasma FFA, NEP and renin (63 refs.).

Carvalho, J. S., Shapiro, R., Hopper, P., Page, L. B.: "Methods for serial study of renin-angiotensin system in the unanesthetized rat." *Am. J. Physiol.* **228**: 369-375 (1975).

H99,301/75

"In the rat, most methods of blood collection involve stress of emotion, pain, or anesthesia. All these stimuli are known to increase the rate of renin secretion." The authors' findings were confirmed by an improved technique.

Acetylcholine

Neither cholinergic, adrenergic nor histaminergic blocking agents prevented ACTH secretion in the rat; hence, it was concluded that catecholamines, acetylcholine and histamine do not play an important role in activating the hypothalamus-pituitary system during stress in this species.

On the other hand, carbaminoylecholine and eserine injected into the septum, preoptic region, anterolateral hypothalamus or the dorsal tegmental area did inhibit pituitary-adrenal activity. Furthermore, ACTH secretion was increased by cholinergic stimulation of the medial and caudal hypothalamus as well as of the posterior hypothalamus and ventral tegmentum.

The acetylcholine content of various regions of the rat brain was not consistently

influenced by stress. However, implantation of atropine crystals into the anterior hypothalamus greatly inhibited ACTH secretion following exposure to various stressors, whereas similar implantations of other materials were ineffective. It was concluded that "the hypothalamic control of pituitary corticotropin may have a cholinergic component" which may regulate CRF discharge.

The deposition of small amounts of acetylcholine in the immediate extracellular environment of single cells in the CNS showed that some neurons are particularly sensitive to the direct effect of acetylcholine; these may be involved in ACTH discharge.

Acetylcholine

(See also our earlier stress monographs, p. xiii)

Guillemin, R.: "A re-evaluation of acetylcholine, adrenaline, nor-adrenaline and histamine as possible mediators of the pituitary adrenocortotropic activation by stress." *Endocrinology* **56**: 248-255 (1955).

C2,756/55

In rats, it was impossible to inhibit the ACTH release following stress (formalin, restraint) by pretreatment with adrenergic or cholinergic-blocking agents or antihistamines. It is concluded that EP, NEP and histamine are not indispensable or even important mediators of hypothalamus-pituitary activation by stress.

Endrőczi, E., Schreiberg, G., Lissák, K.: "The role of central nervous activating and inhibitory structures in the control of pituitary-adrenocortical function. Effects of intracerebral cholinergic and adrenergic stimulation." *Acta Physiol. Acad. Sci. Hung.* **24**: 211-212 (1963). G12,029/63

In the cat, pituitary-adrenocortical activation evoked by cholinergic and adrenergic drugs injected into various areas of the CNS has been examined. "Carbaminoylecholine and eserine injected into the septum, preoptic region, anterolateral hypothalamus or into the dorsal tegmental area, were found to inhibit pituitary-adrenal activity. Cholinergic chemical stimulation of the medial and caudal hypothalamus, as well as of the posterior hypothalamus and ventral tegmentum resulted in an increase of ACTH secretion. Adrenaline, nor-adrenaline and ephedrine increased ACTH secretion only when injected into the area of the posterior hypothalamus and ventral tegmentum. The suppression of adrenocortical activity in response to the cholinergic stimulation of the inhibitory structures of the forebrain could be blocked by the adrenergic stimulation of the posterior

hypothalamus." Apparently, chemical stimulation of the diencephalon and brain stem makes it possible to separate endocrine regulatory activities from complex behavioral reactions.

Bowers, M. B. Jr., Hartmann, E. L., Freedman, D. X.: "Sleep deprivation and brain acetylcholine." *Science* **153**: 1416-1417 (1966). F70,358/66

In rats, sleep deprivation caused "a significant fall in brain acetylcholine in the telencephalon; there were no significant changes in the diencephalon and brain stem. Restraint stress and activity wheel stress produced no significant change in acetylcholine levels in any of these regions; the telencephalic response to sleep deprivation, therefore, cannot be attributed to nonspecific stress."

Khanna, N. K., Madan, B. R.: "Effect of beta adrenergic blocking agents on stress induced changes in acetylcholine content of rat's myocardium." *Arch. Int. Pharmacodyn. Ther.* **175**: 136-140 (1968). H6,739/68

The cold stress-induced increase in the acetylcholine content of the rat myocardium is prevented by pretreatment with β -adrenergic blockers.

Hedge, G. A., Smelik, P. G.: "Corticotropin release: inhibition by intrahypothalamic implantation of atropine." *Science* **159**: 891-892 (1968). J11,294/68

In rats, implantation of atropine crystals in the anterior hypothalamus greatly inhibits ACTH secretion following surgical trauma, ether anesthesia and arginine vasopressin. Similar implantations in other nearby brain regions are ineffective. Presumably, "the hypothalamic control of pituitary corticotropin may have a cholinergic component" which may regulate the discharge of CRF.

Steiner, F. A., Ruf, K., Akert, K.:

"Steroid-sensitive neurones in rat brain: anatomical localization and responses to neurohumours and ACTH." *Brain Res.* **12**: 74-85 (1969). H28,002/69

Microelectrophoresis allows the deposition of minute amounts of soluble compounds in the immediate extracellular environment of single cells in the CNS, and a direct monitoring of the local response by recording single unit action potentials. With this technique it has been shown that in rats dexamethasone-sensitive cells scattered over wide areas can be identified and localized in the hypothalamus and midbrain. The majority of these cells are clearly inhibited, but some are activated. No steroid-sensitive neurons were found in the cortex, dorsal hippocampus or thalamus. The steroid-sensitive neurons were also responsive to microelectrophoretically-applied NEP and acetylcholine. The predominant action of the former was inhibition while that of the latter was stimulation. ACTH activated the steroid-sensitive neurons. Presumably, "specific nerve cells in the hypothalamus and midbrain are sensitive to both hormonal and humoral factors and involved in negative and positive feedback actions of the hormones."

Electroshock stress produced an increase in acetylcholine and a decrease in glycogen in the myocardium of the dog.

Allikmets, L. H.: "Cholinergic mechanisms in aggressive behaviour." *Med. Biol.* **52**: 19-30 (1974). J14,512/74

A review on brain 5-HT and catecholaminergic systems in aggressive behavior. It is suggested that the cholinergic trigger mechanism of aggressive behavior depends on brain 5-HT and catecholaminergic processes (75 refs.).

Pheromones

Pheromone has been considered as a possible stress hormone because, in fish, this substance (secreted by specialized cells in the epidermis) causes not only peculiar "fright and alarm behavior" but also flight or withdrawal. It has been designated as "alarm pheromone" and can allegedly enhance avoidance conditioning. Through all these effects, it appears to exert a protective, adaptive action.

Some similar compound may also exist in mammals. Mice exposed to the odor of an animal for which they expressed preference are repulsed by it upon application of stress to the "communicator." Removal of the olfactory mucosa abolished the odor aversion, indicating the presence of a "true pheromone." Possibly, the glands which secrete the pheromone are near the urethra; hence, the odor can be conveyed either by the urine or by direct excretion.

Pheromones

(See also our earlier stress monographs, p. xiii)

Skinner, W. A., Mathews, R. D., Parkhurst, R. M.: "Alarm reaction of the top smelt, *Atherinops affinis* (Ayres)." *Science* **138**: 681-682 (1962). D38,493/62

Thomson, D. A.: "Ostracitoxin: an ichthyotoxic stress secretion of the boxfish, *Ostracion lentiginosus*." *Science* **146**: 244-245 (1964). F21,880/64

Under conditions of stress, the boxfish exudes a nonprotein hemolytic poison designated as "ostracitoxin." Introduction of a newly captured, highly excited specimen into

an aquarium can cause the death of all other fish within a few minutes. Partial purification of the toxin suggests that it may be a steroid saponin. It is poisonous also for vertebrates. [Its possible relationship to pheromones is not mentioned (H.S.).]

Thines, G., Vandenbussche, E.: "The effects of alarm substance on the schooling behaviour of *Rasbora heteromorpha duncker* in day and night conditions." *Anim. Behav.* **14**: 296-302 (1966). J23,194/66

Rosenblatt, R. H., Losey, G. S. Jr.: "Alarm reaction of the top smelt, *Atherinops affinis*: reexamination." *Science* **158**: 671-672 (1967). J22,282/67

Review of the literature on the "alarm substance" in the skin of the minnow *Phoxinus laevis L.*, which alters the behavior of some species of fish in that they refuse food and dash toward cover. This "alarm reaction" in fishes is restricted to members of the order *Cypriniformes*. Contrary to other reports in the literature, the authors did not observe the alarm reaction in the top smelt *Atherinops affinis* (Ayres) when it was exposed to a methanol extract of whole top smelt; they regard this response as an experimental artifact (10 refs.).

Valenta, J. C., Rigby, M. K.: "Discrimination of the odor of stressed rats." *Science* **161**: 599-601 (1968).

F98,695/68

Rats can distinguish between the odor of stressed and nonstressed rats. "Five animals learned to interrupt an ongoing response when air from the cages of stressed rats was introduced into the test compartment, and to continue responding when air from unstressed rats was introduced. The discrimination does not seem to depend on recognition of odors of individual rats." This is tentatively ascribed to the production of pheromones.

Kimbrell, G. M., Weinrott, M. R., Morris, E. K. Jr., Scheid, J., Sangston, D.: "Alarm pheromone and avoidance conditioning in goldfish, *Carassius auratus*." *Nature* **225**: 754 (1970). H21,093/70

"The alarm reaction in fish is believed

to be produced by a chemical substance (pheromone) secreted by specialized cells in the epidermis." A crude preparation of "alarm pheromone" dropped into an aquarium, causes "not only 'fright' and 'alarm' behaviour but also flight or withdrawal." Presumably, the pheromone can even enhance avoidance conditioning. [It is not clear whether the "alarm reaction" described here is equivalent to the first phase of the G.A.S. (H.S.).]

Carr, W. J., Martorano, R. D., Krames, L.: "Responses of mice to odors associated with stress." *J. Comp. Physiol. Psychol.* **71**: 223-228 (1970). G75,361/70

"Male mice respond to an olfactory signal emitted by stressed mice."

Stevens, D. A., Köster, E. P.: "Open-field responses of rats to odors from stressed and nonstressed predecessors." *Behav. Biol.* **7**: 519-525 (1972). J21,339/72

"While stressing may not evoke an *alarm* pheromone, it seems likely that stressed rats do produce an odor with pheromonal qualities."

Rottman, S. J., Snowdon, C. T.: "Demonstration and analysis of an alarm pheromone in mice." *J. Comp. Physiol. Psychol.* **81**: 483-490 (1972). H79,754/72

"Mice exposed to the odor of a stressed nonspecific communicator demonstrated an aversion to the source of the odor, although prior to the stress they had demonstrated a preference for the source of the communicator's odor.... Mice that were socially isolated for 12 wk. after weaning could emit the odor when stressed but responded inappropriately. Subsequently, 15 wk. of social experience improved, but did not restore to normal, the odor aversion of the isolates. Removal of the olfactory mucosa abolished the odor aversion, indicating the presence of a true pheromone." Intense stress induced the mice to excrete an "alarm pheromone" that brings about avoidance behavior by the recipient. Possibly, the glands that secrete the pheromone are located either in or near the urethra. Hence, the odor can be conveyed either by the urine or by direct excretion.

Kinins

Blood kinin concentrations are increased by muscular stress in man, whereas emotional stress has an opposite effect. It has been suspected that blood kinin represents a humoral mechanism regulating adaptation of the cardiovascular system.

In rats exposed to endotoxin shock, inactivation of bradykinin by kininase is considerably diminished and this has been held responsible for the raised level of circulating bradykinin.

Kinins

(See also our earlier stress monographs, p. xiii)

J16,838/74

Observations on previously healthy young soldiers with combat wounds "suggest the liberation of bradykinin in septic shock."

Sardesai, V. M., Rosenberg, J. C.: "Proteolysis and bradykinin turnover in endotoxin shock." *J. Trauma* **14**: 945-949 (1974).

J18,604/74

Experiments on dogs and rats "suggest that in endotoxin shock the inactivation of bradykinin by kininase is considerably lessened, and that the extremely high level of circulating bradykinin is the result of its elaboration by increased proteolysis as well as its decreased inactivation by kininases."

Prostaglandins

Since patients with peptic ulcers have a deficient prostaglandin E concentration in plasma and gastric juice, and since such ulcers are related to stress, the possible participation of prostaglandins in the stress response must also be considered. During hemorrhagic stress, arterial prostaglandin levels are high. In this connection, the E and F types may be of the greatest importance.

Additional data concerning this subject will be found in the section on peptic ulcers, in which prostaglandins have been considered to play a major pathogenic role and are consequently recommended for treatment.

Prostaglandins

(See also our earlier stress monographs, p. xiii)

Horrobin, D. F., Manku, M. S., Karmali, R. A., Nassar, B. A., Greaves, M. W.: "Pro-lactin and prostaglandin synthesis." *Lancet* November 9, 1974, p. 1154. H95,470/74

Observations on rats suggest that increased LTH production during stress may stimulate prostaglandin synthesis.

ulcer of rat." *Experientia* **30**: 824-826 (1974). H90,543/74

In both intact and adrenalectomized rats, restraint causes gastric ulcers with a considerable rise in glucagon and a decrease in gastrin which are attributed to stress.

Goldstein, A. L., Hooper, J. A., Schulof, R. S., Cohen, G. H., Thurman, G. B., McDaniel, M. C., White, A., Dardenne, M.: "Thymosin and the immunopathology of aging." *Fed. Proc.* **33**: 2053-2056 (1974). H92,570/74

Thymosin, a low molecular weight acidic polypeptide isolated from thymus tissue, is probably a hormone. Its blood concentration is high in young and low in old people. Probably the thymus through secretion of thymosin and perhaps other hormones, can act at a distance and influence the function and development of lymphoid cells involved in cell-mediated immunity, thereby participating in the aging process.

OTHER METABOLITES

Lipids in General

Several review articles and monographs deal with lipid changes during stress. The most striking and constant alterations in lipid metabolism are an increase in blood cholesterol, FFA, lipid phosphorus and lipoproteins. Presumably, lipid mobilization is necessary to cope with heightened metabolic requirements during emergencies.

Since in most publications various lipid constituents are discussed conjointly, it would lead to countless unnecessary repetitions to cite each communication under every type of lipid constituent mentioned. Hence, with very few exceptions, we shall classify the literature according to that lipid metabolite which has received the greatest attention in a particular communication.

Cholesterol

Since cholesterol is a precursor of steroid hormones, its metabolism quickly attracted the attention of early investigators of the stress response. Virtually every acute stressor (anoxia, cold, fasting, hemorrhage, trauma, restraint and so on) produces a pronounced depletion of cholesterol stores in the adrenal and an increase in plasma cholesterol, usually associated with similar changes in vitamin C levels.

This has been amply confirmed by experiments, first in the rat, but also in other species including man, and it is generally regarded as one of the most characteristic features of the alarm reaction. It is usually accompanied by other typical manifestations of acute stress such as thymicolumphatic involution, peptic ulcers, eosinopenia, a discharge of ACTH, corticoids and catecholamines. However, all these changes do not necessarily run parallel, and the mechanism of their interdependence is far from being clarified.

In fact, some observations in this field are difficult to reconcile. For example, in normal people, large amounts of ACTH cause a decrease in serum cholesterol with the esterified fraction falling sooner than the free fraction. This response does not occur in Addisonians, and hence it was thought that the fall may be induced by the discharged corticoids, or that the blood cholesterol does not disappear if there is no adrenocortical tissue to use it for corticoid synthesis.

Furthermore, in normal dogs, inanition decreased plasma cholesterol, especially the esterified fraction. In rats, this plasma cholesterol change was inversely proportional to the size and cholesterol content of the adrenals. From this, it was actually concluded "that a physiological response to stress is a reduction of the total serum cholesterol." Even in rats, a week of exposure to mild restraint increased the cholesterol and ascorbic acid levels of the adrenals, whereas severe restraint produced inverse changes.

In general, the depletion of adrenal cholesterol is most pronounced in the acute alarm reaction elicited by severe stress, and disappears or increases during the stage of resistance.

On the other hand, among survivors of myocardial infarction, serum cholesterol values almost invariably rose during periods of life judged subjectively as being particularly stressful.

In a group of accountants, the highest serum cholesterol values were noted at periods of severe occupational stress, when income tax declarations became due, and this was associated with an acceleration of blood clotting. Similarly, the serum cholesterol values rose in medical students during examinations. Striking increases in serum cholesterol and triglycerides were also noted in people kept on a strictly constant diet, at times of anxiety, including difficulties in the family or the job, as well as during "stress interviews." Rises in serum cholesterol were observed in underwater demolition crews during periods of great stress; these again paralleled other manifestations of the alarm reaction, such as rises in serum uric acid and cortisol and so on.

Although, as we have said, a rise in serum cholesterol is considered one of the most typical manifestations of the alarm reaction, it appears to be influenced by a variety of hitherto unclarified conditioning factors (such as genetics, nutrition), which may account for some of the observations seemingly incompatible with this interpretation. Even in patients, one group of investigators quite regularly found decreased serum cholesterol levels as a result of surgical operations or presurgical anxiety. The decrease in adrenal and the increase in serum cholesterol are most manifest during acute intense

stress, and may be reversed when the stressor is mild or when adaptation to it diminishes the intensity of the demands made upon the body. These observations agree with our concept according to which the adrenal cortex is most indispensable for the acquisition, and much less for the maintenance of nonspecific resistance.

Although exposure to severe cold produced a significant decrease of adrenal ascorbic acid in the opossum and dog, it failed to do so in frogs, toads, chickens, mice, hamsters, rabbits and cats. Adrenal cholesterol concentrations remained unchanged in most of these species, and actual increases were observed in rabbits exposed to cold and in frogs treated with ACTH.

In closing this survey, it should be clearly stated that the typical stress-induced pattern of cholesterol changes consists of a decrease in the adrenal and an increase in the blood content of this compound. This is the reaction obtained in most cases; the occasional exceptions are not fully understood. In surveying the literature, the impression is gained that usually adrenal cholesterol is unchanged or above normal during moderate chronic stress, and an atypical fall in serum cholesterol occurs in patients whose cholesterol stores are depleted, for example, by chronic undernutrition or loss of appetite.

Cholesterol

(See also our earlier stress monographs, p. xiii)

Sayers, G., Sayers, M. A., Liang, T. Y., Long, C. N. H.: "The cholesterol and ascorbic acid content of the adrenal, liver, brain and plasma following hemorrhage." *Endocrinology* 37: 96-110 (1945). B512/45

In rats, severe hemorrhage decreases the cholesterol and ascorbic acid content of the adrenals, presumably as a consequence of its stressor effect. Hypophysectomy prevents these changes, whereas they are duplicated by ACTH. The cholesterol content of the liver and brain is unaffected by nonfatal hemorrhage, and plasma cholesterol falls during shock due to severe hemorrhage. The ascorbic acid content of the liver and plasma rises after mild, and falls after fatal hemorrhage. Brain ascorbic acid levels are unaffected.

Levin, L.: "The effects of several varieties of stress on the cholesterol content of the adrenal glands and of the serum of rats." *Endocrinology* 37: 34-43 (1945).

B364/45

In rats, various stressors (anoxia, cold, fasting) caused a depletion of adrenal cholesterol considered to be characteristic of the alarm reaction. The blood cholesterol levels were much more variable.

Long, C. N. H.: "The relation of cholesterol and ascorbic acid to the secretion of the

adrenal cortex." *Rec. Prog. Horm. Res.* 1: 99-122 (1947). A53,620/47

B53,036/50

Normal people given large amounts of ACTH develop pronounced drops in serum cholesterol after several days. The esterified fraction falls sooner than the free fraction. This effect of ACTH does not occur in those with Addison's disease. The fall may be induced by the discharged corticoids or by the utilization of blood cholesterol for the synthesis of corticoids under the influence of ACTH.

Kuhl, W. J. Jr., Ralli, E. P.: "Effect of acute stress upon blood constituents, white cells, and urine constituents in normal individuals." *Proc. Assoc. for the Study of Internal Secretions—33rd. Meet.*, p. 51. Atlantic City, N. J., 1951. Also in: *J. Clin. Endocrinol. Metab.* 11: 776 (1951).

B58,505/51

Normal men immersed in cold water (9.5°C) for eight minutes showed: 1—A decrease in temperature (immediate, 1 and 2 hours); 2—An increase in systolic and diastolic blood pressure (immediate) and a decrease (2 hours); 3—A decrease in heart rate (1, 2 and 4 hours); 4—An increase in neutrophiles (immediate); 5—A decrease in lymphocytes (2 hours); 6—A decrease in

eosinophiles (2 hours); 7—A decrease in serum chloride (immediate); 8—An increase in total proteins (immediate and 4 hours); 9—A decrease in serum water (immediate); 10—An increase in total cholesterol (4 hours); 11—An increase in the urine uric acid/creatinine ratio (2 and 4 hours)." All of these changes were significant and ascribed to stress, but no one indicator gave uniformly positive results.

Kyle, L. H., Hess, W. C., Walsh, W. P.: "The effect of ACTH, cortisone, and operative stress upon blood cholesterol levels." *J. Lab. Clin. Med.* **39**: 605-617 (1952).

B79,256/52

Mann, G. V., White, H. S.: "The influence of stress on plasma cholesterol levels." *Metabolism* **2**: 47-58 (1953). B76,678/53

"In normal dogs treatment with an environmental stress such as inanition produced a marked fall in the plasma cholesterol with a disproportionate reduction of the esterified fraction." In rats, this plasma cholesterol change was inversely proportional to the size and cholesterol content of the adrenals. Similar cholesterol alterations were produced in dogs by ACTH, whereas cortisone allowed a stabilization and rise of serum cholesterol to normal levels in human beings suffering from the stressor effect of disease. "It is proposed that a physiological response to stress is a reduction of the total serum cholesterol."

Bartlett, R. G. Jr., Miller, M. A.: "The adrenal cortex in restraint hypothermia and in adaptation to the stress of restraint." *J. Endocrinol.* **14**: 181-187 (1956).

C25,043/56

In rats, one week of exposure to mild restraint increased the ascorbic acid and to a lesser extent the cholesterol content of the adrenals. Restraint sufficiently severe to reduce body temperature produced inverse changes. Loss of cholesterol and ascorbic acid from the adrenals was particularly marked in animals restrained while exposed to cold.

Hammarsten, J. F., Cathey, C. W., Redmond, R. F., Wolf, S.: "Serum cholesterol, diet and stress in patients with coronary artery disease." *J. Clin. Invest.* **36**: 897 (1957). D32,061/57

In survivors of myocardial infarction, serum cholesterol values were routinely taken and stressful events in their lives registered. "It was striking that 19 of the 20 occasions of high cholesterol corresponded with periods

that had been separately judged as particularly stressful for the individuals concerned."

Friedman, M., Rosenman, R. H., Carroll, V.: "Changes in the serum cholesterol and blood clotting time in men subjected to cyclic variation of occupational stress." *Circulation* **17**: 852-861 (1958). C56,083/58

In a large group of accountants, "each subject's highest serum cholesterol consistently occurred during severe occupational or other stress, and his lowest at times of minimal stress. The results could not be ascribed to any changes of weight, exercise, or diet. Marked acceleration of blood clotting time consistently occurred at the time of maximum occupational stress, in contrast to normal blood clotting during periods of respite."

Wertlake, P. T., Wilcox, A. A., Haley, M. I., Peterson, J. E.: "Relationship of mental and emotional stress to serum cholesterol levels." *Proc. Soc. Exp. Biol. Med.* **97**: 163-165 (1958). C47,228/58

In male medical students the mental stress of examinations caused a considerable increase in serum cholesterol values, considered to reflect manifestations of the G.A.S.

Grundy, S. M., Griffin, A. C.: "Effects of periodic mental stress on serum cholesterol levels." *Circulation* **19**: 496-498 (1959).

C66,837/59

In male medical students the blood cholesterol levels rose significantly during final examinations.

Elton, R. L., Zarrow, I. G., Zarrow, M. X.: "Depletion of adrenal ascorbic acid and cholesterol: a comparative study." *Endocrinology* **65**: 152-157 (1959). C71,402/59

"Exposure to severe cold produced significant depression of adrenal ascorbic acid in opossums and dogs, but failed to do so in frogs, toads, chickens, mice, hamsters, rabbits, and cats. ACTH failed to produce such a depletion in frogs, toads, chickens, rabbits, cats, or dogs; significant depressions were observed in opossums, mice and hamsters. Adrenal cholesterol concentrations remained unchanged in most species tested, however, increases were observed in rabbits, following cold exposure, and in frogs, following ACTH treatment" (24 refs.).

Rose, K. D., Maca, R., Pace, D. M.: "Sterol synthesis by cells cultured on serum from heat-stressed chickens." *Proc. Soc. Exp. Biol. Med.* **108**: 282-285 (1961).

D89,507/61

"Young chickens subjected to heat stress at 102°F for 24 hours elaborate a stress factor into their blood stream. When serum from these animals is used as an adjuvant in a serum-balanced salt solution medium, cells grown on this medium accumulate large numbers of small lipid droplets within their cytoplasm." Possibly, this factor may account for the hypercholesterolemia characteristic of stress in vivo.

In rats, exposure to a variety of sounds (gongs, horns, loudspeakers, bells, vibrators) caused roughly parallel decreases in blood eosinophil and ascorbic acid concentrations in the adrenal and other tissues. On the other hand, chronic audiogenic stress led to increases in adrenal weight, ascorbic acid concentration and serum cholesterol.

Rahe, R. H., Arthur, R. J.: "Stressful underwater demolition training. Serum urate and cholesterol variability." *J.A.M.A.* **202**: 1052-1054 (1967). F91,967/67

In men training for underwater demolition work the serum urate concentration was elevated during anticipation of a demanding task, and "cholesterol levels rose concomitant with a period of particular psychological stress. Serum urate concentration demonstrated a significant fall during a period of quite intense psychological stress."

Symbas, P. N., Abbott, O. A., Ende, N.: "Surgical stress and its effects on serum cholesterol." *Surgery* **61**: 221-227 (1967).

G44,339/67

In opposition to most of the literature, the authors find that, after surgical stress, the serum cholesterol level is usually decreased in man, although sometimes an initial rise may be noted (19 refs.).

Iroshnikova, G. P.: "The blood cholesterol level and bile acids excretion depending on the degree and duration of functional stress of the nervous system." *Kardiologija* **8** No. 4: 48-54 (1968) (Russian). J23,895/68

"Prolonged functional stress of the nervous activity, not leading to the development of neurosis, may cause in rabbits an alteration of the cholesterol metabolism, this being manifested by an increased excretion of bile acids and wave-like fluctuation of the blood cholesterol level. The blood cholesterol con-

tent manifests a tendency to rise with increase of the functional stress."

Rahe, R. H., Rubin, R. T., Arthur, R. J., Clark, B. R.: "Serum uric acid and cholesterol variability. A comprehensive view of Underwater Demolition Team training." *J.A.M.A.* **206**: 2875-2880 (1968).

G63,836/68

Steigrad, A.: "Kleine Blutdruckamplitude bei Hypercholesterinämie. Beobachtungen über den Einfluss von Stress und Schilddrüsenfunktion" (Small blood pressure amplitude in hypercholesterolemia. Studies on the influence of stress and thyroid function). *Praxis* **57**: 1225-1228 (1968). H14,750/68

In man, psychogenic stress increases the blood cholesterol level. At the same time, thyroid activity (blood PBI) is usually, but not always, diminished (26 refs.).

Kasl, S. V., Cobb, S., Brooks, G. W.: "Changes in serum uric acid and cholesterol levels in men undergoing job loss." *J.A.M.A.* **206**: 1500-1507 (1968). J13,893/68

In people who lose their job or anticipate loss of employment, blood cholesterol and uric acid levels tend to rise, with a return to normal following the stress period of economic uncertainty.

Rubin, R. T., Rahe, R. H., Clark, B. R., Arthur, R. J.: "Serum uric acid, cholesterol and cortisol levels. Interrelationships in normal men under stress." *Arch. Intern. Med.* **125**: 815-819 (1970). G74,760/70

In healthy young U.S. Navy divers undergoing underwater demolition training, the physical and psychologic stress is associated with increases in serum uric acid, cholesterol and cortisol concentrations (34 refs.).

Kato, M.: "Sensitivity of cholesterol turnover in rat liver to cold environmental stress." *Am. J. Physiol.* **221**: 1255-1259 (1971). J19,652/71

Taggart, P., Carruthers, M.: "Endogenous hyperlipidaemia induced by emotional stress of racing driving." *Lancet* February 20, 1971, pp. 363-366. H35,851/71

During racing driving, "the total-catecholamine levels were grossly elevated, the increase being largely due to noradrenaline. The free-fatty-acid levels were also elevated one to three minutes before the start while the drivers were on the starting grid, and up to one hour after the race. The triglyceride levels were slightly elevated after the event, continued to increase, and reached a peak at

one hour." Blood cholesterol values showed no significant changes.

Rahe, R. H., Rubin, R. T., Gunderson, E. K. E.: "Measures of subjects' motivation and affect correlated with their serum uric acid, cholesterol, and cortisol." *Arch. Gen. Psychiatry* **26**: 357-359 (1972).

G90,674/72

Among trainees in a U.S. Navy underwater demolition team, "predominantly positive correlations were seen between the subjects' serum uric acid levels and their estimates of their own motivation. Their serum cholesterol concentrations demonstrated consistently negative correlations with their motivational and pleasant affect scores. Highest correlations were positive ones found between the subjects' serum cholesterol levels and their unpleasant affect scores. Serum cortisol correlations with the three psychological criteria demonstrated wide variability around a zero correlation baseline."

Kaatzsch, H.: "Endogene Cholesterinbildung bei Kraftfahrern, Akkord- und Schichtarbeitern" (Endogenous cholesterol synthesis in truck drivers, piece-workers and shiftworkers). *Med. Klin.* **67**: 262-266 (1972).

J16,980/72

In truck drivers and shiftworkers the increase in blood cholesterol roughly paralleled the elevation of blood catecholamines, and reflected the severity of the stress associated with work.

Rothfeld, B., Paré, W. P., Varady, A. Jr., Isom, K. E., Karmen, A.: "The effects of environmental stress on cholesterol synthesis and metabolism." *Biochem. Med.* **7**: 292-298 (1973).

J2,491/73

In rats, the stressor effect of sound or electroshock caused cholesterol deposition in the aorta and liver with a rise in blood cholesterol.

Rothfeld, B., Paré, W. P., Varady, A. Jr., Isom, K. E., Karmen, A.: "CPIB as a factor in stress-mediated effects on cholesterol syn-

thesis in metabolism." *Biochem. Med.* **8**: 324-328 (1973).

J21,509/73

When produced by electroshock or sound, "stress results in diminution if not disappearance of many previously noted effects of CPIB on cholesterol metabolism in the rat."

Fokin, A. S.: "The influence of a sustained functional stress of the central nervous system on cholesterol-lipoprotein metabolism, thyroid function, on the reaction of the adrenals in dogs with normal and suppressed function of the sexual glands." *Kardiologija* **13** No. 11: 69-73 (1973) (Russian).

J23,977/73

Rahe, R. H., Rubin, R. T., Arthur, R. J.: "The three investigators study. Serum uric acid, cholesterol, and cortisol variability during stresses of everyday life." *Psychosom. Med.* **36**: 258-268 (1974).

J21,223/74

The authors studied their own responses to various life events. "Marked elevations in serum cholesterol were seen in one investigator throughout an unpleasant residential move; repeated peaks in serum cortisol were seen in one investigator during times of anguish and anger over personal disappointments and work changes. Two of the three men showed uric acid elevations into the 'gout range' prior to eagerly taking on a physical change. Occasionally, serum uric acid and cortisol values reached magnitudes previously reported as characteristic of men entering underwater demolition training and jumping into the ocean from hovering helicopters."

Krekhova, M. A., Chekhranova, M. K.: "Cholesterol content in the venous blood of the adrenal glands and the peripheral blood of rats." *Probl. Endokrinol.* **20** No. 4: 81-83 (1974) (Russian).

H92,741/74

In rats, "surgical stress" decreased adrenal cholesterol 1.25 times more than would correspond to the secreted corticosterone. Corticosterone elimination coincided with the discharge of cholesterol esters from the adrenal cortex.

FFA, Triglycerides and Lipoproteins

A rise in plasma lipids and FFA is generally accepted as a characteristic manifestation of stress. In fact, extensive surveys have led to the conclusion that an elevated plasma FFA level is a particularly sensitive indicator of increased autonomic activities, such as occur during the alarm reaction, even during comparatively mild, emotionally-

induced stress situations caused by demanding social interrelations. The primary factor here appears to be the discharge of catecholamines, which are known for their lipolytic action.

This hyperlipidemia and elevation of blood FFA are usually associated with hyperlipoproteinemia; allegedly, these lipid changes can be selectively diminished by treatment with nicotinic acid.

Increased plasma FFA levels in man were also noted after excessive muscular exercise, hot baths, racing driving, exposure to gravity forces (centrifugation), exacting vigilance tests and so on.

In obese persons, exercise and perceptual judgment tasks elevated plasma FFA values very consistently, although the initial levels were low. Marked rises were also noted in a few obese patients exposed to heat.

FFA, Triglycerides and Lipoproteins

(See also our earlier stress monographs, p. xiii)

Kabal, J., Ramey, E. R.: "Effect of guanylic acid on plasma NEFA [FFA] response to stress." *Proc. Soc. Exp. Biol. Med.* **104**: 95-97 (1960). C90,828/60

Mallov, S., Witt, P. N.: "Effect of stress and tranquilization on plasma free fatty acid levels in the rat." *J. Pharmacol. Exp. Ther.* **132**: 126-130 (1961). D3,463/61

In rats, electroshocks raise the plasma FFA concentration. This in turn can be inhibited by tranquilizers (chlorpromazine, meprobamate), but only when given at certain dose levels at critical times.

Mayes, P. A.: "Blood glucose and plasma unesterified fatty acid changes induced by the stress of an emergency situation." *Experientia* **18**: 451-453 (1962). J23,455/62

Leites, S. M., Chou-Su: "Some features of fat metabolism during stress." *Vopr. Med. Khim.* **8**: 289-293 (1962) (Russian). Engl. trans.: *Fed. Proc.* **22**: 244-246 (1963). D60,206/62

Leites, S. M., Chou-Su: "Lipolytic activity of the aortic wall in certain experimental pathologic conditions." *Klin. Med. (Mosk.)* **40**: 15-21 (1962) (Russian). Engl. trans.: *Fed. Proc.* **22**: 466-469 (1963). G9,132/62

In rats, the stress of restraint increases both the blood FFA concentration and the lipolytic activity of adipose tissue. On the other hand, the lipolytic activity of the aorta and myocardium is diminished during stress.

This may be of pathogenic importance in cardiovascular disease.

Leonov, B. V., Lomova, M. A., Rudakov, I. A.: "Connection of radiosensitivity of rats with antioxidative activity of bone marrow and content of unesterified fatty acids in their blood under conditions of 'stress.'" *Radiobiologija* **3**: 518-522 (1963) (Russian). Engl. trans.: *Radiobiology* **3**: 43-49 (1963). J24,546/63

Experiments on rats "suggested that the increased expenditure of antioxidants under conditions of 'stress' may be connected with mobilization of fats from fat depots and that one of the mechanisms of the increase of radiosensitivity of animals in 'stress' can be the oxidation of mobilized lipids." It is assumed that crossed sensitization by stressors to x-rays may result from the loss of antioxidants during stress.

Back, K. W., Bogdonoff, M. D.: "Plasma lipid responses to leadership, conformity, and deviation." In: Leiderman, P. H. and Shapiro, D., *Psychobiological Approaches to Social Behavior*, pp. 24-42. Stanford, Cal.: Stanford University Press, 1964. J11,130/64

Detailed review on plasma FFA as an objective indicator of stress in man, particularly in social interrelations. Plasma FFA are very sensitive to changes in autonomic nervous activity, and are especially useful in assessing situational demands and group interactions.

Khan, A. U., Forney, R. B., Hughes, F. W.: "Stress of shocking stimulus on plasma free fatty acids in rats." *Arch. Int. Pharmacodyn. Ther.* **151**: 459-465 (1964). F26,604/64

Electroshock applied to rats for three minutes caused marked increases in blood FFA. However, repeated intermittent electric shocks were less effective or ineffective in this respect. "It is suggested that hyperglycemia resulting from the stress of electric shocks suppressed the plasma FFA response in the groups of rats in which no changes were observed."

Klein, R. F., Troyer, W. G., Back, K. W., Hood, T. C., Bogdonoff, M. D.: "Lipid mobilization in lean and obese subjects." *Ann. N. Y. Acad. Sci.* **131**: 662-672 (1965).
G8,825/65

Psychogenic and physical stresses were "inversely related to body size when the duration of fasting was held constant. Plasma FFA lability or variability was significantly greater in lean subjects, suggesting that their lipid mobilizing processes are more active than those of obese subjects."

Sapira, J. D., Lipman, R., Shapiro, A. P.: "Effect of restraint on free fatty acid mobilization in rats." *Psychosom. Med.* **27**: 165-170 (1965).

E7,294/65

Handbook article on the theoretical and practical applications of our knowledge concerning lipid, particularly FFA, metabolism as influenced by catecholamines, the ANS and stressors.

Klein, R. F., Troyer, W. G., Back, K. W., Hood, T. C., Bogdonoff, M. D.: "Experimental stress and fat mobilization in lean and obese subjects." *Metabolism* **14**: 17-25 (1965).
F26,728/65

Plasma FFA values in obese persons exposed to two stressors (exercise on a station-

ary bicycle, a difficult perceptual judgment task) revealed lower initial levels and diminished variability, as compared to those in nonobese subjects. "Insulin activity or adrenergic nervous system activity may be altered in obesity."

Schalch, D. S.: "The effect of physical stress and exercise in the human on growth hormone and insulin secretion." *Clin. Res.* **13**: 334 (1965).
F61,179/65

In man, various stressors (muscular exercise, electroconvulsive therapy, major surgery) increased plasma STH (radioimmunoassay) and FFA levels without affecting plasma insulin. The STH discharge "may be at least in part responsible for the mobilization of the readily oxidizable FFA which takes place during periods of increased energy requirements."

Peterfy, G., Pinter, E. J., Cleghorn, J. M., Pattee, C. J.: "Observations on the adrenergic mechanism of hyperadipokinesis of emotional stress." *Proc. Can. Fed. Biol. Soc.* **9**: 64 (1966).
F66,182/66

In men and women the emotional stress of threatening suggestions leads to hyperadipokinesis. "The primary factor appears to be the adrenergic nervous system." This response, associated with marked increases in plasma FFA and catecholamine levels, is prevented by a β -adrenergic blocking agent, propranolol.

Levi, L.: "Das Experiment am Menschen in der Psychosomatik" (Psychosomatic studies in man). *Verh. Dtsch. Ges. Inn. Med.* **73**: 58-70 (1967).
G85,102/67

In man, various psychic stressors cause hyperlipoproteinemia as well as increased blood FFA. Nicotinic acid treatment diminishes the blood lipids without influencing tachycardia, hypertension or catecholamine secretion. Hence it is assumed that nicotinic acid inhibits fatty acid mobilization within the adipose tissue itself.

Schalch, D. S.: "The influence of physical stress and exercise on growth hormone and insulin secretion in man." *J. Lab. Clin. Med.* **69**: 256-269 (1967).
G44,274/67

In man, plasma STH often rose during periods of physical stress or exercise, while insulin values remained unchanged or decreased. EP did not reproduce the release of STH. The failure of plasma insulin levels to rise in response to stress-induced hyperglycemia is consistent with the finding that EP infusion impairs insulin discharge. Plasma

glucose and FFA levels rose as expected during physical exercise. Presumably, certain stressors are diabetogenic not only because of EP and corticoid release, but also because of a discharge of STH on the one hand, and an EP-induced suppression of insulin secretion on the other.

Buchel, L., Guyonneau, M.: "Variations du taux plasmatique des acides gras libres et de la glycémie au cours de la contrainte du Rat blanc" (Changes in the plasma level of free fatty acids and blood glucose during restraint in white rats). *C. R. Soc. Biol. (Paris)* **161**: 289-292 (1967).

F85,806/67

Pinter, E. J., Peterfy, G., Cleghorn, J. M., Pattee, C. J.: "The influence of emotional stress on fat mobilization; the role of endogenous catecholamines and the β adrenergic receptors." *Am. J. Med. Sci.* **254**: 634-651 (1967). G52,170/67

Anxiety-inducing hypnotic suggestion increases catecholamine secretion and blood FFA. Pretreatment with β -adrenergic blocking agents inhibits the adipokinetic response.

Roux, J. F., Romney, S. L.: "Plasma free fatty acids and glucose concentrations in the human fetus and newborn exposed to various environmental conditions." *Am. J. Obstet. Gynecol.* **97**: 268-276 (1967).

J22,838/67

Observations on women exposed to various stressors show that "the regulation of fetal plasma FFA is controlled by the same mechanisms as those of the pregnant adult. The fetus is however, unable to respond to a high plasma glucose concentration as the pregnant woman does (i.e., by a decrease in plasma FFA concentration). This difference is probably due to a limited supply of fetal insulin and/or to the saturation of the enzyme systems synthesizing lipids in fetal tissues. Pathologic conditions of gestation and stresses in utero have no effect on the fetal plasma FFA concentrations. This is considered as an expression of fetomaternal homeostatic ability. Increase in fetal plasma FFA concentrations takes place after birth."

Hrubeš, V., Beneš, V.: "The plasma level of non-esterified fatty acids as an indicator of stress." *Activ. Nerv. Sup. (Praha)* **9**: 241-244 (1967) (Czech). J23,105/67

in man." *J. Nerv. Ment. Dis.* **147**: 196-201 (1968). G60,448/68

In man, a variety of stressors increase plasma FFA levels (24 refs.).

Hrubeš, V., Beneš, V.: "The time course of nicotinic acid on stress-induced changes in serum non-esterified fatty acids in rats." *Activ. Nerv. Sup. (Praha)* **10**: 45-48 (1968). J23,115/68

Back, K. W., Wilson, S. R., Bogdonoff, M. D., Troyer, W. G.: "Racial environment, cohesion, conformity and stress." *J. Psychosom. Res.* **13**: 27-36 (1969).

J22,201/69

Comparative studies on stress responses—especially the elevations of plasma FFA—in various groups, particularly blacks and whites.

Buchel, L., Liblau, L., Murawsky, M., Prioux-Guyonneau, M.: "Influence de substances psychotropes sur les variations du taux plasmatique des acides gras libres chez le rat contraint" (Influence of psychotropic substances on variations of total plasma free fatty acids in restrained rats). *Arch. Sci. Physiol.* **23**: 407-414 (1969).

G68,704/69

In rats, restraint severe enough to cause gastric ulcers diminishes the FFA content of the plasma, contrary to most other stressors.

Geisen, K., Meder, R.: "Effekt von Wärme auf das Wachstumshormon beim Menschen" (The effect of heat on growth hormone secretion in man). *Z. Kinderheilkd.* **106**: 308-313 (1969). H17,060/69

In four men taking hot baths, plasma STH and to a lesser extent FFA values rose, whereas plasma cortisol levels remained constant. Literature is cited to show that other stressors (pyrogens, physical exercise, heat) likewise raise the plasma STH levels.

Mays, E. T.: "The effect of surgical stress on plasma free fatty acids." *J. Surg. Res.* **10**: 315-319 (1970). J21,337/70

Jage, J., Olthoff, D., Kunze, D.: "Das Verhalten der freien Fettsäuren des Serums als Indikator sympatho-adrenaler Aktivität während Narkose und Operation" (The composition of serum free fatty acids as an indicator of sympatho-adrenal activity during anesthesia and surgery). *Dtsch. Gesundheitsw.* **26**: 488-492 (1971). H63,313/71

In man, anesthetics increased serum FFA levels, except for halothane, probably because it has a sympatheticolytic action. Among oper-

ations performed during anesthesia, intra-abdominal interventions caused the greatest FFA elevations. For inexplicable reasons, only mitral commissurotomy elicited a decrease in serum FFA.

Taggart, P., Carruthers, M.: "Endogenous hyperlipidaemia induced by emotional stress of racing driving." *Lancet* February 20, 1971, pp. 363-366. H35,851/71

During racing driving, "the total-catecholamine levels were grossly elevated, the increase being largely due to noradrenaline. The free-fatty-acid levels were also elevated one to three minutes before the start while the drivers were on the starting grid, and up to one hour after the race. The triglyceride levels were slightly elevated after the event, continued to increase, and reached a peak at one hour." The blood cholesterol values showed no significant changes.

Ruxin, R. L., Bidder, T. G., Agle, D. P.: "The influence of autonomic arousal on blood clotting time in patients receiving electroconvulsive treatments." *J. Psychosom. Res.* **16**: 185-192 (1972). J19,669/72

In patients, electroconvulsive treatments raised plasma FFA, but the observations "do not support previous reports demonstrating a direct relationship between arousal and decreased clotting time. Furthermore, they provide no evidence for the hypothesis that emotional factors may influence the pathogenesis of vascular disease or play a part in hemostasis during stress through changes in blood coagulability" (37 refs.).

Okada, Y., Matsuoka, T., Kumahara, Y.: "Human growth hormone secretion during exposure to hot air in normal adult male subjects." *J. Clin. Endocrinol. Metab.* **34**: 759-763 (1972). H54,871/72

In four obese adult males exposed to hot air (48°C) for one hour after an overnight fast, elevation of body temperature was associated with increased plasma STH and FFA levels. No significant changes in cortisol, total thyroxine-iodine, blood glucose or hematocrit were noted. In two subjects, administration of glucose before heat exposure prevented the rise in plasma STH.

Sarviharju, P. J., Vihko, V.: "Plasma FFA during psychophysical loading and endurance training." *J. Sports Med. Phys. Fitness* **12**: 250-257 (1972). H81,647/72

Stress produced in male students by intense work on a bicycle ergometer or a difficult mental choice situation greatly increased

catecholamine excretion. Plasma FFA elevations were noted only after the physical work.

Harrison, M. H.: "Comparison of the metabolic effects of centrifugation and heat stress in man." *Aerosp. Med.* **44**: 299-303 (1973). H80,109/73

In fasted men the stress of centrifugation or exposure to heat increased blood lactate, glucose, FFA, glycerol and catecholamine levels, but these changes did not always parallel each other (30 refs.).

Turton, M. B., Deegan, T.: "Central and peripheral levels of plasma catecholamines, cortisol, insulin and non-esterified fatty acids." *Clin. Chim. Acta* **48**: 347-352 (1973). J8,031/73

In patients undergoing cardiac catheterization, elevations of EP, NEP, FFA and cortisol, and lowered levels of insulin, are ascribed to stress. However, certain differences are noted in the concentration of these substances in various vascular territories.

O'Hanlon, J. F., Horvath, S. M.: "Interrelationships among performance, circulating concentrations of adrenaline, noradrenaline, glucose, and the free fatty acids in men performing a monitoring task." *Psychophysiology* **10**: 251-259 (1973). J3,116/73

In young men performing an exacting vigilance test, basal blood, EP and NEP levels were inversely related to glucose. EP initially increased during the test but later returned to its basal level in proportion to performance. NEP was not related to performance. Glucose and FFA were elevated both during the task and throughout a control period spent watching slide projections.

Somerville, W.: "Emotions, catecholamines and coronary heart disease." *Adv. Cardiol.* **8**: 162-173 (1973). J16,987/73

A statistical study shows that "certain experienced motor-car drivers with a history of coronary heart disease when driving in busy traffic develop angina, sinus tachycardia, ectopic beats and various arrhythmias. Healthy racing drivers, stimulated by the emotions of competition and danger, develop high-grade sinus tachycardia, raised plasma catecholamines and free fatty acids immediately before and after a race. Public speaking induces in normal persons similar changes in heart rate and rhythm and elevations in plasma catecholamines and free fatty acids. In both drivers and public speakers, triglycerides show a peak elevation 1-2 h after the event. Oxprenolol inhibits the increase in

heart rate, plasma catecholamines, free fatty acids and triglycerides."

Numano, F., Kobayashi, M., Moriya, K., Numan, F., Shimamoto, T.: "Plasma free fatty acid and acute vascular injury." *Acta Pathol. Jap.* **23**: 769-777 (1973).

J10,126/73

In rabbits, various types of chemically induced vascular injury are associated with a marked increase in plasma FFA.

biochemische Regulationsstörungen des jugendlichen Hypertoniens unter Stressexposition" (II. Hemodynamic and biochemical disturbances in young male hypertensive patients under stress). *Dtsch. Gesundheitsw.* **29**: 721-733 (1974). J15,329/74

In young hypertensive patients with or without latent diabetes, emotional stress produced a rise in plasma FFA, NEP and renin (63 refs.).

Michailov, M. L., Gnüchtel, U., Nitschkoff, S., Baumann, R., Gnauck, G.: "Verhalten von Fettsäuren im Blutplasma von Affen nach Einwirkung kurzfristiger Stressoren" (The behavior of fatty acids in blood plasma of monkeys following exposure to short-time stressors). *Acta Biol. Med. Ger.* **32**: 675-680 (1974). J16,605/74

In baboons (*Papio hamadryas*), various stressors (restraint, jealousy) cause a rise in unsaturated plasma FFA, especially oleic acid, and a relative decrease in saturated FFA, particularly palmitinic acid.

Ferguson, J. H., Shultz, T. D.: "Plasma free fatty acid composition before and after cold exposure in the white rat." *Int. J. Biochem.* **6**: 69-72 (1975). J22,458/75

Phospholipids

In naval aviators during combat, the plasma phospholipid fractions allegedly behaved differently than in individuals exposed to other stressors in that phosphatidylglycerol "responded to this type of stress more markedly and consistently than other fractions."

In rats, ionizing radiation or acceleration stress consistently increased plasma phosphatidylglycerol. Similar rises in this fraction were also noted in people stressed by acceleration to grayout, sleep deprivation, combat, schizophrenia and so on, suggesting that the response is nonspecific. In rats, it can be prevented by hypophysectomy.

Phospholipids

(See also our earlier stress monographs, p. xiii)

Austin, F. H. Jr.: "A review of stress and fatigue monitoring of naval aviators during aircraft carrier combat operations: blood and urine biochemical studies." In: Bourne, P. G., *The Psychology and Physiology of Stress: With Reference to Special Studies of the Viet Nam War*, pp. 197-218. New York and London: Academic Press, 1969.

E8,568/69

Review on stress and fatigue monitoring in naval aviators during combat operations on a U.S. Navy aircraft carrier in North Vietnam. Plasma phospholipid fractions behaved differently than in normal individuals or in those exposed to other stressors. "The phosphatidylglycerol responded to this type of stress more markedly and consistently than the other fractions. A discriminant functions formula has been developed which may facilitate identification of the stress type and degree of subject response up to and includ-

ing psychophysiological exhaustion and collapse." Variations in typical stress hormone levels are also reported.

Polis, B. D., Polis, E., Cani, J. de, Schwarz, H. P., Dreisbach, L.: "Effect of physical and psychic stress on phosphatidyl glycerol and related phospholipids." *Biochem. Med.* 2: 286-312 (1969). G65,013/69

In rats exposed to ionizing radiation or "acceleration stress," the plasma concentration of phosphatidylglycerol was consistently increased. "Extension of the studies to humans stressed by acceleration to grayout, sleep deprivation, schizophrenia, combat, etc., revealed that all stresses were accompanied by significant increments in plasma

phosphatidyl glycerol." In rats, hypophysectomy prevented the increase in phosphatidylglycerol induced by acceleration stress; yet a rise in the brain level of this compound was shown even in the absence of the pituitary.

Polis, B. D., Polis, E., Schwarz, H. P., Dreisbach, L.: "The effect of cold on the composition of the phospholipids of the blood plasma of healthy athletes." *Proc. Soc. Exp. Biol. Med.* 145: 70-73 (1974).

J21,416/74

In athletes, the phosphatidylglycerol content of plasma was very significantly elevated immediately after and for seven minutes following exposure to cold.

Proteins and Amino Acids

The fact that stress causes catabolism and loss of body weight is so well known that it need not be discussed here in detail. Of course, stress-induced catabolism is not due exclusively to degradation of body proteins. Increased utilization of lipid and carbohydrate reserves is equally important, but since an initial loss and subsequent restoration of structure proteins is most characteristic of the stress response, body weight changes have been discussed at the very beginning of this section on metabolism.

Such an arbitrary classification has been adopted to avoid unnecessary repetitions, although separate sections deal with lipid and carbohydrate as well as with electrolyte and water metabolism, all of which can cause important modifications in total body weight.

In man, mere discussion of stressful subjects for one hour elicits diuresis with increased electrolyte and nitrogen elimination, concurrently with the typical rise in 17-OHCS excretion.

Additional observations in man showed that both emotional and physical stressors cause alterations in blood proteins, including the "acute phase reaction" accelerated blood clotting time and a particularly pronounced rise in the 4S and 19S class of serum proteins. (See also Blood Clotting under Functional Changes.)

Several monographs deal with the complex changes in protein metabolism and the protein constitution of various tissues under stress.

Proteins and Amino Acids

(See also our earlier stress monographs, p. xiii)

Hetzel, B. S., Schottstaedt, W. W., Grace, W. J., Wolff, H. G.: "Changes in urinary 17-hydroxycorticosteroid excretion during stressful life experiences in man." *J. Clin. Endocrinol. Metab.* 15: 1057-1068 (1955).

C8,424/55

In patients a one-hour discussion of

"stressful subjects" caused diuresis with increased 17-OHCS, nitrogen, sodium and potassium elimination.

Hetzel, B. S., Schottstaedt, W. W., Grace, W. J., Wolff, H. G.: "Changes in urinary nitrogen and electrolyte excretion during stressful life experiences, and their relation to thyroid function." *J. Psychosom. Res.* 1: 177-185 (1956).

E83,418/56

Studies on serum PBI, urine flow, total

nitrogen, sodium and potassium "suggest that the thyroid may be participating in a rapid metabolic adjustment, but the mechanism involved is not clear from existing knowledge of the thyroid hormone."

Fessel, W. J.: "Mental stress, blood proteins, and the hypothalamus." *Arch. Gen. Psychiatry* 7: 427-435 (1962).

D69,380/62

"The word stress is used according to Selye's definition: Stress is a non-specific deviation from the normal resting state; it is caused by function or damage and it stimulates repair." Review of the literature on alterations of blood proteins and accelerated blood clotting time in man, due to the influence of various emotional and physical stressors. The diencephalon and hypothalamus affect blood proteins through immunologic mechanisms. In the present experiments on man, severe mental stress was noted to cause a rise in 4S and 19S class serum proteins. "It is speculated that functional behavior disturbances are but one expression of a general metabolic disorder which is contributed to by the effects of both stress and hypothalamic-hypophyseal action" (61 refs.).

Jayle, M. F.: "Rôle du métabolisme des glycoprotéines dans la biogénèse de l'athérosclérose. Concept sur le 'syndrome général de l'agression'" (Role of the metabolism of glycoproteins in the biogenesis of atherosclerosis. Concept of the "general stress syndrome"). *Ann. Thér.* 14: 11-22 (1963).

G63,439/63

Under various stress conditions, the plasma levels of fibrinogen and of the glycoproteins haptoglobin and seromucoid are characteristically increased; this may play an important part in stress-induced atherosclerosis. The common denominator of the diseases of adaptation and of stress responses may be a rise in these compounds which might thus correspond to the "first mediator." This interpretation might act as a valid focal point of Selye's "unitary concept" although the claims concerning the central role of the pituitary-adrenal axis are rejected.

Braksh, T. A., Popova, A. V.: "Tryptophan requirements under nervous stress." *Vopr. Pitani.* 23 No. 6: 21-25 (1964) (Russian).

Munro, H. N.: "A general survey of pathological changes in protein metabolism." In: Munro, H. N. and Allison, J. B., *Mammalian Protein Metabolism*, Vol. 2, pp. 267-319.

New York and London: Academic Press, 1964. G79,177/64

Monograph on protein metabolism with an extensive section on the effects of stressors, including infection, trauma, undernutrition, heat, cold, muscular exercise and psychologic overstimulation.

Weimer, H. E., Godfrey, J. F.: "Effects of inanition, semistarvation, and protein-free diets on serum proteins." *Amer. J. Physiol.* 206: 331-334 (1964). F1,697/64

Lombart, C.: Thesis, Université de Paris, 1965. J11,880/65

Strong inflammatory processes with a pronounced stressor effect increase the secretion of haptoglobin in the rat.

Schumer, W.: "Metabolic considerations in the preoperative evaluation of the surgical patient." *Surg. Gynecol. Obstet.* 121: 611-620 (1965). F48,023/65

"The organism in stress has a dual function in relation to protein metabolism. Its duality lies in the fact that it will catabolize the protein pool of lean tissue mass in order to promote healing.... It is this shrinking of the protein stores that causes the marked catabolic wastage of the patient in surgical stress which is reinforced by lessened activity. The latter results in diminished food and water intake producing protein degradation for energy production. These factors emphasize the importance of preoperative, transoperative, and postoperative nutrition to avoid any increase in the catabolic nature of stress" (58 refs.).

Agostino, D., Girolami, A.: "Influenza dello stress sul fibrinogeno e sulla fibrinolisi ematica. [Nota sperimentale.]" (Influence of stress on fibrinogen and hematic fibrinolysis [Experimental note]). *Arch. Maragliano Patol. Clin.* 21: 137-141 (1965).

J25,102/65

Nitrogen metabolism in rats undergoing the stress of various surgical operations is associated with a pronounced hyperfibrinogenemia. These changes in the blood coagulation mechanism after stress can be considered as part of the first phase (alarm reaction) of the general adaptation syndrome of Selye.

Leon, H. A., Feller, D. D., Neville, E. D., Daligcon, B.: "Stress induced stimulation of liver protein synthesis independent of adrenal or pituitary action." *Life Sci.* 4: 737-741 (1965). G28,287/65

In vitro observations using labeled valine suggest that "the large increases in incorporation seen with adrenalectomized or hypophysectomized rats show that a mechanism independent of hormones released by the adrenal or pituitary glands is rapidly invoked by centrifugation stress and exerts a considerable influence over the rate of liver protein synthesis."

Weimer, H. E., Godfrey, J. F.: "Nutritional stress and the acute-phase reactants of rat serum in experimental inflammation." *Can. J. Physiol. Pharmacol.* **43**: 925-935 (1965). F53,959/65

Observations suggesting "that the response of the acute-phase reactants of rat serum to tissue injury is of such magnitude that it is not suppressed by several types of severe nutritional stress." In man as well as in other animals, the "characteristic changes are a decreased albumin level and increased levels of protein-bound carbohydrates, α_2 -globulin, fibrinogen, and the seromucoid fraction. In man, a new serum protein, C-reactive protein, appears and erythrocyte sedimentation rates are elevated. The components involved have been generally classified as acute-phase reactants since they usually exhibit a degree of parallelism toward each other in their deviation from normal during an inflammatory reaction." The authors do not discuss to what extent stressors not causing inflammation would affect acute-phase reactants.

Beauge, L. A., Palma, J. A.: "Modificacion del proteinograma en el 'stress' por inmovilizacion de la rata. Accion de la piridoxina" (Change in the proteinogram in "stress" caused by immobilization of the rat. Action of pyridoxine). *Rev. Soc. Argent. Biol.* **41**: 31-35 (1965). F63,084/65

Crockson, R. A., Payne, C. J., Ratcliff, A. P., Soothill, J. F.: "Time sequence of acute phase reactive proteins following surgical trauma." *Clin. Chim. Acta* **14**: 435-441 (1966). J22,863/66

Acute stress situations cause characteristic changes, especially in a group of plasma proteins referred to as "acute phase reactive proteins." Among these are C-reactive protein, orosomucoid, haptoglobin, the α_1 -acid glycoprotein of Schultze, fibrinogen, ceruloplasmin and α_2 -macroglobulin; the latter fails to rise following surgical interventions. "C-reactive protein, unique in being undetectable in normal sera, is most consistent in response and is therefore probably the most

satisfactory single screening test of an 'acute phase' reaction" (16 refs.).

Rao, V. V. S., Gupta, M. L.: "Effect of heat and cold stress on brain glutamic acid." *Fed. Proc.* **25**: 1185-1186 (1966).

F69,403/66

In rats, exposure to either cold or heat reduced the glutamic acid content of the brain.

Majumdar, C., Tsukada, K., Lieberman, I.: "Liver protein synthesis after partial hepatectomy and acute stress." *J. Biol. Chem.* **242**: 700-704 (1967). J21,396/67

In partially hepatectomized rats, stress caused by intraperitoneal Celite increases serum albumin and fibrinogen synthesis, presumably because the ability of liver polyribosomes to form protein is enhanced.

Clay, M. M., Adler, M. W.: "Alterations in hyaluronidase activity and serum protein electrophoretic patterns after chronic heat stress." *J. Pharm. Sci.* **56**: 756-767 (1967). F80,259/67

E10,459/73

In rats, both the anticipation and the actual stress of restraint increase the uptake of labeled leucine into brain cortical slices. This uptake is not reflected by enhanced incorporation into proteins. The phenomenon appears to be due to activation of the hypothalamus-hypophyseal-adrenal axis, since it is prevented by adrenalectomy.

Carbohydrates, Lactic Acid

It was repeatedly noted during the early years of this century that emotional glycosuria or "Fesselungsdiabetes" occurs during restraint in various species, particularly in cats. Considerable importance was attached to this finding, since a temporary "diabetes" was also noted in patients following severe emotional upset. These observations were probably the first indications of some relationship between stress and diabetes. They also represented an early clearcut example of an objective, quantitatively measurable psychosomatic change. However, since in cats this response could be abolished by adrenalectomy, and EP was the only known adrenal hormone, emotional glycosuria had been ascribed exclusively to EP discharge. The mobilization of sugar into the blood was considered to be helpful for supplying energy to muscles during the "fight or flight" emergency response of Cannon.

However, by 1940 it was evident that, during stress, hyperglycemia is not the only blood sugar response, and emotional excitement not its sole cause. Many other stressors were found to induce transient hyperglycemia in various species, but they could also elicit hypoglycemia. It became clear, furthermore, that blood sugar regulation during stress is not exclusively under the control of EP.

For example, during a particularly pronounced alarm reaction, produced by severe formaldehyde intoxication in the rat, hypoglycemia developed and this could be at least partially inhibited by a crude adrenocortical extract ("cortin").

A great deal has been written about the clinical syndrome of "functional hypoglycemia," which is allegedly closely related to stress, especially in neuropsychiatric patients. The mechanism and even the existence of this condition as a special syndrome have not yet been established with sufficient precision to permit discussion here. It has often been observed, however, that patients with neuropsychiatric disease suffer from anomalies in carbohydrate metabolism, although it is usually difficult to establish whether these are the cause or the consequence of the nervous manifestations.

It has long been known that a pure mineralocorticoid, such as DOC, can diminish stress-induced hyperglycemia, presumably owing to the inhibition of glucocorticoid secretion. This was the first observation showing that "overdosage with one of the compounds, produced by an endocrine cell, can interfere with the production by the same cell of other hormonal compounds." In this case, a mineralocorticoid can inhibit the production and the effect of a glucocorticoid.

In any event, the action of stress upon glucose metabolism depends upon so many conditioning factors that these will have to be consulted in the individual studies listed in the abstract section. This is easily understandable if we keep in mind that stress influences the production and activity of virtually every hormone that regulates carbohydrate metabolism, particularly catecholamines, ACTH, corticoids, STH, glucagon and insulin.

It is worth mentioning here, however, that serum hexosamine levels increase under the influence of various stressors in man, although the rise of blood hexosamine, unlike that of glucose, is independent of the adrenal cortex.

In man, as well as in various other mammals, serum and urinary lactic acid also rise under the influence of stress. These changes, as well as the depletion of glycogen stores, are similarly of great importance in regulating carbohydrate and energy metabolism during emergencies.

Carbohydrates, Lactic Acid

(See also our earlier stress monographs, p. xiii)

Cannon, W. B., Shohl, A. T., Wright, W. S.: "Emotional glycosuria." *Am. J. Physiol.* **29**: 280-287 (1912). B26,719/12

Personal observations on emotional glycosuria in cats separately caged next to a barking dog, and review of earlier literature dealing with "Fesselungsdiabetes" elicited by restraint in cats, and the appearance of diabetes in patients following severe emotional upset. In cats, emotional glycosuria after restraint is abolished by adrenalectomy, presumably as a consequence of EP-induced hyperglycemia. "A mobilization of sugar in the blood under these circumstances might be of signal service to the laboring muscles."

Selye, H., Dosne, C., Bassett, L., Whitaker, J.: "On the therapeutic value of adrenal cortical hormones in traumatic shock and allied conditions." *Can. Med. Assoc. J.* **43**: 1-8 (1940). A32,768/40

During the shock phase of the alarm reaction produced by heavy formaldehyde dosage in the rat, there is hypochloremia, hypoglycemia and hemoconcentration, all of which can be at least partially inhibited by a crude cortical extract (cortin). This is even more obvious in surgical shock produced by partial hepatectomy, but here a specific effect of hepatic insufficiency could not be excluded.

Gellhorn, E., Feldman, J., Allen, A.: "Effect of emotional excitement on the insulin content of the blood. Contribution to physiology of the psychoses." *Arch. Neurol. Psychiatry* **47**: 234-244 (1942). A37,798/42

In psychotic patients, emotional excitement

considerably increases the blood insulin level, although the blood sugar usually remains unaffected. In normal persons, excitement causes a rise in blood sugar but not in plasma insulin. "The experiments are interpreted to mean that the balance of the autonomic centers in psychotic patients under emotional stress is shifted toward the vagoinsulin side whereas in normal persons the sympathetic-adrenocortical system greatly predominates."

Rennie, T. A. C., Howard, J. E.: "Hypoglycemia and tension-depression." *Psychosom. Med.* **4**: 273-282 (1942). B19,676/42

Description of a syndrome designated as "functional hypoglycemia," which can occur in a predisposed patient when any one of the many factors of blood sugar homeostasis is interfered with. It is especially common among patients with a variety of neuropsychiatric disturbances, and appears to be the result of these, since it disappears when the latter are successfully treated. This syndrome is often difficult to distinguish from adrenocortical deficiency or hyperinsulinism.

Selye, H., Dosne, C.: "Physiological significance of compensatory adrenal atrophy." *Endocrinology* **30**: 581-584 (1942).

A37,249/42

In rats, large doses of DOC inhibit but do not prevent the adrenal enlargement characteristic of the alarm reaction following treatment with such stressors as cold, formaldehyde, atropine, trauma or forced muscular exercise. As a result of this inhibition the resistance of the DOC-treated animals to stressors is actually subnormal, since they are unable to produce optimal amounts of glucocorticoids. The hyperglycemia of the alarm reaction (presumably useful in providing en-

ergy during stress) is likewise diminished by DOC pretreatment. It is apparent that "overdosage with one of the compounds produced by an endocrine cell can interfere with the production by the same cell of other hormonal compounds (in this case corticoids, such as corticosterone, active in carbohydrate metabolism). As a result of this interference symptoms of overdosage with hormones produced by a certain endocrine cell type may coexist with signs of deficiency in the hormone production of that same cell."

Pincus, G.: "Adrenal cortex function in stress." *Ann. N.Y. Acad. Sci.* **50**: 635-645 (1949). B37,780/49

General review on changes in adrenocortical function during stress and psychiatric illness. Special emphasis is placed upon blood sugar, blood lymphocytes, corticoids and 17-KS.

Hinkle, L. E. Jr., Wolf, S.: "The effects of stressful life situations on the concentration of blood glucose in diabetic and non-diabetic humans." *Diabetes* **1**: 383-392 (1952).

B75,041/52

In healthy people, stressful life experiences usually cause a fall in the postabsorptive blood glucose concentration, often to definitely hypoglycemic levels, and a rise in circulating ketone bodies. In diabetics, definite ketoacidosis sometimes ensues in association with hyperglycemia (26 refs.).

Burns, T. W., Engel, F. L., Viau, A., Scott, J. L. Jr., Hollingsworth, D. R., Werk, E.: "Studies on the interdependent effects of stress and the adrenal cortex on carbohydrate metabolism in man." *J. Clin. Invest.* **32**: 781-791 (1953). B84,911/53

Observations on the effect of cortisone on carbohydrate metabolism during stress as well as after insulin or glucose administration "are considered to be compatible with the concept that there is an interaction between stress and adrenal hormone in modifying carbohydrate metabolism. They are not reconcilable with the view that the metabolic alterations during stress are direct consequences of adrenal cortical hypersecretion."

Stullken, D. E., Hiestand, W. A.: "Hematological changes influenced by short and long exposure to cold." *Proc. Soc. Exp. Biol. Med.* **86**: 253-255 (1954). B95,324/54

In mice, brief or prolonged exposure to cold produced no significant change in blood hemoglobin or red cell count but in the acute

state it raised the blood sugar level. These findings are discussed in relation to the G.A.S.

Merrick, A. W.: "Cardiac glycogen following fulminating anoxia." *Am. J. Physiol.* **176**: 83-85 (1954). G62,149/54

In the goldfish, cardiac glycogen stores are extremely high and difficult to exhaust, even by fulminating anoxia. "Cardiac glycogen is an emergency stand-by used by the heart during periods of anoxic stress." However, complete removal of cardiac glycogen is not necessary for the induction of cardiovascular and respiratory failure, and the observations do not prove any particular resistance of this fish to other stressors.

Boas, N. F., Bollet, A. J., Bunim, J. J.: "Effect of acute clinical stress on the levels of hexosamine in serum and its excretion in urine." *J. Clin. Invest.* **34**: 782-789 (1955).

C5,708/55

In man, serum hexosamine increased under the influence of various stressors (myocardial infarction, surgical operations, acute attacks of gout). ACTH or cortisone administration reduced the elevated serum hexosamine levels in rheumatic fever, rheumatoid arthritis and lupus erythematosus. ACTH had no effect when the urinary excretion and the serum levels of hexosamine were normal before treatment. In a patient with Addison's disease, the serum hexosamine still rose during stress. "Stress-hexosamine response in the serum and urine does not appear to be mediated by the adrenal cortex" (20 refs.).

Rice, C. O., Strickler, J. H., Tzeris, H.: "The relationship of an elevated blood sugar to an electrolyte imbalance." *Arch. Surg.* **72**: 508-513 (1956). D92,510/56

In man, stress-induced hyperglycemia is associated with electrolyte imbalance.

Manes, P. A.: "Blood glucose and plasma unesterified fatty acid changes induced by the stress of an emergency situation." *Experientia* **18**: 451-453 (1962). J23,455/62

Fedday, Z., Clay, M. M.: "Acid mucopolysaccharide content of dermal connective tissue of normal and stressed rats." *Nature* **202**: 907-908 (1964). F12,108/64

Various stressors caused an elevation of hyaluronic acid and chondroitin sulphate in rat skin.

Ehrentheil, O. F., Reyna, L. J., Yerganian, G., Chen, E. T.: "Studies in stress glycosuria.

I. Prolonged glycosuria in Chinese hamsters after repeated stress." *Diabetes* **13**: 83-86 (1964). F1,978/64

Chinese hamsters unfamiliar with each other started fighting when placed together. This resulted in glycosuria, which continued for two weeks after daily repeated fights. Both catecholamine and corticoid discharge during the G.A.S. may be of etiologic significance. The findings could be pertinent to the development of stress-induced diabetes.

Oyama, J., Medina, R., Platt, W. T.: "Influence of age on liver glycogenesis in rats exposed to acceleration stress." *Endocrinology* **78**: 556-560 (1966). F62,885/66

"Significant increases in liver glycogen deposition occurred in centrifuged rats 18 days or older but not in younger rats. The unresponsiveness of the younger rats was attributed to their limited ability to elaborate increased amounts of adrenal corticosterone during centrifugation."

Oyama, J., Daligcon, B. C.: "Liver glycogenesis, glycogen synthetase and adrenal responsiveness of rats exposed to acceleration stress." *Endocrinology* **80**: 707-713 (1967).

F81,569/67

As indicated by changes observed after centrifugation, "increased liver glycogenesis in stressed rats was always preceded by an increase in total synthetase activity due to an increase in the G-6-P independent form of the enzyme. No increase in liver glycogenesis or synthetase activity occurred in 14-day-old rats, in rats treated with actinomycin D or Metopirone, or in adrenalectomized rats."

Buchel, L., Guyonneau, M.: "Variations du taux plasmatique des acides gras libres et de la glycémie au cours de la contrainte du Rat blanc" (Changes in the plasma level of free fatty acids and blood glucose during restraint in white rats). *C.R. Soc. Biol. (Paris)* **161**: 289-292 (1967). F85,806/67

Carey, L. C., Lowery, B. D., Cloutier, C. T.: "Blood sugar and insulin response of humans in shock." *Ann. Surg.* **172**: 342-350 (1970).

G77,785/70

Within minutes, patients in traumatic hypovolemic shock develop severe hyperglycemia, which falls gradually as resuscitation progresses, but is still high after five hours. The serum insulin is unresponsive to the hyperglycemia of shock.

Bottger, I., Falloona, G. R., Unger, R. H.: "The effect of intensive physical exercise on pancreatic glucagon secretion." *Diabetes* **20** Supp. 1: 339 (1971).

J10,799/71

In the dog and in man, blood glucagon levels rose during physical exercise, probably

contributing to the associated hyperglycemia. Blood insulin concentrations varied less regularly.

Joseph, S., Brahmachari, H. D.: "Carbohydrate metabolism under environmental stress. Part II—Glucose tolerance under heat, cold and hypoxic stress." *Indian J. Exp. Biol.* **10**: 272-273 (1972). J20,224/72

Exposure to heat, cold, or hypoxia decreases glucose tolerance in the rat, presumably as a consequence of stress.

Raichle, M. E., King, W. H.: "Functional hypoglycemia: a potential cause of unconsciousness in flight." *Aerosp. Med.* **43**: 76-78 (1972). J20,017/72

In a student pilot, functional hypoglycemia with unconsciousness developed during acceleration a few hours after a high carbohydrate meal.

Prioux-Guyonneau, M., Buchel, L.: "Métabolisme des lipides et des glucides chez le rat blanc au cours de deux agressions, immobilisation forcée et variations thermiques" (Lipid and carbohydrate metabolism in white rats in the course of 2 stresses, forced immobilization and thermal variations). *C.R. Soc. Biol. (Paris)* **166**: 1277-1283 (1972). H66,183/72

Khanna, N. K., Lauria, P., Sharma, V. N.: "Effect of electroshock stress on the glycogen and acetylcholine content of the myocardium of the dog." *Indian J. Med. Sci.* **26**: 380-382 (1972). G94,705/72

Electroshock stress produced an increase in acetylcholine and a decrease in glycogen in the myocardium of the dog.

Németh, Š., Vigaš, M., Lichardus, B.: "Indirect proofs for true metabolization of glucose disappearing from the blood of rats during trauma." *J. Trauma* **12**: 891-897 (1972). H78,475/72

In rats subjected to trauma in the Noble-Collip drum, the glucose concentration in small bowel irrigation effluents dropped, even after glucose pretreatment. In alloxan diabetic rats, the injury caused a significant decrease in blood sugar. From this and other experiments, it is concluded that true metabolic disappearance of blood glucose occurs during the first period of trauma (21 refs.).

Rahe, R. H., McHugh, W., Kaplan, N., Rimon, R., Arthur, R. J.: "Serum lactic acid variability in subjects experiencing stressful training." *Dis. Nerv. Syst.* **33**: 403-408 (1972). H79,743/72

In a U. S. Navy underwater demolition team undergoing a psychologically and physically stressful underwater training swim, serum lactic acid rose considerably. "In contrast to reports by other authors, no significant correlation was seen between subjects' serum lactic acid levels and a psychological questionnaire's indices of psychoneurotic symptomatology. A significant correlation was seen between a measure of physical fitness of the men and their serum lactic acid concentrations."

Stremmel, W.: "Die Bedeutung des Blutglykogens nach stressinduzierten Stoffwechselstörungen" (The importance of blood glycogen concentration after stress-induced metabolic disturbances). *Brunn's Beitr. Klin. Chir.* **220**: 297-305 (1973). J3,874/73

In patients the stress of surgical interventions raises blood glycogen. A similar change is seen after exposure to various stressors and may be responsible for increased platelet adhesiveness and stress-induced thrombosis.

Németh, Š., Vigaš, M.: "Hypercatabolism of glycide compounds during trauma: possible mechanisms." In: Németh, S., *Hormones, Metabolism and Stress. Recent Progress and Perspectives*, pp. 295-306. Bratislava: Slovak Academy of Sciences, 1973.

E10,477/73

In rats, trauma in the Noble-Collip drum increases the degradation of carbohydrates via the Embden-Meyerhof pathway. Much of the increased glycolysis during stress may serve for "fight or flight" necessitating muscular work. In fasted animals, the resulting hypoglycemia threatens damage to the CNS, whereas in fed rats hyperlactacidemia may be a symptom of hypoxia, and can contribute to fatal acidosis.

Heath, D. F., Corney, P. L.: "The effects of starvation, environmental temperature and injury on the rate of disposal of glucose by the rat." *Biochem. J.* **136**: 519-530 (1973).

J8,004/73

The disposal rate of intravenous glucose among rats was not very predictably influenced by exposure to various stressors such as burns, surgical trauma, fasting, cold, heat or hind-limb ischemia.

Harrison, M. H.: "Comparison of the metabolic effects of centrifugation and heat stress in man." *Aerosp. Med.* **44**: 299-303 (1973).

H80,109/73

In fasted men the stress of centrifugation

or exposure to heat increased blood lactate, glucose, FFA, glycerol and catecholamine levels, but these changes did not always parallel each other (30 refs.).

O'Hanlon, J. F., Horvath, S. M.: "Interrelationships among performance, circulating concentrations of adrenaline, noradrenaline, glucose, and the free fatty acids in men performing a monitoring task." *Psychophysiology* **10**: 251-259 (1973). J3,116/73

In young men performing an exacting vigilance test, basal blood EP and NEP were inversely related to glucose. EP initially increased during the test but later returned to its basal level in proportion to performance. NEP was not related to performance. Glucose and FFA were elevated, both during the task and throughout a control period spent watching slide projections.

White, J. A., Bolsteidge, M., Downing, H. J., et al.: "Effects of stress on the results of glucose tolerance tests performed on vervet monkeys (*Ceropithecus pygerythrus* F. Cuvier)." *J. S. Afr. Vet. Med. Assoc.* **44**: 379-381 (1973). J24,393/73

Myles, W. S., Radomski, M. W.: "Excretion of lactic acid by rats exposed to simulated high altitude." *Aerospace Med.* **45**: 422-424 (1974). J12,121/74

In rats, hypoxia, like EP injections, increased the urinary lactate level. This may furnish us with "an indicator of the severity of hypoxic stress at altitude."

Silbergeld, E. K.: "Blood glucose: a sensitive indicator of environmental stress in fish." *Bull. Environ. Contam. Toxicol.* **11**: 20-25 (1974). J9,883/74

In the freshwater fish johnny darter (*Etheostoma nigrum Rafinesque*) a rise in blood glucose is a sensitive indicator of stress (for example, handling, capture, insecticide).

Wiener, R., Spitzer, J. J.: "Glucose metabolism following severe hemorrhage in the conscious dog." *Am. J. Physiol.* **227**: 63-66 (1974). H89,534/74

Robertson, R. P., Porte, D. Jr.: "Plasma catecholamine responses to intravenous glucose in normal man." *J. Clin. Endocrinol. Metab.* **39**: 403-405 (1974). H89,331/74

In man, glucose-stimulated insulin secretion is inhibited during stress. This effect can be reversed by α -adrenergic blockade which raises insulin discharge and augments insulin responses to glucose. Presumably, endogenous

catecholamine secretion exerts an inhibitory effect upon insulin production.

Dechezleprêtre, S., Lechat, P.: "Effets comparés de l'adrénaline et d'un stress aigu sur la glycémie, la lactacidémie et la corticostérone plasmatique et surrénalienne du rat" (Comparison of the effects of epinephrine and acute stress on glycemia, lactacidemia, and the plasma and adrenal corticosterone levels in the rat). *Agressologie* **15**: 117-123 (1974). H93,830/74

In rats, acute exposure to cold causes marked hyperlactacidemia and mild hyperglycemia, with a considerable increase in plasma and adrenal corticosterone levels. These changes reach their maximum within ten minutes. EP exerts a similar effect due to the stressor action of the injection procedure, since it is also produced by injection of the solvent alone. The changes elicited by combined treatment with cold and EP are not greater than those caused by the two agents separately.

Äärimaa, M., Slätis, P., Haapaniemi, L., Jeglinsky, B.: "Glucose tolerance and insulin response during and after elective skeletal surgery." *Ann. Surg.* **179**: 926-929 (1974). J13,288/74

In patients undergoing surgery the glucose tolerance curves assumed a diabetic pattern. Insulin secretion was suppressed on the day of operation but rose above preoperative values in the postoperative period. "The hyperglycemia occurring after hemorrhage and after tissue injury is presumably a purposeful metabolic alarm reaction tending to maintain an adequate supply of fuel to the brain and peripheral nerves during stress conditions."

Giddings, A. E. B.: "The control of plasma glucose in the surgical patient." *Br. J. Surg.* **61**: 787-792 (1974). H95,487/74

On the basis of studies on surgical patients, "it is suggested that insulin resistance is an adaptive feature which permits an augmented supply of energy substrate to meet the demands of injury. In adequate amounts intravenous carbohydrate spares tissue protein and fat during recovery."

Struck, P. J., Tipton, C. M.: "Effect of acute exercise on glycogen levels in adrenalectomized rats." *Endocrinology* **95**: 1385-1391 (1974). H94,156/74

Follenius, M., Brandenberger, G.: "Influence de l'exercice musculaire sur l'évolution

de la cortisolémie et de la glycémie chez l'homme" (Effect of muscular exercise on diurnal variations of plasma cortisol and glucose in normal men). *Eur. J. Appl. Physiol.* **33**: 23-33 (1974).

J16,058/74

In man, exercise on a bicycle ergometer raises plasma cortisol within ten minutes. Blood glucose decreases at first but is elevated to the initial level twenty minutes after cessation of work.

Electrolytes, Water, Osmotic Pressure, Diuresis, pH

Acute stress, especially if conducive to shock, undoubtedly exerts a pronounced influence upon water and salt metabolism, and consequently alters osmotic pressure in blood and tissues.

In this connection, the first studies directly related to the G.A.S. revealed that in rats an alarm reaction produced by heavy formaldehyde intoxication caused hypochloremia concurrently with hemoconcentration and hypoglycemia, all of which could be inhibited by the crude cortical extracts (cortin) then available.

It has also been shown that stress caused by prolonged swimming reduces the potassium concentration in brain and muscle, and elicits many other alterations in electrolyte metabolism. However, these are not always strictly correlated with other manifestations characteristic of stress, presumably because each parameter has its own time-curve and is subject to different special conditioning influences.

Attention has been called to the fact that patients with head injuries develop hypochloremia and hypochloruria reminiscent of the drop in blood chloride produced by DOC in the rat, but the latter is unassociated with hypochloruria; hence, a close relationship between the two remains highly problematic. In any event, various stressors can elicit hypochloremia in man as well as in other mammals. The increased diuresis associated with stress in man is similar to that seen during early starvation. It can even be elicited by discussion of "stressful subjects," and is then associated with enhanced corticoid, nitrogen, sodium and potassium elimination.

A particularly interesting manifestation of stress-induced alterations in water and electrolyte metabolism is the so-called "distress edema." At times of emotional crisis, a patient may gain as much as 20 pounds in a single day, owing to fluid and electrolyte retention.

Several investigators have also examined the blood pH variations and calcium metabolism changes during stress. However, apart from the well-known hyperlactacidemia that contributes to acidosis and the loss of calcium in astronauts on long voyages (which may be more specifically related to the effect upon bones in an environment deprived of gravity), no definitely established regularities have been revealed.

Electrolytes, Water, Osmotic Pressure, Diuresis, pH

(See also our earlier stress monographs, p. xiii)

Rydin, H., Verney, E. B.: "The inhibition of water-diuresis by emotional stress and by muscular exercise." *Q. J. Exp. Physiol.* **27**: 343-374 (1938).

A14,575/38

In dogs, emotional excitement and muscular exercise inhibit diuresis. This response

is unaltered by transection of the renal nerves, by extirpation of one adrenal and denervation of the other or by decentralization of the whole abdominal sympathetic system with removal of ganglia L₂ to S₁ inclusive. The course of this inhibition is matched by intravenous vasopressin. "The post-pituitary equivalent of this stress in terms of the standard powder is of the order of 1 µg."

Selye, H., Dosne, C., Bassett, L., Whit-

taker, J.: "On the therapeutic value of adrenal cortical hormones in traumatic shock and allied conditions." *Can. Med. Assoc. J.* **43**: 1-8 (1940). A32,768/40

During the shock phase of the alarm reaction produced by heavy formaldehyde dosage in the rat, there is hypochloremia, hypoglycemia and hemoconcentration, all of which can be at least partially inhibited by a crude cortical extract (cortin). This is even more obvious in surgical shock produced by partial hepatectomy, but here a specific effect of hepatic insufficiency could not be excluded.

O'Connor, W. J., Verney, E. B.: "The effect of increased activity of the sympathetic system in the inhibition of water-diuresis by emotional stress." *Q. J. Exp. Physiol.* **33**: 77-90 (1945). 95,009/45

Hoagland, H., Stone, D.: "Brain and muscle potassium in relation to stressful activities and adrenal cortex function." *Am. J. Physiol.* **152**: 423-435 (1948) (31 refs.). B19,300/48

Hoagland, H.: "Stress and the adrenal cortex with special reference to potassium metabolism." *Psychosom. Med.* **12**: 142-148 (1950). B51,612/50

In rats, stress caused by prolonged swimming reduced the potassium concentration of the brain and muscle.

Hinkle, L. E. Jr., Wolf, S.: "Studies in diabetes mellitus: changes in glucose, ketone, and water metabolism during stress." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 338-389. Baltimore: Williams & Wilkins, 1950.

B51,913/50

During stress, polyuria may occur in both diabetic and nondiabetic persons. However, in the former a massive loss of glucose and electrolytes contributes to the development of dehydration and coma. "The life history of one diabetic person was presented; and a brief formulation of a possible meaning of diabetes mellitus as the inappropriate use of a normal adaptive mechanism to starvation because of early conditioning, and perhaps of constitutional predisposition, has been suggested" (76 refs.).

Pfeiffer, J. B. Jr., Wolff, H. G.: "Studies in renal circulation during periods of life stress and accompanying emotional reactions in subjects with and without essential hypertension; observations on the role of neural

activity in regulation of renal blood flow." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 929-953. Baltimore: Williams & Wilkins, 1950.

B51,951/50

Kuhl, W. J. Jr., Ralli, E. P.: "Effect of acute stress upon blood constituents, white cells, and urine constituents in normal individuals." *Proc. Assoc. for the Study of Internal Secretions—33rd. Meet.*, p. 51. Atlantic City, N.J., 1951. Also in: *J. Clin. Endocrinol. Metab.* **11**: 776 (1951).

B58,505/51

Normal men immersed in cold water (9.5°C) for eight minutes showed: 1—A decrease in temperature (immediate, 1 and 2 hours); 2—An increase in systolic and diastolic blood pressure (immediate) and a decrease (2 hours); 3—A decrease in heart rate (1, 2 and 4 hours); 4—An increase in neutrophiles (immediate); 5—A decrease in lymphocytes (2 hours); 6—A decrease in eosinophiles (2 hours); 7—A decrease in serum chloride (immediate); 8—An increase in total proteins (immediate and 4 hours); 9—A decrease in serum water (immediate); 10—An increase in total cholesterol (4 hours); 11—An increase in the urine uric acid/creatinine ratio (2 and 4 hours)." All of these changes were significant and ascribed to stress, but no one indicator gave uniformly positive results.

Blake, W. D.: "Effect of exercise and emotional stress on renal hemodynamics, water and sodium excretion in the dog." *Am. J. Physiol.* **165**: 149-157 (1951).

B58,156/51

In dogs, "emotional stress" associated with exercise increased the reabsorptive rate of sodium, since the excretion did not correlate with a similar change in the glomerular filtration rate.

Higgins, G., Lewin, W., O'Brien, J. R. P., Taylor, W. H.: "Metabolic disorders in head injury. Hyperchloraemia and hypochloururia." *Lancet* June 16, 1951, pp. 1295-1300.

J12,252/51

In patients with serious head injuries, hyperchloraemia with hypochloururia occurs as it does after DOC treatment. Hyperchloraemia has previously been described as characteristic of the G.A.S. in rats, but this was unassociated with hypochloururia, and hence it remains questionable whether the present clinical observations can be ascribed to stress as such.

Faurbye, A., Vestergaard, P., Kobbernagel, F., Nielsen, A.: "Adrenal cortical function in chronic schizophrenia (stress, adrenaline-test, ACTH-test)." *Acta Endocrinol.* (Kbh.) **8**: 215-246 (1951). B63,996/51

In man, EP treatment and the production of fever by injections of killed *B. faecalis* *alcaligenes* are regarded as adequate "stress tests" as indicated by the increase in uric acid and potassium excretion, as well as the hematologic changes that result.

Hinkle, L. E. Jr., Edwards, C. J., Wolf, S.: "The occurrence of diuresis in humans in stressful situations and its possible relation to the diuresis of early starvation." *J. Clin. Invest.* **30**: 809-817 (1951) (35 refs.).

D12,861/61

Prioreschi, P., Gabbiani, G.: "Action of various damaging agents on myocardial potassium." *Can. J. Physiol. Pharmacol.* **42**: 763-767 (1964). G19,432/64

Some stressors increase the potassium content of the rat myocardium while others do not.

Valtin, H., Schroeder, H. A.: "Familial hypothalamic diabetes insipidus in rats (Brattleboro strain)." *Am. J. Physiol.* **206**: 425-430 (1964). F1,711/64

In rats with familial hypothalamic diabetes insipidus, which can be corrected by vasopressin, the ability to concentrate urine in response to stress, dehydration, hypertonic saline or nicotine is greatly impeded.

Maniey, J.: "Aggressions et hypokaliémie chez le rat. II. Rôle de l'hypophyse et de la surrénales dans l'hypokaliémie provoquée par une agression non spécifique" (Stress and hypokalemia in the rat. II. Role of the hypophysis and adrenals in the hypokalemia induced by nonspecific stress). *J. Physiol. (Paris)* **57**: 447-456 (1965). G34,801/65

Weltman, A. S., Sackler, A. M.: "Timidity and metabolic elimination patterns in audiogenic-seizure susceptible and resistant female rats." *Experientia* **22**: 627-629 (1966). G16,051/66

There is a positive relationship between timidity and seizure susceptibility in rats exposed to "auditory stress." At the same time, there is an increase in diuresis and the quantity of feces.

Robert, A., Phillips, J. P., Nezamis, J. E.: "Production, by restraint, of gastric ulcers and of hydrothorax in the rat." *Gastroenterology* **51**: 75-81 (1966). G40,473/66

In rats, restraint produced gastric ulcers and hydrothorax within four to six hours. Overnight fasting prevented the hydrothorax and reduced the gastric ulcerations (contrary to previous reports). Restraint ulcers and hy-

drothorax "were also inhibited by crowding of the animals, a rise in ambient temperature, or administration of prednisolone."

Zlody, R. L.: "Changes in three blood components as a result of a stress situation." *Psychosomatics* **7**: 14-18 (1966).

F61,990/66

In male graduate students, a stressful examination causes a shift of the blood acid base level in the alkaline direction, an increase in red cell count and leukocytosis (21 refs.).

Paré, W. P., McCarthy, T. E.: "Urinary sodium and potassium and prolonged environmental stress." *J. Genet. Psychol.* **108**: 135-142 (1966). J21,567/66

Rats exposed to stressors (sound, electroshock) "manifest a significant eosinopenia and adrenal hypertrophy. Estimates of Na and K during the stress period do not manifest a shift in electrolyte balance for stress animals. The authors conclude that the adrenal mineralocorticoids do not participate in the physiological response to chronic environmental stress."

Gordon, R. S. Jr., Andrews, H. L.: "Potassium depletion under heat stress." *Fed. Proc.* **25**: 1372-1374 (1966). F69,424/66

Malm, J. R., Manger, W. M., Sullivan, S. F., Papper, E. M., Nahas, G. G.: "The effect of acidosis on sympatho-adrenal stimulation. Particular reference to cardiopulmonary bypass." *J.A.M.A.* **197**: 121-125 (1966).

F67,945/66

Acidosis accompanying hemorrhagic shock, apneic oxygenation and retransfusion of stored blood is associated with a rise in catecholamine production and plays a decisive role in cardiopulmonary bypass operations. "Control of arterial pH is of prime importance in modifying the sympatho-adrenal stress response of extracorporeal circulation."

Maniey, J.: "Influence des agressions sur la teneur en potassium et en sodium du plasma chez la ratte gestante ou non gestante et chez le foetus" (Influence of stresses on plasma potassium and sodium levels in the pregnant and nonpregnant rat and in the fetus). *Ann. Endocrinol. (Paris)* **28** Suppl.: 63 (1967). H61,543/67

Pospíšil, M.: "Oscillations of urine electrolyte excretion in mice and its significance for evaluating interindividual differences in the reaction to stress." *Physiol. Bohemoslov.* **16**: 172-177 (1967). G48,158/67

Gairard, A., Marnay-Gulat, C., Raoul, Y.: "Essai d'analyse de la contrainte ulcérogène du Rat par l'étude de l'élimination urinaire de divers ions" (Experimental analysis of restraint ulcerogenesis in the rat by study of the urinary elimination of various ions). *C.R. Soc. Biol. (Paris)* **161**: 2132-2136 (1967).

F98,979/67

In rats, restraint ulcers are associated with a decrease in creatinine, chlorine, sodium and calcium excretion. Phosphaturia is increased, whereas potassium elimination does not change.

Power, L.: "Distress edema." *Postgrad. Med.* **42**: 14-18 (1967).

G48,510/67

In a female patient, "weight fluctuations and edema were found to be a response to emotional stress and family tension. At times of emotional crisis the patient was capable of gaining as much as 20 lb in a single day." Probably, many cases of so-called "idiopathic edema" are due to stress.

J23,751/68

Kay, R. G.: "The effect of an aldosterone antagonist upon the electrolyte response to surgical trauma." *Br. J. Surg.* **55**: 266-272 (1968).

F97,873/68

In patients following surgical interventions, there is diminished urinary excretion of sodium and early postpotassium-diuresis. These changes are not much influenced by the aldosterone antagonist SC-11927. The finding "obviously challenges the accepted role of aldosterone in post-traumatic sodium metabolism and an alternative explanation must be sought for the diminished urinary excretion of sodium observed at this time." Literature is cited to show that the characteristic post-traumatic electrolyte changes are also present in adrenalectomized patients on constant corticoid intake.

J22,932/69

In man, the stress of exhaustive muscular exercise causes an increase in aldosterone and potassium excretion as well as sodium retention, followed by a decrease in aldosterone and potassium elimination, which in turn initiates a rebound phenomenon. This cyclicity must be taken into account in evaluating pertinent information.

Majle, T.: "Studies on the influence of stress factors, external irradiation and selected pharmacologic agents on the retention of radioactive caesium ^{137}Cs in rat body."

Roczn. Zak. Hig. (Warsz.) **21**: 497-508 (1970) (Polish). H64,378/70

Kaffarnik, H., Gross, W., Dawid, E., Deibert, K., Juchems, R.: "Verhalten der Adenylatkinase (Myokinase), des Adenosintriphosphats (ATP) und der K- und Na-Ionen im Serum bzw. Blut unter standardisierter körperlicher Belastung" (Behavior of adenylate kinase [myokinase], adenosine triphosphate [ATP] and K and Na ions in the serum or blood under standardized physical stress). *Z. Gesamte Exp. Med.* **153**: 324-330 (1970). H36,724/70

In man, muscular work increases the serum concentration of adenylate kinase and ATP, but does not change potassium or sodium levels. "The results are discussed with respect to the turnover of the phosphates during physical stress" (25 refs.).

Hadynoń, B.: "Influence of stress on potassium and calcium content of the myocardium in guinea pigs." *Pathol. Pol.* **22**: 633-639 (1971) (Polish). J20,494/71

Flynn, A., Pories, W. J., Strain, W. H., Hill, O. A. Jr.: "Mineral element correlation with adrenohypophyseal-adrenal cortex function and stress." *Science* **173**: 1035-1036 (1971). H44,997/71

In rats stressed by hemorrhage, "serum calcium, copper, and magnesium demonstrated little correlation with ACTH changes. The strong ACTH-zinc correlation points to an as yet undefined interaction between ACTH and zinc."

Classen, H.-G., Marquardt, P., Späth, M., Schumacher, K.-A.: "Hypermagnesemia following exposure to acute stress." *Pharmacology (Basel)* **5**: 287-294 (1971).

H44,498/71

In the cat, the "hypermagnesemia produced by withdrawal of blood, asphyxia, infusions of catecholamines or poisoning with potassium cannot be prevented by reserpine, phentolamine or Kö 592."

Sevy, S.: "Acute emotional stress and sodium in breast milk." *Am. J. Dis. Child.* **122**: 459 (1971). J20,192/71

Viru, A., Körge, P.: "Metabolic processes and adrenocortical activity during marathon races." *Int. Z. Angew. Physiol.* **29**: 173-183 (1971). G84,664/71

Among fourteen first-class marathon runners, all but the two best showed lowering of blood cortisol levels during the race. Urinary sodium decreased and potassium increased.

In most cases, GPT activity and NPN rose in plasma, and the excretion of nitrogen and creatinine was reduced. "It was suggested that before the end of the marathon race the protein catabolism is diminished due to a decrease of the glucocorticoid function of the adrenal gland."

Rothschild, H. C., Shaw, S. M.: "Urinary sodium-potassium ratio determination by tracer methodology for the detection of stress caused by noise." *Environ. Lett.* **1**: 277-285 (1971). J11,082/71

In rats, sound causes a marked depletion of adrenal ascorbic acid associated with significant alterations of sodium/potassium ratios in the urine. The sodium/potassium ratio "should prove valuable in the identification of various environmental stimuli as possible stressors."

Newton, W. M.: "An evaluation of the effects of various degrees of long-term confinement on adult beagle dogs." *Lab. Anim. Sci.* **22**: 860-864 (1972). H79,341/72

In adult beagles confined to cages for long periods, no evidence of musculoskeletal rearrangement of calcium metabolism could be detected.

Sabbot, I. M., McNew, J. J., Hoshizaki, T., Sedgwick, C. J., Adey, W. R.: "Effect of a 30 day isolation stress on calcium, phosphorus and other excretory products in an unrestrained chimpanzee." *Aerosp. Med.* **43**: 142-148 (1972). H73,921/72

Observations on chimpanzees kept in isolation for thirty days suggest that "the calcium to phosphorus excretion ratio might serve as a physiological stress indicator of Selye's adaptation syndrome (period of resistance)."

Wessels, F., Losse, H.: "Untersuchungen des Natriumtransports und -gehaltes der Erythrozyten unter Stresseinwirkung" (Studies on the sodium transport and content of erythrocytes under the effects of stress). *Med. Welt (Stuttg.)* **23**: 1394-1395 (1972). H60,857/72

Wegner, T. N., Ray, D. E., Lox, C. D., Stott, G. H.: "Effect of stress on serum zinc and plasma corticoids in dairy cattle." *J. Dairy Sci.* **56**: 748-752 (1973).

J19,913/73

In cattle, various stressors produced inconsistent changes in serum zinc, which were not clearly related to the plasma corticoid levels.

Umminger, B. L., Gist, D. H.: "Effects of thermal acclimation on physiological responses to handling stress, cortisol and aldosterone injections in the goldfish, *Carassius auratus*." *Comp. Biochem. Physiol. [A]* **44**: 967-977 (1973). H64,677/73

"Goldfish subjected to stressful handling and sham injection procedures responded with a hyperglycemia and a decline in serum chloride and sodium concentrations. Carcass water content was not affected."

Németh, S., Vigaš, M.: "Hypercatabolism of glycidic compounds during trauma: possible mechanisms." In: Németh, Š., *Hormones, Metabolism and Stress. Recent Progress and Perspectives*, pp. 295-306. Bratislava: Slovak Academy of Sciences, 1973. E10,477/73

In rats, trauma in the Noble-Collip drum increases the degradation of carbohydrates via the Embden-Meyerhof pathway. Much of the increased glycolysis during stress may serve for "fight or flight" necessitating muscular work. In fasted animals, the resulting hypoglycemia threatens damage to the CNS, whereas in fed rats hyperlactacidemia may be a symptom of hypoxia and can contribute to fatal acidosis.

Smith, D. F.: "The effect of exercise and pain-stress on the renal clearance of lithium, sodium, potassium and creatinine in the rat." *Int. Pharmacopsychiatry* **8**: 217-220 (1973).

J9,657/73

Forced exercise increases the renal lithium clearance in rats but fails to alter sodium and potassium excretion. Pain stress does not affect electrolyte elimination. "The possibility of a decreased lithium clearance during strenuous exercise in psychiatric patients taking lithium is discussed."

Mullane, J. F., Wilfong, R. G., Phelps, T. O., Fischer, R. P.: "Metabolic acidosis, stress and gastric lesions in the rat." *Arch. Surg.* **107**: 456-459 (1973). J5,966/73

In rats the acidosis induced by restraint and ingestion of ammonium chloride was compared with that in patients with renal failure. "These studies suggest that metabolic acidosis may account in part for gastric lesions associated with renal failure."

Sobocinska, J.: "The effect of prolonged immobilization on diuresis and water intake

in rats." *Space Life Sci.* **4**: 200-203 (1973). H79,375/73

In rats immobilized in their natural position for many weeks, there was an increase in diuresis but no change in sodium or potassium excretion.

Avioli, L. V.: "The therapeutic approach to hypoparathyroidism." *Am. J. Med.* **57**: 34-42 (1974). J13,992/74

Review of the literature on the effects of stressors, particularly emotional arousal, upon calcium metabolism (103 refs.).

Enzymes

Countless investigations have dealt with enzymatic changes characteristic of stress, but often the techniques used have not been sufficiently well described to permit any definitive interpretation. Hence, in order to promote research along these lines, we have to limit ourselves to a classification of the data as reported by the authors, merely reproducing their own conclusions in the abstract section. Thus the reader will at least be provided with a classified index of data on the enzyme systems studied, which will enable him to consult the abstracts (and, if necessary, the original publications) cited under each heading.

Review articles, as well as those dealing conjointly with many enzymatic activities in the blood or in certain tissues, are discussed under Generalities. The same is true of publications concerned with poorly characterized or very rarely examined enzymes that do not require separate sections.

However, the following are recognized as special categories and are arranged alphabetically in the abstract sections:

Amylase

ATPase and related enzymes

Catecholamine synthetases

Decarboxylases (e.g., histidine and ornithine decarboxylases)

Dehydrogenases (e.g., succinic dehydrogenase, lactate dehydrogenase)

Esterases (e.g., cholinesterase, arylesterases)

Glucuronidase

Hyaluronidase

Hydroxylases (e.g., dopamine- β -hydroxylase, tyrosine hydroxylase, tryptophan hydroxylase, cholesterol-7 α -hydroxylase)

Lipases, including "clearing factor lipase" and other lipoprotein lipases

Lysozyme

Monoamine oxidase (MAO)

Methyl transferases (e.g., phenylethanolamine-N-methyl transferase)

Oxidases, peroxidases and oxygenases (except MAO which, because of its importance in stress, has been dealt with in a separate section)

Phosphatases

Phosphokinases (e.g., creatine phosphokinase)

Plasmin and fibrinolysin (see also Blood Coagulation under Functional Changes)

Transaminases (e.g., GOT, GPT, tyrosine aminotransferase)

Tryptophan pyrolase

Uropepsin and pepsinogen

Drug-metabolizing enzymes. Because they partly overlap with previously mentioned groups, these are discussed separately in the final part of this section. They play an especially important role in stress by inactivating endogenous or exogenous toxicants, as a consequence of hepatic microsomal activity.

Enzymes

(See also our earlier stress monographs, p. xiii)

Generalities. Knox, W. E., Auerbach, V. H., Lin, E. C. C.: "Enzymatic and metabolic adaptations in animals." *Physiol. Rev.* **36**: 164-254 (1956). E83,471/56

Excellent review of the literature on enzymatic adaptations to the most diverse stimuli, including sections on the regulation of these adaptations by hormones and the nervous system (752 refs.).

Knox, W. E.: "Adaptive enzymes in animals." In: Mongar, J. L. and de Reuck, A. V. S., *Ciba Foundation Symposium on Enzymes and Drug Action*, pp. 245-275. London: J and A Churchill, 1962. G51,969/62

Review on adaptive enzyme production with special reference to the stimulating effect of glucocorticoids. Stress as such receives no detailed attention, but it is noted that a great variety of agents can increase the activity of certain hepatic enzymes. "The recognition of the adrenal hormone-induced adaptation of the tryptophan pyrrolase has provided the unified explanation for a large number of different stressful stimuli which increase the enzyme level."

Rosen, F., Nichol, C. A.: "Corticosteroids and enzyme activity." *Vitam. Horm.* **21**: 135-214 (1963). E3,837/63

Review based mainly on observations concerning glucocorticoid-induced alterations in hepatic enzymes. It is postulated that "the ability of man or animals to respond to stress depends essentially on changes in the activity of particular enzymes in peripheral tissues and in the liver. Such changes in metabolism are selective and are of importance in relation to survival when the stress is severe" (several hundred refs.).

Beard, E. L., Hampton, J. K. Jr.: "Effect of trauma on rat serum proteolytic activity." *Am. J. Physiol.* **204**: 405-407 (1963). D58,955/63

Belenkii, M. L., Bliuger, A. F., Shuster, I. I.: "Changes in the activity of some blood

serum enzymes during the action of strong stimuli on the body." *Biull. Èksp. Biol. Med.* **55** No. 5: 67-69 (1963) (Russian).

G57,360/63

Review of blood enzyme changes during the G.A.S.

Jonek, J., Stanosek, J., Krauze, M., Wacławczyk, H.: "Histochemische Untersuchungen über das Verhalten einiger Enzyme in Nebennieren bei Meerschweinchen nach chronischer Lärmeinwirkung" (Histochemical examinations of various enzymes in the adrenals of guinea pigs after chronic exposure to noise). *Z. Mikrosk. Anat. Forsch.* **73**: 174-186 (1965). G38,514/65

In guinea pigs, chronic exposure to noise (kind not clearly described) produced characteristic histochemical changes in various enzyme activities which gradually tended to disappear. These changes were ascribed to the alarm and resistance stages of the G.A.S.

Wegman, H. M., Brüner, H., Jovy, D., Klein, K. E.: "Änderung von Enzymaktivitäten im Serum als Ausdruck unspezifischer Anpassung" (Plasma enzyme changes as a result of nonspecific adaptation). *D.V.L.* No. **431**: 11-17 (1965). F61,311/65

Brief report on plasma enzyme changes under the influence of hypoxia and other stressors.

Wegman, H. M., Klein, K. E., Brüner, H.: "Die Auswirkung fliegerischer Belastung auf einige Blutkomponenten" (Effects of flying stress on certain components of the blood). *Int. Z. Angew. Physiol.* **23**: 293-304 (1967). G45,957/67

Among the indicators examined in jet pilots training for Starfighter F-104 G flights, corticoids and certain enzyme activities in the blood proved most sensitive to stress, whereas other enzyme and blood sugar variations were unreliable (24 refs.).

Rasmussen, R. A., Rasmussen, L. E.: "Some observations on the protein and enzyme levels and fractions in normal and stressed elasmobranchs." *Trans. N.Y. Acad. Sci.* **29**: 397-413 (1967). J10,798/67

In various elasmobranchs, stressors (mus-

cular fatigue, hypoxia, confinement, osmotic and temperature shock) produced serum and brain enzyme changes interpreted as characteristic of stress.

Reddy, M. V. V., Kastenschmidt, L. L., Cassens, R. G., Briskey, E. J.: "Studies on stress-susceptibility: the relationship between serum enzyme changes and the degree of stress-susceptibility." *Life Sci. [II]* **10**: 1381-1391 (1971). *G88,453/71*

Stress-susceptible pigs exhibit a particularly pronounced increase in certain plasma enzymes when exposed to various stressors.

Tollersrud, S., Baustad, B., Flatlandsmo, K.: "Effects of physical stress on serum enzymes and other blood constituents in sheep." *Acta Vet. Scand.* **12**: 220-229 (1971) (Norwegian). *J20,894/71*

Raby, C.: "Enzymes et agressions" (Enzymes and stresses). *Cah. Anesth.* **20**: 131-145 (1972). *J20,133/72*

C11,324/54

Bondarenko, I. I.: "The role of the adrenal glands in changes in the activity of blood serum cholinesterase in stress reactions caused by surgical trauma." *Patol. Fiziol. Éksp. Ter.* **11** Nos. 11-12: 70-71 (1967) (Russian). *J22,291/67*

Augustinsson, K. B., Henricson, B.: "Stress-induced alterations in arylesterase activity in the rat." *Biochim. Pharmacol.* **18**: 21-27 (1969). *G64,142/69*

In rats, emotional stress enhances plasma arylesterase activity, whereas muscular work has an inverse effect. The EP-induced increase in arylesterase activity is inhibited by ACTH.

Litvak, E. A.: "Cholinesterase activity in fatal cases of traumatic shock, craniocerebral injuries and stress." *Sud. Med. Ekspert.* **12** No. 2: 7-10 (1969) (Russian).

J24,150/69

Cholinesterase determinations in rabbits and rats under stress revealed a "considerable decrease of enzyme activity in the cortical regions of the large hemispheres, anterior and posterior hypothalamic parts, in the medulla oblongata and in the liver. . . . Immobilisatory stress proved that the enzymatic reaction is not specific but depends on the amount of the inflicted trauma."

Yordanova, L., Gotsev, T.: "Alterations in the enzyme activity of students with increased body temperature during examinations." *J. Physiol. (Paris)* **63**: 463-464 (1971). *J20,215/71*

Among students under "examination stress," the most outstanding objective changes were tachycardia, hypertension, dilatation of the pupils, increased intraocular

pressure, sweating, alterations in erythrocytes and platelets, a rise in body temperature and in the blood levels of carbonic anhydrase and cholinesterase.

Glucuronidase. Kendler, J., Harry, E. G.: "Systemic Escherichia coli infection as a physiological stress in chickens." *Res. Vet. Sci.* **8**: 212-218 (1967). J23,505/67

Coli-septicemia caused a characteristic stress syndrome with involution of the spleen and bursa, associated with increased bursal β -glucuronidase.

Hyaluronidase. Clay, M. M., Sinai, C. R.: "Stress effects on hyaluronidase activity." *J. Pharm. Sci.* **54**: 469-470 (1965).

F33,493/65

In rats, various stressors decreased the hyaluronidase spreading activity in the skin. Forced swimming did, whereas cold did not, cause adrenal hypertrophy.

Clay, M. M., Adler, M. W.: "Alterations in hyaluronidase activity and serum protein electrophoretic patterns after chronic heat stress." *J. Pharm. Sci.* **56**: 756-767 (1967).

F80,259/67

Hydroxylases. Akopian, I. I.: "Effect of some factors on the formation of induced enzymes involved in tyrosine oxidation in liver tissue." *Biokhimiia* **28**: 643-646 (1963) (Russian).

J24,999/63

Thoenen, H.: "Induction of tyrosine hydroxylase in peripheral and central adrenergic neurones by cold-exposure of rats." *Nature* **228**: 861-862 (1970). H32,295/70

Weinshilboum, R. M., Kvetňanský, R., Axelrod, J., Kopin, I. J.: "Elevation of serum dopamine- β -hydroxylase activity with forced immobilization." *Nature [New Biol.]* **230**: 287-288 (1971). J20,891/71

Restraint increases serum dopamine- β -hydroxylase activity in rats, even after adrenalectomy or adrenal demedullation. This is probably an index of elevated sympathetic nerve activity.

Kvetňanský, R., Weise, V. K., Gewirtz, G. P., Kopin, I. J.: "Synthesis of adrenal catecholamines in rats during and after immobilization stress." *Endocrinology* **89**: 46-49 (1971). H43,006/71

Immobilization is known to augment tyrosine hydroxylase in rat adrenals. It could now be shown that "the increased levels of enzymes result in enhanced synthesis of

epinephrine- ^{14}C from tyrosine- ^{14}C but not from dopa- ^3H . During immobilization, conversion of tyrosine- ^{14}C to catecholamines is further increased and may exceed the capacity of even the elevated levels of dopamine- β -hydroxylase to convert dopamine to norepinephrine."

Kvetňanský, R., Kopin, I. J.: "Activity of adrenal catecholamine-producing enzymes and their regulation after stress." *Adv. Exp. Med. Biol.* **33**: 517-533 (1972).

J23,807/72

Observations on rats suggest that tyrosine hydroxylase activity increases in the adrenals during stress. This response is "most probably mediated by a direct effect of ACTH on the adrenal medulla or by an unknown factor (not cyclic-AMP) released from the adrenal cortex following ACTH administration" (37 refs.).

Cantfort, J. van: "Influence du 'stress' sur l'activité de la cholestérol-7 α -hydroxylase" (Effect of stress on cholesterol-7 α -hydroxylase activity). *C.R. Acad. Sci. (Paris)* **277**: 345-348 (1973). J6,396/73

In normal animals the cholesterol-7 α -hydroxylase activity of the liver shows a circadian rhythm with a maximum at the beginning of the night. This is controlled by the hypothalamus-pituitary-adrenal axis and is abolished by adrenalectomy. Corticoids and various stressors increase the activity of the enzyme in the rat.

Thoenen, H., Otten, U., Oesch, F.: "Transsynaptic regulation of tyrosine hydroxylase." In: Usdin, E., *Frontiers in Catecholamine Research*, pp. 217-218. London: Pergamon Press, 1973. J16,138/73

Immediately after swimming stress, the cAMP content of the adrenal is not increased.

Otten, U., Oesch, F., Thoenen, H.: "Dissociation between changes in cyclic AMP and subsequent induction of TH in the rat superior cervical ganglion and adrenal medulla." *Naunyn Schmiedebergs Arch. Pharmacol.* **280**: 129-140 (1973). J9,378/73

In rats, various stressors (cold, swimming) cause changes in the cAMP and tyrosine hydroxylase activities of the superior cervical ganglion and adrenal medulla. Their significance in the production of stress reactions is not clear.

Leon, A. S., Thomas, P. E., Sernatinger, E., Canlas, A.: "Serum dopamine beta-hy-

droxylase activity as an index of sympathetic activity." *J. Clin. Pharmacol.* **14**: 354-362 (1974). H87,422/74

In rats and in man, elevation of dopamine β -hydroxylase activity is a less reliable indicator of stress than is measurement of circulating catecholamines.

Hoeldtke, R., Lloyd, T., Kaufman, S.: "An immunochemical study of the induction of tyrosine hydroxylase in the rat adrenal." *Biochem. Biophys. Res. Commun.* **57**: 1045-1053 (1974). J12,349/74

"Tyrosine hydroxylase-specific protein is increased in rat adrenal medulla by immobilization stress, cold exposure and 6-hydroxydopamine administration."

Lamprecht, F., Eichelman, B. S., Williams, R. B., Wooten, G. F., Kopin, I. J.: "Serum dopamine-beta-hydroxylase (DBH) activity and blood pressure response of rat strains to shock-induced fighting." *Psychosom. Med.* **36**: 298-303 (1974). J19,160/74

In rats, electroshock-induced fighting is associated with increased sympathetic nerve activity, reflected in serum dopamine- β -hydroxylase activity. The levels of this enzyme are "a useful index of sympathetic nerve function in that they are related to hemodynamic responses to stress."

Ogihara, T., Nugent, C. A.: "Serum DBH in three forms of acute stress." *Life Sci.* **15**: 923-930 (1974). J17,673/74

In man, various stressors cause no consistent changes in serum dopamine- β -hydroxylase. Hence, this enzyme is not a reliable indicator of stress.

Azmitia, E. C. Jr., McEwen, B. S.: "Adrenocortical influence on rat brain tryptophan hydroxylase activity." *Brain Res. (Amst.)* **78**: 291-302 (1974). J16,012/74

Naftchi, N. E., Wooten, G. F., Lowman, E. W., Axelrod, J.: "Relationship between serum dopamine- β -hydroxylase activity, catecholamine metabolism, and hemodynamic changes during paroxysmal hypertension in quadriplegia." *Circ. Res.* **35**: 850-861 (1974). H97,485/74

Observations on patients "indicate that hypertension in quadriplegia, whether spontaneous or induced, is caused by increased release of norepinephrine and that the half-life of dopamine- β -hydroxylase released during stress is shorter than that previously reported."

Chuang, D. M., Costa, E.: "Biosynthesis

of tyrosine hydroxylase in rat adrenal medulla after exposure to cold." *Proc. Natl. Acad. Sci. U.S.A.* **71**: 4570-4574 (1974) (22 refs.). J18,863/74

Goodwin, P. M., Harrop, J., Marks, V.: "Dopamine-beta-hydroxylase and sympathoadrenal activity." *Lancet* January 18, 1975, pp. 170-171. H97,468/75

In man, during various stress tests that considerably raised plasma catecholamines, plasma dopamine- β -hydroxylase levels did not prove to be a good indicator of sympathetic nervous activity.

Lipases and "Clearing factor." Seifter, J., Baeder, D. H.: "Lipemia clearing by hyaluronidase, hyaluronate and desoxycorticosterone, and its inhibition by cortisone, stress and nephrosis." *Proc. Soc. Exp. Biol. Med.* **86**: 709-713 (1954). B98,156/54

Observations in rats suggest that the "release of a lipemia clearing inhibitor appears to be another manifestation of the general adaptation syndrome."

Povoa, H. Jr., Callado, A. N. A., Pereira, J. M., Coutinho, J. M.: "Stress and clearing factor lipase in rat adipose tissue." *Acta Biol. Med. Ger.* **21**: 125-126 (1968).

H2,269/68

Following formalin- or cold-induced stress, the clearing factor lipase activity of adipose tissue decreases in the rat.

Ham, J. M., Slack, W. W.: "Lipoprotein lipase activity in patients before and after minor surgical operations." *Clin. Chim. Acta* **25**: 417-422 (1969). J22,519/69

The mean rise in lipoprotein lipase (clearing factor lipase) in the plasma of patients given a standard dose of heparin is diminished on the second day following surgical operations.

Tayeau, F., Jouzier, E., Tixier, M.: "II. Isolement et étude 'in vitro' d'un inhibiteur naturel du facteur clarifiant" (II. Isolation and "in vitro" study of a natural inhibitor of the clearing factor). *Bordeaux Méd.* **3**: 1999-2008 (1970). H32,022/70

Tayeau, F., Jouzier, E., Tixier, M.: "III. Action 'in vivo' de l'inhibiteur du facteur clarifiant" (III. "In vivo" action of the inhibitor of the clearing factor). *Bordeaux Méd.* **3**: 2011-2014 (1970). H32,023/70

Observations on man and various experimental animals have shown that the mucoprotein that appears in the blood and urine

during stress (physical effort, intoxications, infections, serious diseases and so on) constitutes a natural inhibitor of the lipoprotein lipase or "clearing factor" (22 refs.).

Bondarenko, M. F.: "The activity of lipoprotein lipase of the cardiac muscle in experimental diabetes in association with stress." *Probl. Endokrinol.* **16** Nos. 3-4: 92-95 (1970) (Russian). J23,974/70

Borbola, J., Gecse, A., Karady, S.: "The activity of lipoprotein lipase in rat heart after tourniquet stress." *Adv. Exp. Med. Biol.* **33**: 387-393 (1972). J23,805/72

Oehler, G., Wolf, H., Schmahl, F. W., Róka, L.: "Veränderungen der Lipoproteinkinase nach experimenteller Femurfraktur" (Changes in lipoprotein-lipase after experimental fracture of the femur). *Res. Exp. Med.* **163**: 31-38 (1974). H87,841/74

In rabbits, fracture of the femur caused a significant decrease in heparin-insoluble lipoprotein-lipase with a concurrent increase in serum glycerides and in the excretion of catecholamines during the first twenty-four hours. There was also histologic evidence of pulmonary fat embolism. It is concluded that "in addition to the increased synthesis of triglycerides during the post-traumatic phase (lipid mobilization syndrome) the elimination of blood lipids is impaired by decreased LPL activity. The elevated release of catecholamine is probably of essential significance for both effects."

Lysozyme. Luca, R. de, Caruso, P.: "Modificazioni del lisozima serico e della properdina dopo elettroshock" (Modifications of the serum lysozyme and properdin content after electroshock). *First Symp. Internaz. Lisozima*, April, 1959, pp. 3-5. Milan, 1959. D16,164/59

In five patients, the serum properdin values rose during the first two hours following electroshock and then returned to normal, whereas the lysozyme concentration increased up to twenty-four hours and longer.

MAO (Monoamine oxidase). Eleftheriou, B. E., Boehlke, K. W.: "Brain monoamine oxidase in mice after exposure to aggression and defeat." *Science* **155**: 1693-1694 (1967). F78,184/67

Shimmyo, T.: "Effects of stress on MAO activity in the brain and the ocular tissues of

rabbits." *Folia Ophthalmol. Jap.* **18**: 312-314 (1967). J24,622/67

Almeida, P. A. M., Kulay, L. Jr., Camano, L.: "Histochemical study of the monoamine oxidase (MAO) in the placenta of rats (*Rattus norvegicus albinus*, Rodentia mammalia) which were submitted to acute stress on the 15th and 18th days of pregnancy." *Ann. Histochem.* **16**: 265-272 (1971). G88,359/71

Maura, G., Vaccari, A., Gemignani, A., Cugurra, F.: "Development of monoamine oxidase activity after chronic environmental stress in the rat." *Environ. Physiol. Biochem.* **4**: 64-79 (1974). J13,612/74

In rats exposed to various stressors (auditory stimulation, flashing lights, cage oscillations), MAO activity was measured in the liver, brain, heart, stomach, adrenals and platelets. "The acute environmental stress was ineffective in all organs; chronic stress, however, caused variations in the enzyme activity in all organs, chiefly the heart, in both male and female rats. Liver, brain and cardiac MAO appeared to be more sensitive to stresses, as they were reduced by a shorter exposure than was required in the other organs studied. The environmental stress did not change significantly adrenal and platelet MAO. The variations appeared within the first 10 days after the termination of the stress period. This early effect may suggest an alteration of MAO turnover. The effects of chronic stress are reversible as there was an almost complete recovery of MAO activity one month after the stress."

Makarova, L. V., Bazarevich, G. I., Likhentshtein, A. O.: "Role played by the serotonin-monoaminoxidase system in the changes of functional condition of the adrenal cortex in traumatic shock." *Probl. Endokrinol.* **20** No. 5: 72-74 (1974) (Russian). H95,572/74

In dogs, stress induced by traumatic shock produces characteristic changes in 5-HT-MAO activity which are related to the secretion of corticoids.

Maura, G., Vaccari, A.: "Relationships between age of submission to environmental stress, and monoamine oxidase activity in rats." *Experientia* **31**: 191-193 (1975). K398/75

Young rats exposed to various stressors exhibit a drop in cerebral and hepatic MAO activity.

Mitro, A., Szetei, F., Kvetňanský, R.: "Stress-induced changes of monoamine oxidase activity (MAO) in different areas of the rat hypothalamus" (abstracted). *Physiol. Bohemoslov.* **24:** 71-72 (1975).

J22,935/75

Methyl transferases. Kvetňanský, R., Weise, V. K., Kopin, I. J.: "Elevation of adrenal tyrosine hydroxylase and phenylethanolamine-N-methyl transferase by repeated immobilization of rats." *Endocrinology* **87:** 744-749 (1970).

H30,287/70

Ciarenallo, R. D., Dornbusch, J. N., Barchas, J. D.: "Rapid increase of phenylethanolamine N-methyltransferase by environmental stress in an inbred mouse strain." *Science* **175:** 789-790 (1972).

H51,460/72

Zachariasen, R. D., Newcomer, W. S.: "Phenylethanolamine-N-methyl transferase activity in the avian adrenal following immobilization or adrenocorticotropin." *Gen. Comp. Endocrinol.* **23:** 193-198 (1974).

H88,608/74

In cockerels, ACTH or immobilization resulted in an increase in plasma EP and NEP with an accompanying decrease in the adrenal levels of these catecholamines; plasma corticosterone also rose as did the phenylethanolamine-N-methyl transferase (PNMT) content of the adrenals without affecting adrenal corticosterone. "It is suggested that the rapid increase in PNMT activity, occurring with the acute application of stressors in chickens, may provide a means of sustaining an increased outflow of EP in times of 'stress'." Corticosterone may play a role in the elevation of PNMT during the avian stress response.

Oxidases, Peroxidases, Oxygenases (except MAO). Maffei-Faccioli, A., Mortari, A., Ornesi, A., Scamazzo, T.: "Comportamento della triptofano perossidasi ossidasi epatica nel ratto in varie condizioni stressanti" (Behavior of hepatic tryptophan peroxidase oxidases in the rat in various stressful conditions). *Boll. Soc. Ital. Biol. Sper.* **37:** 1258-1261 (1961).

J22,944/61

Dewhurst, F.: "The effect of stress upon the metabolism of 2-naphthylamine in mice." *Experientia* **19:** 646-647 (1963).

E37,601/63

In mice, exposure to cold or noise accelerates the metabolism of 2-naphthylamine, pre-

sumably owing to activation of microsomal oxidases by the stressors.

Billewicz-Stankiewicz, J., Szczekala, Z.: "Studies on adrenaline oxidase of the blood plasma. III. Effect of stress on adrenaline oxidase activity." *Acta Physiol. Pol.* **16:** 695-699 (1965) (Polish). F59,654/65

Yuwiler, A., Geller, E.: "Rat liver tryptophan oxygenase induced by neonatal corticoid administration and its effect on brain serotonin." *Enzyme* **15:** 161-168 (1973).

J11,698/73

A single injection of cortisol in newborn rats prematurely induces tryptophan oxygenase in the liver, "with a concomitant reduction in serotonin concentration in the thalamic-hypothalamic and pontine areas of the brain. The ability of tryptophan to behave as a metabolic regulator may be important in the organism's response to stress."

Francesconi, R. P., Mager, M.: "Cold exposure: effect on hepatic tryptophan oxygenase and tyrosine aminotransferase, plasma tryptophan and tyrosine, and brain monoamines." *Experientia* **30:** 233-235 (1974).

H86,502/74

In mice, exposure to "cold stress" rapidly enhances the production of tryptophan oxygenase and tyrosine aminotransferase. However, "there are no general correlations between increased activity of these catabolic enzymes and reduced levels of plasma tryptophan, tyrosine and brain norepinephrine and serotonin. . . Our results indicate that if the rate limiting enzymes in serotonin and norepinephrine biosynthesis, tryptophan and tyrosine hydroxylases respectively, are stimulated by cold stress, then homeostatic conditions are maintained by increased levels of catabolic activity."

Phosphatases. Feustel, G., Pieper, K. S., Hübner, H. J., Lappa, H.: "Histochemische Untersuchung zum Verhalten der sauren Phosphatase in Schilddrüse, Nebennierenrinde, Adenohypophyse und hypothalamischen neurosekretorischen Kernen von Albinoratten nach lang dauernder körperlicher Belastung unter normalem und verminderter Sauerstoffpartialdruck" (Histochemical study on the behavior of acid phosphatase in the thyroid gland, adrenal cortex, adenohypophysis and hypothalamic neurosecretory nuclei of albino rats after long-term physical stress under normal and diminished partial pressure of oxygen). *Acta Histochem. (Jena)* **34:** 317-333 (1969). H21,129/69

Börnig, H., Horn, A., Müller, W.: "Zum Mechanismus der Aktivitätsänderung der alkalischen Phosphatase in Leber und Darm der Ratte nach Ligatur des Ductus choledochus" (Alkaline phosphatase changes in liver and intestine caused by choledochus ligation in the rat). *Acta Biol. Med. Ger.* **22**: 537-549 (1969). H15,664/69

In rats, choledochus ligation, laparotomy and other stressors increase hepatic alkaline phosphatase activity. This is not inhibited by adrenalectomy or by the effective steroid hormone, cortisol.

Choudhury, S. R., Lundy, A. M.: "Studies of acid phosphatase and nonspecific esterase activities in rat adrenal glands following operative stress." *J. Histochem. Cytochem.* **18**: 650-659 (1970). G78,540/70

Boyne, R., Fell, B. F.: "Observations on the alkaline phosphatase content of the neutrophil granulocytes of some laboratory and farm animals, with particular reference to the effects of intensive management and reproduction." *Res. Vet. Sci.* **13**: 347-355 (1972). J19,597/72

Alkaline phosphatase activity in circulating polymorphonuclears was raised "under relatively mild conditions of stress in cattle, pigs and rats. Marked increases occurred in association with pregnancy in pigs, sheep and rabbits." The effect is presumably caused by enhanced corticoid secretion.

Clermont, H. G., Williams, J. S., Adams, J. T.: "Steroid effect on the release of the lysosomal enzyme acid phosphatase in shock." *Ann. Surg.* **179**: 917-921 (1974).

J13,287/74

In dogs, various forms of shock and especially that elicited by endotoxin raised the serum acid phosphatase level but this change could be largely inhibited by glucocorticoids and prolonged survival. "Whether this salutary effect is due solely to the ability of steroids to stabilize cellular membranes or is in part secondary to promoting improved tissue hemodynamics could not be established."

Phosphokinases. Meltzer, H. Y.: "Plasma creatine phosphokinase activity, hypothermia, and stress." *Am. J. Physiol.* **221**: 896-901 (1971). H47,238/71

In rats, exposure to cold greatly increases plasma creatine phosphokinase activity, presumably as part of the stress reaction, although other stressors are less effective.

Adrenalectomy does not prevent this response.

Meltzer, H. Y., Holzman, P. S., Hassan, S. Z., Guschwan, A.: "Effects of phenacyclidine and stress on plasma creatine phosphokinase (CPK) and aldolase activities in man." *Psychopharmacologia* (Berlin) **26**: 44-53 (1972). G92,837/72

Meltzer, H. Y.: "Effects of phenacyclidine and restraint at 2°C on rat plasma creatine phosphokinase activity." *Res. Commun. Chem. Pathol. Pharmacol.* **5**: 117-127 (1973). H64,159/73

Misner, J. E., Massey, B. H., Williams, B. T.: "The effect of physical training on the response of serum enzymes to exercise stress." *Med. Sci. Sports* **5**: 86-88 (1973).

J11,491/73

In man, running increases the serum creatine phosphokinase and glutamic oxalacetic transaminase concentrations (17 refs.).

Blumöhr, T., Klöcking, R., Sprössig, M.: "Veränderungen der Plasmakreatinkinaseaktivität durch Coxsackievirusinfektion bei Mäusen" (Coxsackie virus infection causing plasma creatine kinase changes in mice). *Pathol. Microbiol.* (Basel) **40**: 241-250 (1974). H89,273/74

In mice, swimming (allegedly owing to its stressor effect) predisposes to Coxsackie virus infection and raises plasma creatine kinase activity. Causal connections between these changes are suspected but not proven.

Loegering, D. J.: "Effect of swimming and treadmill exercise on plasma enzyme levels in rats." *Proc. Soc. Exp. Biol. Med.* **147**: 177-180 (1974). H95,533/74

Swimming or treadmill exercise in the rat resulted in elevations of the plasma levels of aspartate aminotransferase, creatine phosphokinase and lactate dehydrogenase. These changes were ascribed to stress.

Plasmin and fibrinolysin. Beard, E. L., Carroll, G. F., Danos, G. T.: "Release of plasminogen activator from rat liver lysosomes induced by stress related enzymes." *Proc. Soc. Exp. Biol. Med.* **131**: 438-442 (1969). H14,082/69

Beard, E. L., Busuttil, R. W., Gottshalk, S. K.: "Stress induced release of plasminogen activator from lysosomes." *Thromb. Diath. Haemorrh.* **21**: 20-25 (1969).

H9,860/69

Engquist, A., Winther, O.: "Variations of plasma cortisol and blood fibrinolytic activity during anaesthetic and surgical stress." *Br. J. Anaesth.* **44**: 1291-1297 (1972). J672/72

In man, during thirty to ninety-three minutes of "surgical stress, enhancement of fibrinolysis was significantly correlated with an increase of plasma cortisol levels."

Teshima, H., Inoue, S., Ago, Y., Ikemi, Y.: "Plasminic activity and emotional stress." *Psychother. Psychosom.* **23**: 218-228 (1974).

J16,685/74

Angioneurotic or Quincke's edema often occurs immediately after psychogenic stress. This may be related to the increased plasmin activity found in animals following exposure to various stressors or EP.

Transaminases. Mandel, M. J., Robinson, F. R., Luce, E. A.: "SGOT levels in man and the monkey following physical and emotional exertion." *Aerosp. Med.* **33**: 1216-1223 (1962).

J23,454/62

In man, no clearcut relationship was found between SGOT and vibration, heat or static acceleration. "The marked lability of the SGOT levels in the monkey remains unexplained; however, the possibility of a less discrete mechanism for 'stress' may be responsible for the monkey values" (46 refs.).

Bliuger, A. F., Belenkii, M. L., Shuster, I. I.: "On the mechanism of increase in some blood serum enzymes activity under the influence of strong stressors." *Vopr. Med. Khim.* **10** No. 1: 12-15 (1964) (Russian).

G59,822/64

Geller, E., Yuwiler, A., Schapiro, S.: "Comparative effects of a stress and cortisol upon some enzymic activities." *Biochim. Biophys. Acta* **93**: 311-315 (1964).

G22,722/64

In rats, "although the activities of liver tyrosine- α -ketoglutarate transaminase (EC 2.6.1.5), tryptophan- α -ketoglutarate transaminase and tryptophan pyrolase (EC 1.11.1.4) are elevated by injection of cortisol, no such activation could be observed following imposition of a stress demonstrably effective in causing adrenal cortical hormone secretion." This apparent paradox might be due to differences in plasma cortisol levels.

Schapiro, S., Yuwiler, A., Geller, E.: "Stress-activated inhibition of the cortisol effect on hepatic transaminase." *Life Sci.* **3**: 1221-1226 (1964).

G21,848/64

Schapiro, S., Yuwiler, A., Geller, E.: "Maturation of a stress-activated mechanism inhibiting induction of tyrosine transaminase." *Science* **152**: 1642-1643 (1966).

F67,277/66

Matsubara, Y., Tahara, K., Kogure, T., et al.: "Effect of electroshock on serum transaminase (GOT, GPT) in rabbits." *J. Tokyo Med. Coll.* **24**: 513-521 (1966).

J23,776/66

Pearl, W., Balazs, T., Buyske, D. A.: "The effect of stress on serum transaminase activity in the rat." *Life Sci.* **5**: 67-74 (1966).

G36,694/66

"Myocardial damage was produced in rats by isoproterenol without elevating serum glutamic-oxalacetic transaminase or serum glutamic-pyruvic transaminase. However, restraint was followed by an increase in both of these enzymes without gross myocardial injury, while adrenalectomy suppressed this elevation. Neither ACTH nor corticosterone replacement elicited the enzyme response. Epinephrine induced a marked rise in serum transaminase, and this effect was potentiated by corticosterone."

Berry, L. J., Agarwal, M. K., Snyder, I. S.: "Comparative effect of endotoxin and reticuloendothelial 'blocking' colloids on selected inducible liver enzymes." In: Luzio, N. R. di and Paoletti, R., *The Reticuloendothelial System and Atherosclerosis*, pp. 266-274. New York: Plenum Press, 1967.

E7,069/67

In mice, stress induced by endotoxin lowers the activity of tryptophan pyrolase and increases that of tyrosine- α -ketoglutarate transaminase in the liver. Presumably, such enzyme responses are characteristic of stress.

Viru, A., Körge, P.: "Metabolic processes and adrenocortical activity during marathon races." *Int. Z. Angew. Physiol.* **29**: 173-183 (1971).

G84,664/71

Among fourteen first-class marathon runners, all but the two best showed lowering of blood cortisol levels during the race. Urinary sodium decreased and potassium increased. In most cases, GPT activity and NPN rose in plasma, and excretion of nitrogen and creatinine was reduced. "It was suggested that before the end of the marathon race the protein catabolism is diminished due to a decrease of the glucocorticoid function of the adrenal gland."

Chatterjee, A. K., Dighe, S. K., Naithani, R. C., Ghose, A., Balkrishna: "The role of

methylamphetamine on plasma transaminase level under altitude stress." *Jap. J. Pharmacol.* **22**: 871-873 (1972). H65,788/72

Chatterjee, A. K., Dighe, S. K., Naithani, R. C., Sachan, A. S., Krishna, B.: "The role of DL-dihydroxy phenyl alanine (DOPA) on plasma transaminase level under altitude stress." *Jap. J. Pharmacol.* **23**: 269-271 (1973). H85,774/73

A rise in plasma and tissue transaminase is considered to be characteristic of stress in the rat. These observations would indicate that DOPA is not a particularly effective "antistress drug."

Misner, J. E., Massey, B. H., Williams, B. T.: "The effect of physical training on the response of serum enzymes to exercise stress." *Med. Sci. Sports* **5**: 86-88 (1973). J11,491/73

In man, running increases the serum creatine phosphokinase and glutamic oxalacetic transaminase concentrations (17 refs.).

Németh, Š., Straková, A., Vigaš, M.: "The role played by adrenal hormones in the increase of liver tyrosine aminotransferase activity of rats subjected to trauma." *Horm. Metab. Res.* **5**: 204-207 (1973).

H71,682/73

Németh, Š., Vigaš, M., Straková, A.: "Time and level of increased plasma corticosterone necessary for induction of liver tyrosine aminotransferase in rats subjected to trauma." *Horm. Metab. Res.* **5**: 283-285 (1973). H74,982/73

Namboodiri, M. A. A., Ramasarma, T.: "Mechanism of induction of tyrosine aminotransferase during cold exposure." *Environ. Physiol. Biochem.* **3**: 255-262 (1973).

J11,453/73

Stefan, M., Gheorghe, N., Boerescu, J.: "L'activité de l'aminotransférase de la tyrosine dans diverses conditions de stress" (Tyrosine aminotransferase activity in various stress conditions). *Rev. Roum. Physiol.* **11**: 299-304 (1974). J16,281/74

In rats, various stressors (restraint, burns, noise, x-irradiation, hypoxia, hypothermia, ether, chloroform) increase the tyrosine aminotransferase activity of the liver, both in the presence and after extirpation of the adrenal. The effect is comparable to that produced by cortisol. "It is concluded that induction of tyrosine aminotransferase is characteristic of the alarm reaction in the rat."

Németh, Š., Juráni, M.: "Hepatic tyrosine aminotransferase (TAT) in stressed trouts and rats." *Gen. Comp. Endocrinol.* **22**: 388 (1974). H83,271/74

In trout living under crowded conditions and in rats traumatized by the Noble-Collip drum, plasma cortisol increased, but hepatic tyrosine aminotransferase activity was elevated only in the rats. This agrees with previous observations suggesting that the enzyme response is not observable in vertebrates below the evolutionary level of amphibians.

Loegering, D. J.: "Effect of swimming and treadmill exercise on plasma enzyme levels in rats." *Proc. Soc. Exp. Biol. Med.* **147**: 177-180 (1974). H95,533/74

Swimming or treadmill exercise in the rat resulted in elevations of the plasma levels of aspartate aminotransferase, creatine phosphokinase, and lactate dehydrogenase. These changes were ascribed to stress.

Tryptophan pyrolase. Knox, W. E.: "Adaptive enzymes in animals." In: Mongar, J. L. and de Reuck, A. V. S., *Ciba Foundation Symposium on Enzymes and Drug Action*, pp. 245-275. London: J and A Churchill, 1962. G51,969/62

Review on adaptive enzyme production with special reference to the stimulating effect of glucocorticoids. Stress as such receives no detailed attention, but it is noted that a great variety of agents can increase the activity of certain hepatic enzymes. "The recognition of the adrenal hormone-induced adaptation of the tryptophan pyrolase has provided the unified explanation for a large number of different stressful stimuli which increase the enzyme level."

Geller, E., Yuwiler, A., Schapiro, S.: "Comparative effects of a stress and cortisol upon some enzymic activities." *Biochim. Biophys. Acta* **93**: 311-315 (1964). G22,722/64

In rats, "although the activities of liver tyrosine- α -ketoglutarate transaminase (EC 2.6.1.5), tryptophan- α -ketoglutarate transaminase and tryptophan pyrolase (EC 1.11.1.4) are elevated by injection of cortisol, no such activation could be observed following imposition of a stress demonstrably effective in causing adrenal cortical hormone secretion." This apparent paradox might be due to differences in plasma cortisol levels.

Nomura, J.: "Effect of stress and psycho-

tropic drugs on rat liver tryptophan pyrrolase." *Endocrinology* **76**: 1190-1194 (1965).

F41,304/65

Various stressors and chlorpromazine increase tryptophan pyrrolase activity in the rat liver. Hypophysectomy does, whereas adrenalectomy does not, prevent this effect.

Berry, L. J., Agarwal, M. K., Snyder, I. S.: "Comparative effect of endotoxin and reticuloendothelial 'blocking' colloids on selected inducible liver enzymes." In: Luzio, N. R. di and Paoletti, R., *The Reticuloendothelial System and Atherosclerosis*, pp. 266-274. New York: Plenum Press, 1967.

E7,069/67

In mice, stress induced by endotoxin lowers the activity of tryptophan pyrrolase and increases that of tyrosine- α -ketoglutarate transaminase in the liver. Presumably, such enzyme responses are characteristic of stress.

Cabibbe, F., Paracchi, G., Lanzara, D.: "Azione di alcuni psicofarmaci sulla triptofano-pirrolasi epatica di ratti in stato di stress post-operatorio" (Action of some psychopharmacologic agents on hepatic tryptophan pyrrolase in rats during postoperative stress). *Boll. Soc. Ital. Biol. Sper.* **43**: 1183-1186 (1967).

G52,346/67

Nisticò, G., Preziosi, P.: "Brain and liver tryptophan pathways and adrenocortical activation during restraint stress." *Pharmacol. Res. Commun.* **1**: 363-368 (1969).

G80,145/69

In rats, the increase in plasma corticosterone produced by restraint is associated with a rise in tryptophan pyrrolase and a fall in brain 5-HT, which are not correlated with the duration of the stress. The decrease in 5-HIAA during the first hour is followed by a progressive increase. Apparently, during stress "the tryptophan shunt from the serotonin to the kynurenine pathway is almost abolished."

Golotin, V. G., Berdyshev, G. D., Brekhman, I. I.: "The activity of tryptophan pyrrolase in rat liver in health and in stress." *Vopr. Med. Khim.* **15** No. 1: 16-21 (1969) (Russian).

J15,869/69

In both intact and adrenalectomized rats, the tryptophan pyrrolase activity of the liver is increased by cortisol and the stress of restraint. Adrenalectomy in itself has a similar effect. Obviously, this enzyme system must be regulated during stress not only through corticoids, but also through extra-adrenal mechanisms (27 refs.).

Sitaramam, V., Ramasarma, T.: "Nature of induction of tryptophan pyrrolase in cold exposure." *J. Appl. Physiol.* **38**: 245-249 (1975).

J21,676/75

Exposure to cold increased the hepatic tryptophan pyrrolase of the rat presumably through the mediation of corticoids. "The changes in the enzyme obtained under cold stress with respect to the overshoot phenomenon, relationship to the degree of stress and reversibility on withdrawal from the stress indicate the 'adaptate' nature of the response."

Green, A. R., Curzon, G.: "Effects of hydrocortisone and immobilization on tryptophan metabolism in brain and liver of rats of different ages." *Biochem. Pharmacol.* **24**: 713-716 (1975).

H99,235/75

In rats, restraint or cortisol increased hepatic tryptophan pyrrolase activity and (in certain age groups) 5-HT and 5-HIAA concentrations in the brain.

Uropepsin and Pepsinogen. Gray, S. J., Ramsey, C., Reifenstein, R. W., Benson, J. A. Jr.: "The significance of hormonal factors in the pathogenesis of peptic ulcer." *Gastroenterology* **25**: 156-172 (1953).

B89,103/53

In man, ACTH and cortisone enhanced the basal nocturnal gastric hydrochloric acid and pepsin secretion with a concomitant increase in uropepsin elimination. Similar changes were seen during stress, but vagotomy and anticholinergic agents "do not appear to alter the gastric acid, pepsin and urinary uropepsin response to adrenal stimulation or stress.... Although the gastric response to stress is undoubtedly mediated through the vagus nerve, there appears to be an additional hormonal mechanism which is intimately associated with the adrenal gland and the general adaptation syndrome."

Gray, S. J., Ramsey, C. G., Reifenstein, R. W.: "Clinical use of the urinary uropepsin determination in medicine and surgery." *N. Engl. J. Med.* **251**: 835-843 (1954).

C1,309/54

Extensive studies in man "support the concept that acute and chronic stress stimulates the stomach and increases uropepsin excretion by way of a humoral mechanism involving the hypothalamic-pituitary-adrenal-gastric axis that is independent of the vagus nerve or the gastric antrum" (25 refs.).

Hill, S. R. Jr., Goetz, F. C., Fox, H. M.,

Murawski, B. J., Krakauer, L. J., Reifenstein, R. W., Gray, S. J., Reddy, W. J., Hedberg, S. E., St. Marc, J. R., Thorn, C. W.: "Studies on adrenocortical and psychological response to stress in man." *Arch. Intern. Med.* **97**: 269-298 (1956).

C35,720/56

The intense muscular and psychogenic stressor effect of crew racing caused eosinopenia with increased urinary elimination of 17-OHCS, 17-KS and uropepsin, but signs of adrenal hyperactivity were also obvious during the prerace tension. In earlier studies, it was found that eosinopenia developed in both the coxswain and coach during the race; hence "the physical exertion of rowing was not the only stress involved capable of inducing a marked eosinopenia."

Hunter, C. G.: "Uropepsinogen and uoreninogen; the estimation of adrenal cortical function in stress situations." *J. R. Nav. Med. Serv.* **42**: 13-22 (1956). C16,926/56

Siruala, M., Railo, J. E.: "Stress and stomach. The effect of various traumatic lesions upon uropepsin excretion and blood eosinophils." *Acta Med. Scand.* **166**: 43-50 (1960). J23,562/60

Mason, J. W., Brady, J. V., Polish, E., Bauer, J. A., Robinson, J. A., Rose, R. M., Taylor, E. D.: "Patterns of corticosteroid and pepsinogen change related to emotional stress in the monkey." *Science* **133**: 1596-1598 (1961). D4,949/61

In rhesus monkeys, conditioned avoidance sessions of seventy-two hours caused an increase in the 17-OHCS levels, and an initial drop followed by a prolonged, marked elevation in the pepsinogen concentration of the plasma.

Pahk, S. K.: "Studies on uropepsin. II. The effect of stress upon uropepsin excretion." *J. Korea Med. Assoc.* **5**: 47-58 (1962). J23,798/62

Simler, M., Schwartz, J.: "Effets de la contrainte sur l'élimination de l'uropepsine et les stéroïdes urinaires d'origine cortico-surrénaliennes chez le rat" (The effects of restraint on the elimination of uropepsin and the urinary steroids of adrenocortical origin in the rat). *Rev. Fr. Etudes Clin. Biol.* **7**: 962-966 (1962). Also in: *C.R. Soc. Biol. (Paris)* **156**: 494-498 (1962). D47,630/62

In rats, uropepsin excretion remains normal or drops during restraint, despite increased corticoid production.

Colehour, J. K., Graybiel, A.: "Excretion of 17-hydroxycorticosteroids, catecholamines, and uropepsin in the urine of normal persons and deaf subjects with bilateral vestibular defects following acrobatic flight stress." *Aerosp. Med.* **35**: 370-373 (1964).

G11,705/64

In subjects on acrobatic flights causing increases in 17-OHCS and catecholamine excretion, uropepsin values remained unchanged.

Kuttner, R. E., Mailander, J. C.: "Serum pepsinogen in migrant Mexicans and stressed Caucasians." *J. Nat'l. Med. Assoc.* **57**: 109-111 (1965).

G28,384/65

Serum pepsinogen values are higher in Mexican men than in Caucasians. "This difference did not appear to be due to migrancy and its unsettling influences. A study of a presumably stressed female Caucasian population showed no influence on pepsin secretion. It was concluded that the Indian racial element in the Mexican sample was the responsible factor behind the pepsinogen elevation."

Eigelsreiter, H.: "Zur Uropepsin-Ausscheidung nach sportlichen Anstrengungen" (Uropepsin excretion after athletic exertion). *Forsch. Forscher Tiroler Ärzteschule* **6**: 163-184 (1966).

G63,751/66

In athletes, uropepsin excretion is increased during the alarm reaction and decreased in the stage of exhaustion of the G.A.S.

Eigelsreiter, H., Schmid, H., Spielberger, M., Teichmann, W.: "Die Uropepsin-Ausscheidung bei hydrotherapeutischen Kuren (ohne und mit gleichzeitiger Bewegungstherapie)" (Uropepsin excretion during balneotherapy with and without simultaneous kinesiatrics). *Z. Angew. Bader- u. Klimather.* **15**: 58-71 (1968).

G58,525/68

Uropepsin elimination increases during balneotherapy possibly as a consequence of stimulation by corticoids produced under the stress of adaptation to this treatment. [The data do not lend themselves well to statistical evaluation (H.S.).]

Kitamura, R.: "On the influence of Kendo training or home study upon uropepsin excretion." *Jap. Arch. Intern. Med.* **15**: 55-60 (1968).

J24,355/68

Groza, P., Buzoianu, V., Ionescu, S., Bogatu, D.: "Uropepsinogen reaction in surgical stress in terms of age." *Rev. Roum. Physiol.* **6**: 203-206 (1969). H18,402/69

In elderly patients, operative stress causes a fall in uropepsinuria that is not obvious in younger subjects. "Uropepsin assay may represent a functional test for post-traumatic reactivity."

Lozinskii, V. S.: "Significance of uropepsin determination in pilots." *Voen. Med. Zh.* **10** No. 10: 65-66 (1970) (Russian).

J22,749/70

Komorowska, A.: "Evaluation of stress conditions after dental surgery by the uropepsin test." *Czas. Stomatol.* **24**: 1163-1170 (1971) (Polish).

J20,890/71

In patients, even minor dental interventions cause an increase in uropepsin excretion within three hours, which persists for four days. The change is regarded as characteristic of the alarm reaction.

Drug-Metabolizing Enzymes. Rupe, B. D., Bousquet, W. F., Miya, T. S.: "Stress modification of drug response." *Science* **141**: 1186-1187 (1963).

E26,910/63

In rats, tourniquet stress decreases the toxicity of various drugs that can be metabolized by hepatic enzymes. "The effect of stress on drug response is not noted with barbital, a compound which is not metabolized; this effect is inhibited by treatment of the animal with a drug metabolism inhibitor such as SKF 525-A." Similar actions are obtained with ACTH or corticosterone. "Compounds which can stimulate adrenocorticotropic hormone secretion or act directly on the adrenals to produce corticosteroids should thus be able to stimulate their own metabolism or that of other drugs."

Bousquet, W. F., Rupe, B. D., Miya, T. S.: "Endocrine modification of drug responses in the rat." *J. Pharmacol. Exp. Ther.* **147**: 376-379 (1965).

F35,073/65

In rats, the duration of the response to hexobarbital, pentobarbital, meprobamate and zoxazolamine was significantly reduced as a consequence of tourniquet stress. ACTH or corticosterone simulated these stress effects. "It is suggested that the pituitary-adrenal axis serves a regulatory function with respect to duration of drug responses which may be mediated by an alteration of drug metabolism."

Driever, C. W., Bousquet, W. F.: "Stress-drug interactions: evidence for rapid enzyme induction." *Life Sci.* **4**: 1449-1454 (1965).

G31,872/65

In rats, "the ability of stress situations to

stimulate drug metabolism and its dependence upon an intact pituitary-adrenal axis is suggestive of a regulatory function of the endocrine system in mediating a rapid induction of liver microsomal enzymes responsible for drug metabolism."

Driever, C. W., Bousquet, W. F., Miya, T. S.: "Stress stimulation of drug metabolism in the rat." *Int. J. Neuropharmacol.* **5**: 199-205 (1966).

F73,812/66

In rats, stress (tourniquet) accelerated the blood clearance of hexobarbital, pentobarbital and meprobamate but not that of phenobarbital; however, this occurred only in the presence of an intact pituitary-adrenal system. "The response could be stimulated in adrenalectomized animals by corticosterone, but not by ACTH, and in hypophysectomized animals by both corticosterone and ACTH."

Lee, N. H., Hospador, M. A., Manthei, R. W.: "Influence of age and dietary stress on hexobarbital activity in mice." *Proc. Soc. Exp. Biol. Med.* **125**: 153-156 (1967).

F80,166/67

On an 8 percent casein diet, mice can still synthesize drug-metabolizing enzymes despite rapid growth. However, hexobarbital sleeping time is prolonged, perhaps because of a less active TPNH generating system.

Stitzel, R. E., Furner, R. L.: "Stress-induced alterations in microsomal drug metabolism in the rat." *Biochem. Pharmacol.* **16**: 1489-1494 (1967).

G48,920/67

"Stress (cold) caused increases in the rate of p-hydroxylation of aniline, N-dealkylation of ethylmorphine, and increases in adrenal ascorbic acid content. The stimulatory actions of stress on microsomal metabolism and ascorbic acid levels are additive with those produced by phenobarbital. It is tentatively concluded that stress and phenobarbital appear to act through different mechanisms in inducing increases in enzyme activity, although each treatment may have a common final step, namely an increased net synthesis of enzyme protein."

"Effect of nutrition and stress upon the metabolism of some barbiturate anesthetics." *Nutr. Rev.* **25**: 51-53 (1967).

Buchel, L., Prioux-Guyonneau, M., Liblau, L., Murawsky, M.: "Influence de la contrainte du rat blanc sur l'activité, la pénétration et le métabolisme de l'hexobarbital et du barbital" (Influence of restraint on the activity, penetration and metabolism of hexobarbital and barbital in white rats). *Thérapie* **27**: 609-625 (1972).

G92,849/72

"The potentiation of the hypnotic effects, increase of the sleeping time with hexobarbital, shortening of the latent period with barbital, in relation with short or long-lasting restraint in rats, are attributable to two different mechanisms: inhibition of hexobarbital metabolism; increase of barbital penetration into the brain."

Gayathri, A. K., Rao, M. R. S., Padmanabhan, G.: "Drug metabolism in cold-exposed animals." *Indian J. Biochem. Biophys.* **10**: 31-33 (1973).

J24,134/73

"Cold exposure (5-7°) of rats and mice for a week results in a significant increase in the levels of cytochrome P-450 and aniline hydroxylase activity in liver microsomes. There is no change in the activities of β -aminolaevulinate synthetase and aminopyrine demethylase. It is held that the availability of haem is not a rate-limiting step for the increased formation of cytochrome P-450 in cold-exposed animals."

Buchel, L., Murawsky, M.: "Métabolisme et activité de la zoxazolamine chez le rat blanc au cours de l'immobilisation forcée accompagnée ou non d'hypothermie" (Zoxazolamine metabolism and activity in white rats during restraint with or without hypothermia). *Arch. Sci. Physiol. (Paris)* **27**: 37-53 (1973).

J7,077/73

In rats the muscle-relaxing effect of zoxazolamine is considerably enhanced by the stress of restraint, especially in cold surroundings. This is ascribed mainly to increased sensitivity of the nervous system, and to a lesser extent, to impaired zoxazolamine metabolism during stress.

Varia

Among other biochemical alterations that have been related to stress, the most important are changes in vitamin C, cAMP, creatinine and uric acid, hippuric acid, glutathione, DNA and RNA, as well as in the equilibrium between anabolic and catabolic responses, which largely determine body weight.

Vitamin C. One of the most characteristic consequences of exposure to acute stress is the loss of ascorbic acid from the adrenal cortex. This has been confirmed in man and in many other species. It is even employed as a standard stress test, particularly in connection with the verification of the functional efficiency of the hypothalamus-hypophysis-adrenocortical system. After hypophysectomy, stress no longer exerts this effect, but ACTH remains active, indicating that the stimulus travels to the adrenals and is mediated by ACTH through the hypophysis. Since this discharge of adrenal ascorbic acid runs roughly parallel to that of the corticoids, it represents a fairly reliable indicator of the latter; however, the biochemical relationship between ascorbic acid depletion and corticoid production is not yet clearly understood.

Following treatment with ACTH, the ascorbic acid depletion of the adrenal is associated with an increase in the concentration of this vitamin within the adrenal venous blood, but curiously, under stress, more ascorbic acid disappears from the cortex than can be found in its venous effluent.

Allegedly, adrenal cannulation raises the circulating ascorbic acid level, even after hypophysectomy and exclusion of the adrenal from the circulation. Hence, part of the ascorbic acid must have an extra-adrenal origin. This conclusion is supported by the loss of ascorbic acid from various tissues of the body and its greatly increased urinary elimination during stress.

Many independent studies have shown that animal species differ greatly in their ascorbic acid discharge from the adrenals and other tissues in the course of the alarm reaction. There is no strict correlation between adrenal cholesterol and asorbic acid release, although in general the two phenomena tend to coincide.

Unlike most other species, *Tupaia* exposed to various stressors show an increase in adrenocortical ascorbic acid content.

Varia

Vitamin C. Sayers, G., Sayers, M. A., Liang, T. Y., Long, C. N. H.: "The cholesterol and ascorbic acid content of the adrenal, liver, brain and plasma following hemorrhage." *Endocrinology* 37: 96-110 (1945).

B512/45

In rats, severe hemorrhage decreases the cholesterol and ascorbic acid content of the adrenals, presumably as a consequence of its stressor effect. Hypophysectomy prevents these changes, whereas they are duplicated by ACTH. The cholesterol content of the

liver and brain is unaffected by nonfatal hemorrhage, and plasma cholesterol falls during shock due to severe hemorrhage. Hepatic and plasma ascorbic acid levels rise after mild and fall after fatal hemorrhage. Brain ascorbic acid levels are unaffected.

C25,043/56

In rats, one week of exposure to mild restraint increased the ascorbic acid, and to a lesser extent, the cholesterol content of the adrenals. Restraint sufficiently severe to reduce body temperature produced inverse changes. Loss of cholesterol and ascorbic acid from the adrenals was particularly marked in animals restrained while exposed to cold.

Briggs, F. N., Toepel, W.: "The effect of ACTH on the ascorbic acid concentration of adrenal venous plasma of the rat." *Endocrinology* **62**: 24-29 (1958). C48,344/58

The ascorbic acid concentration of adrenal venous blood was increased by laparotomy in intact rats, and by ACTH in hypophysectomized rats. "Under the influence of ACTH, the amount of ascorbic acid found in adrenal venous blood could account for that which disappeared from the adrenal, but under 'stress' more ascorbic acid disappeared from the adrenal than could be found in the adrenal venous blood." Curiously, adrenal cannulation raised the circulating ascorbic acid level even after hypophysectomy and exclusion of the adrenal from the circulation. This ascorbic acid must have been of extra-adrenal origin.

Elton, R. L., Zarrow, I. G., Zarrow, M. X.: "Depletion of adrenal ascorbic acid and cholesterol: a comparative study." *Endocrinology* **65**: 152-157 (1959). C71,402/59

"Exposure to severe cold produced significant depression of adrenal ascorbic acid in opossums and dogs, but failed to do so in frogs, toads, chickens, mice, hamsters, rab-

bits, and cats. ACTH failed to produce such a depletion in frogs, toads, chickens, rabbits, cats, or dogs; significant depressions were observed in opossums, mice and hamsters. Adrenal cholesterol concentrations remained unchanged in most species tested, however, increases were observed in rabbits, following cold exposure, and in frogs, following ACTH treatment" (24 refs.).

C80,679/60

In cats, unilateral adrenalectomy causes a depletion in the ascorbic acid content of the remaining adrenal. This response can be blocked by cortisol, the blockade in turn being overcome by ACTH injection. Compensatory hypertrophy after unilateral adrenalectomy is not as obvious in the cat as in other species.

Lahiri, S., Lloyd, B. B.: "The effect of stress and corticotrophin on the concentrations of vitamin C in blood and tissues of the rat." *Biochem. J.* **84**: 478-483 (1962). D35,013/62

In rats, exposure to a variety of sounds (gongs, horns, loud speakers, bells, vibrators) caused roughly parallel decreases in blood eosinophil and ascorbic acid concentrations in the adrenal and other tissues. On the other hand, chronic audiogenic stress led to an increase in adrenal weight, ascorbic acid concentrations and serum cholesterol.

Sanchez, C., Miya, T. S., Bousquet, W. F.: "Effects of conditioning upon stress responses in the rat." *Proc. Soc. Exp. Biol. Med.* **123**: 615-618 (1966). F73,973/66

Pretreatment of rats with small amounts of intravenous sodium chloride for five days inhibited the marked elevation of plasma corticosterone induced by saline in unpretreated controls. Similar pretreatment offered no protection, however, against the more pronounced stressor effect of intravenous histamine. The resting plasma corticosterone and ascorbic acid levels did not show any

consistent seasonal variations, and there was no manifest relationship between the two values. This "suggests that caution be employed in relying upon adrenal ascorbic acid determinations as an index of adrenocortical activity or response to stressors."

Stitzel, R. E., Furner, R. L.: "Stress-induced alterations in microsomal drug metabolism in the rat." *Biochem. Pharmacol.* **16**: 1489-1494 (1967). G48,920/67

It is incidentally noted that exposure to cold raises adrenal ascorbic acid concentrations concurrently with an increase in adrenal weight and thymus atrophy. [The authors do not discuss the fact that most investigators consider a fall in adrenal ascorbic acid as characteristic of stress (H.S.).]

Nebentierengewicht, Ascorbinsäure und Glucocorticoids im Blut bei kurzem und andauerndem soziopsychischem Stress" (The function of the adrenals in male Tupaia belangeri. Adrenal weight, ascorbic acid and glucocorticoids in the blood after acute and prolonged psychosocial stress). *J. Comp. Physiol.* **78**: 289-306 (1972). G93,303/72

Male *Tupaias*, after being defeated by a trained fighter, were separated from him by a wire mesh so that they could continually see the victor without being attacked. The fight was repeated every one to two days. Under these conditions the defeated *Tupaias* died in less than twenty days owing to the "psychosocial stress" associated with adrenal enlargement and increased ascorbic acid concentration. Plasma glucocorticoid levels initially dropped and then rose above normal. An elevation of adrenal ascorbic acid also occurred in *Tupaias* exposed to various other stressors, in contrast to the characteristic depletion in most other species.

Litwornia, B. L., Brush, M. K.: "The effect of stress on the intestinal transport of ascorbic acid in the guinea pig and on the ascorbic acid concentration of various organs." *Fed. Proc.* **33**: 673 (1974). H84,512/74

Willis, R. J., Kratzing, C. C.: "Pulmonary ascorbic acid loss induced by catecholamines." *Biochem. Pharmacol.* **23**: 2705-2711 (1974). H93,874/74

In mice, both "hyperbaric stress" and NEP decreased the vitamin C content of the lung. Following treatment with NEP, EP and some of their derivatives, both the loss of lung ascorbic acid and the development of pulmonary edema depended on α -receptor activity and were potentiated by β -receptor activity. "The results suggest an association between the loss of lung ascorbate and the development of catecholamine-induced pulmonary edema in mice."

Other Vitamins. Among other vitamins, nicotinic acid appears to play a prominent role in human psychogenic stress responses in that it inhibits fatty acid mobilization

from adipose tissue and diminishes blood lipids without influencing tachycardia, hypertension or catecholamine secretion. Furthermore, thiamine requirements appear to be directly related to energy expenditure, and a variety of stressors augment the demand for thiamine in man.

Other Vitamins. Taketani, T.: "Variations of total vitamin B₂ content in the cornea, iris and ciliary body and the blood of rabbits in stress. (A preliminary report)." *Folia Ophthalmol. Jap.* **13**: 489-494 (1962).

Chernov, M. S., Hale, H. W. Jr., Wood, M.: "Prevention of stress ulcers." *Am. J. Surg.* **122**: 674-677 (1971).

G86,818/71

Following severe surgical trauma or burns, serum vitamin A levels drop sharply in man. Allegedly, "treatment with high doses of parenteral vitamin A reduces the risk of gastroduodenal ulceration in these severely stressed patients" (23 refs.).

Frattali, V., Robertson, R.: "Nutritional evaluation of humans during an oxygen-helium dive to a simulated depth of 1000 feet." *Aerospace Med.* **44**: 14-21 (1973).

H79,775/73

In man, oxygen-helium dives to a simulated depth of 1000 ft. decreased thiamine excretion and erythrocyte transketolase activity. In one diver these changes persisted to the end of the decompression phase. "Since thiamin requirement is directly related to energy expenditure, it is possible that hyperbaric stress exacerbates exercise and cold stress, thereby creating a greater thiamin demand."

AMP, ADP, ATP and other Nucleotide Derivatives. In the rat brain, electro-shock decreases adenyl nucleotide concentration, and several investigators examined the details of this type of response. It has been suggested that ACTH alters kinase, making it more sensitive to dissociation after binding by cAMP. However, there are differences in the responses of various regions of the brain. Certain stressors increase cAMP in the septum and hippocampus of the rat brain, a phenomenon thought to be involved in the mediation of responses during emotionally-induced stress. These findings and many other investigations suggested that cAMP plays a role in the reaction of the hypothalamo-pituitary system to stressors.

In rats, cAMP and cGMP (cyclic guanosine monophosphate) could be separated to study their behavior during the induction of tyrosine hydroxylase by stress, in the chromaffin cells of the adrenals. When rats swim in cold water, it appears that enhancement of cAMP/cGMP concentration ratios may function as the second messenger for the induction of tyrosine hydroxylase in the adrenal medulla.

Observations on newborn rats showed that, apparently, the functional ACTH-sensitive adenylcyclase system is present by the sixth day, but the presumably hypothalamic mechanism that controls stress-induced ACTH release becomes operative only after about the fifteenth day.

Further studies on this undoubtedly highly important aspect of the stress response would certainly offer great promise.

AMP, ADP, ATP and Other Nucleotide Derivatives. Albaum, H. G., Milch, L. J.: "Adenosine triphosphate changes induced by cold, heat and crush injury." *Am. J. Physiol.* **178**: 293-295 (1954). B97,925/54

F75,204/66

In rats, tourniquet stress increased hepatic nucleotides whereas the reverse was true after adrenalectomy. "This may contribute to the stress sensitivity of these animals." Detailed data are given concerning the differential variations of individual nucleotides, including AMP, ADP, ATP, GMP, GDP, GTP, UMP and so on.

Hollis, V. W. Jr., Ramey, E. R.: "Effect of stress on blood levels of guanine nucleotides." *Proc. Soc. Exp. Biol. Med.* **121**: 104-106 (1966). F61,359/66

"Studies using C¹⁴-labelled guanylic acid demonstrated a rapid disappearance of these substances from the blood of intact and adrenalectomized rats. The application of tourniquets across the hind limbs of these animals produced a significantly decreased clearance of the label from the blood after the tourniquet was removed." Possibly, changes in hepatic function and increased release of intracellular nucleotides resulting from lymphatic involution or cell damage may raise the blood nucleotide pool and induce an apparent delay in the clearance of these substances.

Shima, S., Mitsunaga, M., Kawashima, Y., Taguchi, S., Nakao, T.: "Studies on cyclic nucleotides in the adrenal gland. IV. Effect of ACTH on cyclic nucleotides-dependent protein kinases in the adrenal gland." *Endocrinology* **94**: 650-654 (1974). H85,334/74

Experiments on rats "indicate that the rapid increase in adrenal protein kinase activity following ACTH administration is not solely dependent on the increased cAMP levels or binding of cyclic nucleotides to the kinase. It is suggested that ACTH alters the

kinase making it more sensitive to dissociation after binding cAMP."

Paz, R. L. de la, Dickman, S. R., Grosser, B. I.: "Effects of stress on rat brain adenosine cyclic 3',5'-monophosphate (cAMP) in vivo." *Clin. Res.* **22**: 190A (1974).

H84,811/74

Various stressors (electric shock, restraint) increase the cAMP in the septum and hippocampus of the rat brain. This may be of special importance, since these components of the limbic system might be involved in the mediation of responses during emotionally-induced stress.

Chowers, I., Siegel, A., Conforti, N., Feldman, S.: "Effects of neurogenic and systemic stress on hypothalamic and pituitary cyclic AMP." *Isr. J. Med. Sci.* **10**: 572 (1974).

H89,688/74

Siegel, R., Conforti, N., Feldman, S., Chowers, I.: "Effects of neurogenic and systemic stresses on hypothalamic and adenohypophyseal cAMP content." *Neuroendocrinology* **14**: 24-33 (1974). H83,083/74

Various systemic and neurogenic stressors produced similar but not identical changes in the cAMP content of the rat hypothalamus and adenohypophysis. In any event, presumably, "cAMP plays a role in the response of the hypothalamo-pituitary system to stress."

Strange, R. C., Vetter, N., Rowe, M. J., Oliver, M. F.: "Plasma cyclic AMP and total catecholamines during acute myocardial infarction in man." *Eur. J. Clin. Invest.* **4**: 115-119 (1974). J15,219/74

There is a marked elevation of plasma cAMP during the first hours after myocardial infarction in man. "Patients with the worst prognosis had the highest plasma concentrations of cyclic AMP and total catecholamines."

Guidotti, A., Costa, E.: "Association between increase in cyclic AMP and subsequent induction of tyrosine hydroxylase in rat adrenal medulla. Experiments with swimming stress." *Naunyn Schmiedebergs Arch. Pharmacol.* **282**: 217-221 (1974). J12,854/74

cAMP and cGMP (cyclic guanosine monophosphate) were separated from the medulla to determine the relationship between them, because from the literature cited it is clear that the induction of tyrosine hydroxylase activity in the chromaffin cells is preceded by changes in these compounds. When rats are placed in cold water, "the swimming stress

experiments are in agreement with the view that the enhancement of cyclic AMP/cGMP concentration ratios may function as the second messengers for the induction of tyrosine hydroxylase in adrenal medulla" (12 refs.).

Cote, T. E., Yasumura, S.: "Fluctuations in adrenal cyclic AMP levels in immature rats in response to ACTH and histamine stress." *Fed. Proc.* **33**: 205 (1974).

H83,812/74

Adrenal cAMP levels were studied in rats subjected to treatment with either ACTH (50 mU/rat) or histamine dihydrochloride (0.2 mg/g body wt.). Untreated rats were used as controls in order to preclude the stress of vehicle injections. In 6-day-old rats, the values for adrenal cyclic AMP were: 3.35 pmol/mg in the untreated group; 4.35 pmol/mg in the histamine-treated group; and 37.03 pmol/mg 25 min. after injection of ACTH. The corresponding plasma corticosterone levels were 4.55 µg/100 ml in the untreated group; 5.13 µg/100 ml in the histamine-treated group; and 7.27 µg/100 ml in the ACTH-treated group. In 15-day-old rats, the values for adrenal cyclic AMP were: 4.60 pmol/mg in the untreated group; 45.1 pmol/mg in the histamine-stressed group; and 47.3 pmol/mg in the ACTH-treated group. The corresponding plasma corticosterone levels were: 4.58 µg/100 ml in the untreated group; 14.25 µg/100 ml in the histamine-stressed group; and 14.05 µg/100 ml in the ACTH-treated group." Apparently, the functional ACTH-sensitive adenyl cyclase system is present in rats by the sixth day after birth, but the presumably hypothalamic mechanism which controls stress-induced ACTH release is inoperative until the fifteenth day.

Meerson, F. Z.: "Role of synthesis of nucleic acids and protein in adaptation to the external environment." *Physiol. Rev.* **55**: 79-123 (1975). H81,616/75

Review on the role of nucleic acids in adaptation to various stressors (220 refs.).

Delapaz, R. L., Dickman, S. R., Grosser, B. I.: "Effects of stress on rat brain adenosine 3',5'-monophosphate in vivo." *Brain Res. (Amst.)* **85**: 171-175 (1975). J20,677/75

Observations showing "a relationship between stress and increases in the level of cAMP in several regions of the rat brain. A marked rise is seen in the septum after stress from electric shock or restraint. Smaller increases are seen in hippocampus and brain stem in animals stressed by electric shock. These changes in septum and hippocampus are of interest since these regions are components of the limbic system and, therefore,

might be involved in the mediation of emotional responses during stress."

Terrier, M., Perrier, H.: "Cyclic 3',5'-adenosine monophosphate level in the plasma of the rainbow trout (*Salmo gairdnerii* Richardson) following adrenaline administration and constrained exercise." *Experientia* 31: 196 (1975). K400/75

Creatinine. An increase in urinary creatinine output was noted in submarine personnel undergoing stressful training in underwater tanks, as well as in dogs after surgical trauma, but the change is not considered to be a reliable indicator of stress.

Creatinine. Cook, E. B., Wherry, R. J.: "The urinary 17-ketosteroid output of naval submarine enlisted candidates during two stressful situations." *Hum. Biol.* 22: 104-124 (1950). B48,615/50

In submarine enlisted candidates, stress-producing training in tanks evokes typical manifestations of the G.A.S., including an increase in 17-KS and creatinine output, although the two parameters are not strictly related.

Kuhl, W. J. Jr., Ralli, E. P.: "Effect of acute stress upon blood constituents, white cells, and urine constituents in normal individuals." *Proc. Assoc. for the Study of Internal Secretions—33rd. Meeting*, p. 51. Atlantic City, N.J., 1951. Also in: *J. Clin. Endocrinol. Metab.* 11: 776 (1951).

B58,505/51

Normal men immersed in cold water (9.5°C) for eight minutes showed: "1—A decrease in temperature (immediate, 1 and 2 hours); 2—An increase in systolic and diastolic blood pressure (immediate) and a decrease (2 hours); 3—A decrease in heart rate (1, 2 and 4 hours); 4—An increase in neutrophiles (immediate); 5—A decrease in lymphocytes (2 hours); 6—A decrease in eosinophiles (2 hours); 7—A decrease in serum chloride (immediate); 8—An increase in total proteins (immediate and 4 hours); 9—A decrease in serum water (immediate); 10—An increase in total cholesterol (4 hours); 11—An increase in the urine uric acid/creatinine ratio (2 and 4 hours)." All of these changes were significant and ascribed to stress, but no one indicator gave uniformly positive results.

Schwartz, T. B., Shields, D. R.: "Urinary excretion of formaldehydogenic steroids and

creatinine. A reflection of emotion tension." *Psychosom. Med.* 18: 159-172 (1956).

C25,345/56

In students undergoing stressful final examinations, increased urinary corticoid excretion occurs fairly regularly, but urinary volume and creatinine elimination are not clearly related to the stress of the examinations.

Gairard, A., Marnay-Gulat, C., Raoul, Y.: "Essai d'analyse de la contrainte ulcérogène du Rat par l'étude de l'élimination urinaire de divers ions" (Experimental analysis of restraint ulcerogenesis in the rat by study of the urinary elimination of various ions). *C.R. Soc. Biol. (Paris)* 161: 2132-2136 (1967).

F98,979/67

In rats, restraint ulcers are associated with a decrease in creatinine, chlorine, sodium and calcium excretion. Phosphaturia is increased, whereas potassium elimination does not change.

Ukai, M., Moran, W. H. Jr., Zimmermann, B.: "The role of visceral afferent pathways on vasopressin secretion and urinary excretory patterns during surgical stress." *Ann. Surg.* 168: 16-28 (1968). G60,105/68

In dogs, partial gastrectomy increased vasopressin secretion about thirty-fold. This response was not modified by transection of the vagal pathways, but could be eliminated by cervical cordotomy or dorsal rhizotomy, "indicating that the ascending spinal pain pathways were serving as the predominant afferent pathway." The surgical trauma also decreased endogenous creatinine and osmolal clearance, urinary flow and sodium secretion. The vasopressin discharge is ascribed to stress.

Uric Acid. A rise in uric acid excretion is allegedly an invariable result of ACTH secretion in man, and has even been used as a test for cortical activity. EP, killed bacteria, immersion in cold water, flying overwater missions in military planes, underwater demolition work and other stressors likewise augment the serum and/or urinary concentration of uric acid in man.

Uric Acid. Thorn, G. W., Forsham, P. H., Prunty, F. T. G., Hills, A. G.: "A test for adrenal cortical insufficiency." *J.A.M.A.* **137**: 1005-1009 (1948). D98,669/48

Eosinopenia and a rise in uric acid excretion consistently follow ACTH injection in man, and may be used as a test of adrenocortical activity.

Faurbye, A., Vestergaard, P., Kobbernagel, F., Nielsen, A.: "Adrenal cortical function in chronic schizophrenia (stress, adrenaline-test, ACTH-test)." *Acta Endocrinol. (Kbh.)* **8**: 215-246 (1951). B63,996/51

In man, EP treatment and the production of fever by injections of killed *B. faecalis alcaligenes* are both regarded as adequate "stress tests," as indicated by the increase in uric acid and potassium excretion as well as the hematologic changes that result.

Kuhl, W. J. Jr., Ralli, E. P.: "Effect of acute stress upon blood constituents, white cells, and urine constituents in normal individuals." *Proc. Assoc. for the Study of Internal Secretions—33rd. Meeting*, p. 51. Atlantic City, N.J., 1951. Also in: *J. Clin. Endocrinol. Metab.* **11**: 776 (1951).

B58,505/51

Normal men immersed in cold water (9.5°C) for eight minutes showed: "1—A decrease in temperature (immediate, 1 and 2 hours); 2—An increase in systolic and diastolic blood pressure (immediate) and a decrease (2 hours); 3—A decrease in heart rate (1, 2 and 4 hours); 4—An increase in neutrophiles (immediate); 5—A decrease in lymphocytes (2 hours); 6—A decrease in eosinophiles (2 hours); 7—A decrease in serum chloride (immediate); 8—An increase in total proteins (immediate and 4 hours); 9—A decrease in serum water (immediate); 10—An increase in total cholesterol (4 hours); 11—An increase in the urine uric acid/creatinine ratio (2 and 4 hours)." All of these changes were significant and ascribed to stress, but no one indicator gave uniformly positive results.

Kuhl, W. J. Jr., Wilson, H., Ralli, E. P.: "Measurements of adrenal cortical activity

in young men subjected to acute stress." *J. Clin. Endocrinol. Metab.* **12**: 393-406 (1952). B69,085/52

Normal men immersed in cold water for eight minutes exhibited significant eosinopenia, lymphopenia and hypochloremia with increased urinary ascorbic acid and uric acid excretion. Serum sodium, potassium, blood sugar and ascorbic acid were not significantly altered.

Marchbanks, V. H. Jr., Hale, H. B., Ellis, J. P. Jr.: "Stress responses of pilots flying 6-hour overwater missions in F-100 and F-104 aircraft." *Aerosp. Med.* **34**: 15-18 (1963). G2,360/63

In navy pilots flying six-hour overwater missions in F-100 and F-104 aircraft, corticoid levels were increased in the plasma but not in urine. Urinary EP and NEP values were considerably above normal, as were excretions of urea and uric acid, while phosphate levels were not altered. The total reaction depended very much on airplane characteristics and pilot experience.

Rahe, R. H., Arthur, R. J.: "Stressful underwater demolition training. Serum urate and cholesterol variability." *J.A.M.A.* **202**: 1052-1054 (1967). F91,967/67

In men training for underwater demolition work, the serum urate concentration was elevated during anticipation of a demanding task and "cholesterol levels rose concomitant with a period of particular psychological stress. Serum urate concentration demonstrated a significant fall during a period of quite intense psychological stress."

Kasl, S. V., Cobb, S., Brooks, G. W.: "Changes in serum uric acid and cholesterol levels in men undergoing job loss." *J.A.M.A.* **206**: 1500-1507 (1968). J13,893/68

In people who lose their job or anticipate loss of employment, blood cholesterol and uric acid levels tend to rise, with a return to normal following the stress period of economic uncertainty.

Rahe, R. H., Rubin, R. T., Arthur, R. J., Clark, B. R.: "Serum uric acid and cholesterol variability. A comprehensive view of

Underwater Demolition Team training." *J.A.M.A.* **206**: 2875-2880 (1968).

G63,836/68

Pfeiffer, C. C., Iliev, V., Nichols, R. E., Sugerman, A. A.: "The serum urate level reflects degree of stress." *J. Clin. Pharmacol.* **9**: 384-392 (1969). H18,436/69

"The level of serum urate may reflect the degree of stress in the schizophrenic since serum urate usually decreases with antipsychotic therapy."

Mueller, E. F., Kasl, S. V., Brooks, G. W., Cobb, S.: "Psychosocial correlates of serum urate levels." *Psychol. Bull.* **73**: 238-257 (1970). J21,403/70

An extensive review of the literature and personal observations suggest "that serum uric acid levels change in response to socially and psychologically stressful situations" (about 100 refs.).

Rahe, R. H., Rubin, R. T., Gunderson, E. K. E.: "Measures of subjects' motivation and affect correlated with their serum uric acid, cholesterol, and cortisol." *Arch. Gen. Psychiatry* **26**: 357-359 (1972).

G90,674/72

Among trainees of a U.S. Navy underwater demolition team, "predominantly positive correlations were seen between the subjects' serum uric acid levels and their estimates of their own motivation. Their serum cholesterol concentrations demonstrated consistently negative correlations with their motivational and pleasant affect scores. Highest correlations were positive ones found between the subjects' serum cholesterol levels and their unpleasant affect scores."

Hippuric Acid. Patients who react to psychic or drug-induced stress with free anxiety usually show an elevated hippuric acid excretion following administration of benzoic acid. The reverse is true of those reacting with catatonic withdrawal. However, comparative studies under different conditions showed that hippuric acid excretion is not a particularly reliable indicator of stress.

Hippuric Acid. Persky, H., Grinker, R. R., Mirsky, I. A., Gamm, S. R.: "Life situations, emotions and the excretion of hippuric acid in anxiety states." In: Wolff, H. G., Wolf, S. G. Jr. *et al.*, *Life Stress and Bodily Disease*, pp. 297-306. Baltimore: Williams & Wilkins, 1950. B51,575/50

Patients who react to psychic or drug-induced stress with free anxiety usually show elevated hippuric acid excretion, while a diminution of this acid occurs in those react-

Serum cortisol correlations with the three psychological criteria demonstrated wide variability around a zero correlation baseline."

Machtey, I., Meer, A.: "In certain physiological stress conditions on the problem of hyperuricemia." *Adv. Exp. Med. Biol.* **41**: 419-421 (1974). J24,476/74

Blood levels of uric acid remained essentially constant during menstruation and ovulation but rose considerably during labor and following delivery. "It is therefore an attractive assumption, that the marked stress connected with labour is the possible cause of the hyperuricemia found in the reported cases."

Rahe, R. H., Rubin, R. T., Arthur, R. J.: "The three investigators study. Serum uric acid, cholesterol, and cortisol variability during stresses of everyday life." *Psychosom. Med.* **36**: 258-268 (1974). J21,223/74

The authors studied their own responses to various life events. "Marked elevations in serum cholesterol were seen in one investigator throughout an unpleasant residential move; repeated peaks in serum cortisol were seen in one investigator during times of anguish and anger over personal disappointments and work changes. Two of the three men showed uric acid elevations into the 'gout range' prior to eagerly taking on a physical change. Occasionally, serum uric acid and cortisol values reached magnitudes previously reported as characteristic of men entering underwater demolition training and jumping into the ocean from hovering helicopters."

ing with catatonic withdrawal. "Hippuric acid is a detoxification product of benzoic acid and it is conceivable that alteration in detoxification may represent a homeostatic defense of the organism to stress."

Persky, H., Grinker, R. R., Mirsky, I. A.: "The excretion of hippuric acid in subjects with free anxiety." *J. Clin. Invest.* **29**: 110-114 (1950). J13,730/50

In patients with free anxiety, hippuric acid

excretion is abnormally high after administration of sodium benzoate.

Persky, H., Gamm, S. R., Grinker, R. R.: "Correlation between fluctuation of free anxiety and quantity of hippuric acid excretion." *Psychosom. Med.* **14**: 34-40 (1952). B54,166/52

In patients with manifest anxiety and in individuals exposed to the mild stressors of daily life, hippuric acid excretion increases, but it is subnormal in catatonic schizophrenics.

Persky, H.: "Response to a life stress: evaluation of some biochemical indices." *J. Appl. Physiol.* **6**: 369-374 (1953).

J11,917/53

Pilots under training were subjected to various stressors (parachute jumps, physical exercise and so on) which caused a significant diminution in blood eosinophil and glutathione levels but did not affect the synthesis of hippuric acid from administered sodium benzoate. "These findings are taken to indicate that airborne training focal stresses are of intermediate severity on a scale whose poles are fear of failure and fear of bodily injury."

Basowitz, H., Korchin, S. J., Grinker, R. R.: "Anxiety in a life stress." *J. Psychol.* **38**: 503-510 (1954). B29,178/54

Earlier research has shown that subjects having free anxiety (a feeling of intense

dread and foreboding with generalized apprehensiveness not directed toward any specific object) exhibit an elevated hippuric acid tolerance in the absence of other evidence of liver dysfunction. Moreover, as anxiety is reduced, hippuric acid synthesis is lowered. In the present study, persons with initially elevated hippuric acid tolerance developed higher levels of anxiety under the stress of paratroop training than those with initially low values of this biochemical index, although prior to training the two groups were indistinguishable in their self-ratings of anxiety. Hippuric acid excretion not only distinguishes between neurotics with free anxiety and normal people, but even "normal individuals whose excretion values are very high, although still below levels typifying the condition of free anxiety, are prone toward heightened anxiety in a life stress."

Korchin, S. J., Basowitz, H.: "Perceptual adequacy in a life stress." *J. Psychol.* **38**: 495-502 (1954). J13,189/54

Earlier observations had shown that stress with free anxiety elevates hippuric acid excretion following administration of a standard dose of sodium benzoate. During paratroop training, men with a low hippuric acid discharge prior to the test are uniformly superior in performance, and proneness to stress responses is reflected in the prestressed hippuric acid excretion level.

Glutathione and other -SH compounds. In man, blood levels of glutathione and other -SH compounds are considerably lowered after parachute jumping. The same is true in rats after intense auditory stimulation and other stressors, but this parameter likewise fails to reflect stress with any degree of accuracy and consistency.

Glutathione and other -SH Compounds. Hess, W. C., Kyle, L. H., Doolan, P. D.: "Effect of administration of ACTH and cortisone upon blood glutathione levels." *Proc. Soc. Exp. Biol. Med.* **76**: 418-422 (1951).

B57,533/51

In man, ACTH and cortisone decrease the blood-reduced glutathione levels without significantly altering the total blood glutathione values. [It remains to be shown whether endogenous ACTH and glucocorticoids liberated during stress act similarly (H.S.).]

Persky, H.: "Response to a life stress: evaluation of some biochemical indices." *J. Appl. Physiol.* **6**: 369-374 (1953).

J11,917/53

Pilots under training were subjected to various stressors (parachute jumps, physical exercise and so on) which caused a significant diminution in blood eosinophil and glutathione levels, but did not affect the synthesis of hippuric acid from administered sodium benzoate. "These findings are taken to indicate that airborne training focal stresses are of intermediate severity on a scale whose poles are fear of failure and fear of bodily injury."

Persky, H.: "Glutathione metabolism in men under psychological stress." *Psychosom. Med.* **16**: 489-495 (1954). J13,307/54

In man, blood-reduced glutathione is considerably lowered five to ten hours after parachute jumping, but not after severe

physical exercise. Despite this apparent lack of nonspecificity, "it is postulated that severe psychological stress operating over long periods may produce irreversible depression of the blood glutathione level and its associated metabolic dysfunctions."

Beck, L. V., Linkenheimer, W. H., Marraccini, A.: "Effects of tumbling trauma, scalding and hemorrhage on rat tissue non-protein sulphydryl." *Proc. Soc. Exp. Biol. Med.* **86**: 823-827 (1954). J24,111/54

"Significant decreases in concentration of non-protein -SH were noted in rat liver following tumbling trauma, and in rat liver and kidney following severe scalding. In analyses confined to the liver, a significant decrease in liver non-protein -SH was noted following severe hemorrhage."

Register, U. D., Bartlett, R. G. Jr.: "Regeneration of tissue nonprotein sulphydryl compounds in rats after exposure to cold and restraint." *Proc. Soc. Exp. Biol. Med.* **86**: 836-838 (1954). B98,154/54

Rats exposed to cold or restraint stress exhibited "a lowering of concentration of the total nonprotein sulphydryl compounds (NPSH) in the liver. . . . Recovery was completed in fasting and nonfasting animals in less than 8 hours, with a transient overcompensation in both categories."

Register, U. D., Sorsa, A. M. Ia, Katsuyama, D. M., Smith, H. M.: "Soluble sulphydryl changes in dietary and environmental stress." *Am. J. Physiol.* **197**: 1353-1356 (1959). C79,673/59

Jurtshuk, P. Jr., Weltman, A. S., Sackler, A. M.: "Biochemical responses of rats to auditory stress." *Science* **129**: 1424-1425 (1959). C68,703/59

In rats, prolonged intense auditory stimulation reduced the glutathione level of the blood simultaneously with an increase in the weight, ascorbic acid and cholesterol content of the adrenals.

Stout, D. A., McCartney, R. L., Lewis, B. M., Smith, H. M., Register, U. D.: "Effect of cold and restraint on intracellular distribution of glutathione in rat liver." *Proc. Soc. Exp. Biol. Med.* **112**: 334-335 (1963). D58,524/63

Ellman, G. L., Sullivan, C. V.: "Sulphydryl reactivity in the central nervous system: effects of electro-shock." *Exp. Neurol.* **13**: 191-197 (1965). J22,996/65

In the rat brain, reactive SH groups are normally found in neuroglia cells, but after electroshock the number of these cells increases. In addition, neurons also show SH reactivity.

Murdoch, J. L., Hoenes, R. L., Ekkens, D. A., Russell, C. A., Register, U. D.: "Role of the pituitary and adrenals in cold and restraint induced liver nonprotein sulphydryl depletion." *Proc. Soc. Exp. Biol. Med.* **124**: 274-276 (1967). F76,099/67

"A significant decrease in liver nonprotein sulphydryl levels (LNPSH) was demonstrated in intact, hypophysectomized and adrenalectomized female rats in response to cold and restraint. A similar response was demonstrated following epinephrine injection. Neither ACTH nor cortisol replacement was necessary for this response. It is concluded that maximum LNPSH depletion during cold and restraint can be effected through stimulation of the sympathetic nervous system although other mechanisms are operative in intact animals."

Varma, R. R., Khuteta, K. P., Dandiya, P. C.: "The effect of some psychopharmacological agents on heat stress-induced changes in the glutathione levels of brain and blood in rats." *Psychopharmacologia* (Berlin) **12**: 170-175 (1968). G54,762/68

Khuteta, K. P., Mathur, K. N., Mali, S. L.: "Effect of exposure to heat on total blood sulphydryl (SH) groups in human beings." *Indian J. Med. Res.* **57**: 1767-1768 (1969). G73,777/69

In man, "heat stress" causes a decrease in blood sulphydryl groups.

Gupta, M. L., Khuteta, K. P., Mathur, K. N.: "Blood total sulphydryl groups in human beings after surgery." *J. Indian Med. Assoc.* **55**: 199-201 (1970). G80,624/70

In man, the total sulphydryl content of the blood decreased significantly after various types of stress. Similar results have been observed by earlier investigators following other stressors.

DNA, RNA. In rats, thymus involution induced by cortisol or stressors is associated with a considerable decrease in DNA and RNA, but systematic studies on the

effect of the G.A.S. upon the nucleic acid metabolism of the thymus have not yet been undertaken.

A so-called "stress satellite DNA" appears in seedlings of certain plants upon exposure to stress, but this is probably of bacterial origin and does not signify an amplification of ribosomal RNA genes as a consequence of stress.

DNA, RNA. Macchitella, E., Crucitti, F.: "Modificazioni surrenaliche in corso di ustioni sperimentali. Azione dello stress sull'attività mitotica e sul comportamento degli acidi nucleinici" (Adrenal modifications during experimental burns; effect of stress on mitosis and nucleic acids). *Chir. Patol. Toma, V., Abraham, A. D., Pora, E. A.: "Nucleic acids in thymus involution and regeneration." *Rev. Roum. Biol.* **16**: 185-188 (1971). J10,495/71

In rats, the thymus involution produced by cortisol is associated with a considerable decrease in DNA and RNA. The values return to normal after several weeks and probably reflect similar changes caused by stressors through glucocorticoid liberation.

Wannemacher, R. W. Jr.: "Ribosomal RNA synthesis and function as influenced by RNA supply and stress." *Proc. Nutr. Soc.* **31**: 281-290 (1972). H80,192/72

Earlier observations showed that various stressors influence amino acid distribution in tissues. The present experiments on rats used mineralocorticoid hypertension to produce cardiac hypertrophy, and Walker tumor or infection to induce liver enlargement. The associated influx of amino acids and increase in RNA and protein synthesis in the enlarged organs were ascribed to a "stress-related flux of amino acids." [The reason for this interpretation is not quite clear (H.S.).]

Pearson, G. G., Ingle, J.: "The origin of stress-induced satellite DNA in plant tissues." *Cell Different.* **1**: 43-51 (1972).

G90,501/72

A so-called "stress-satellite DNA" is induced in growing seedlings of various *Cu-*

curbitaceae exposed to darkness, trauma and other stressors. The present observations suggest that in response to cold storage, the appearance of the stress-satellite is of bacterial origin and therefore cannot be "taken as evidence for the amplification of the ribosomal-RNA genes under this condition of physiological stress."

Baskin, F., Masiarz, F. R., Agranoff, B. W.: "Effect of various stresses on the incorporation of [³H]orotic acid into goldfish brain RNA." *Brain Res. (Amst.)* **39**: 151-162 (1972). J20,141/72

Earp, H. S.: "Glucocorticoid regulation of transcription: the role of physiologic concentrations of adrenal glucocorticoids in the diurnal variation of rat liver chromatin template availability." *Biochim. Biophys. Acta* **340**: 95-107 (1974) (53 refs.).

Rose, K. D., Maca, R., Pace, D. M.: "Sterol synthesis by cells cultured on serum from heat-stressed chickens." *Proc. Soc. Exp. Biol. Med.* **108**: 282-285 (1961).
D89,507/61

"Young chickens subjected to heat stress at 102°F for 24 hours elaborate a stress factor into their blood stream. When serum from these animals is used as an adjuvant in a serum-balanced salt solution medium, cells grown on this medium accumulate large numbers of small lipid droplets within their cytoplasm." Possibly, this factor may account for the hypercholesterolemia characteristic of stress in vivo.

Gidron, E., Czaczkes, J. W., Yaron, E.: "Increased uroporphyrin excretion in response to stress." *Clin. Sci.* **22**: 409-412 (1962).
D27,276/62

Urinary uroporphyrin excretion rose after exposure to various stressors in man.

Brayer, F. T.: "Influence of plasma from a variety of stressed animals on I¹³¹ uptake in chick embryos." *J. Nucl. Med.* **4**: 312-319 (1963).
J23,190/63

"Plasma from rats, guinea pigs and rabbits exposed to whole-body x-irradiation when in-

jected into 15 day old chick embryos elicits a significant increase in the I¹³¹ uptake of the thyroid." The thyroid and pituitary appear to be essential to elicit this response, whereas the adrenal is not. This phenomenon is not produced by certain others stressors, such as violent exercise or abnormal environmental temperatures.

Leonov, B. V., Lomova, M. A., Rudakov, I. A.: "Connection of radiosensitivity of rats with antioxidative activity of bone marrow and content of unesterified fatty acids in their blood under conditions of 'stress.'" *Radiobiologia* **3**: 518-522 (1963) (Russian). Engl. trans.: *Radiobiology* **3**: 43-49 (1963).
J24,546/63

Experiments on rats "suggested that the increased expenditure of *antioxidants* under conditions of 'stress' may be connected with mobilization of fats from fat depots and that one of the mechanisms of the increase of radiosensitivity of animals in 'stress' can be the oxidation of mobilized lipids." It is assumed that cross-sensitization by stressors to x-rays may result from the loss of antioxidants during stress.

Dedichen, J., Laland, P., Laland, S. G.: "The effect of material prepared from ox blood on cold stress in mice." *Acta Pathol. Microbiol. Scand.* **58**: 219-224 (1963).
E22,664/63

High molecular material prepared from ox blood after exposure to stress significantly reduces the mortality of cold-stressed mice. "It is suggested that the material is related to a hypothetical *resistance factor* mentioned in the work of Raskova and Vanecek."

Fessel, W. J.: "Dextran turbidity: acute

distress-phase reaction." *Nature* **205**: 771-773 (1965). F32,709/65

Among patients treated for various types of psychogenic stress, heavy turbidity in the plasma occurs after additional dextran therapy. This response can also be induced experimentally by exposing the subjects to stressful mental experiences. "The presence of so much fibrinogen in the precipitate suggests the possibility that the increased levels of *dextran turbidity* in mental disease and emotional stress result from activation of various serum enzyme systems which cause changes in the internal structure of blood proteins. Plasmin, which affects the fibrinogen molecule, is activated by various agents including emotional stress, physical stress, adrenal steroids, adrenaline, acetylcholine and histamine, and some evidence suggests that plasmin may be under reflex control. Other serum enzymes are also activated by stress, which is known to influence a variety of blood proteins" (20 refs.).

Pretreatment with various stressors (cold, trauma, electroshock) greatly increased the sensitivity of rats to *amphetamine*. The stressors did not alter the MAO, NEP, 5-HT or amphetamine levels of the brain, but when amphetamine preceded electroshock its brain concentration was significantly raised. Yet, even then, the change could not account for the increased toxicity of the stimulant (18 refs.).

The literature and personal observations on rats suggest that stress increases the synthesis of the *seromucoid* fraction of plasma proteins.

Huxtable, R., Bressler, R.: "Taurine concentrations in congestive heart failure." *Science* **184**: 1187-1188 (1974). H86,743/74

The *taurine* concentration in the left ventricle of patients who died of chronic congestive heart failure was about twice the normal level. "Stress-induced hypertension in rats also led to an increase in taurine concentration in the heart, whereas that in skeletal muscle and brain showed no significant alteration when compared to unstressed animals. Spontaneously hypertensive rats of the Wistar-derived Okamoto strain, showed a similar elevation in cardiac taurine compared to age-matched control Wistar rats." The stressors used were noise, light and vibration.

MORPHOLOGIC CHANGES (including macroscopic, light and electron microscopic changes)

[Changes in somatic growth have been discussed under Chemical Changes in the section on Body Weight]

Hypothalamo-Hypophyseal System

The comparatively few papers that deal with morphologic changes induced by stress in the CNS, particularly the hypothalamus, will be discussed under Theories, in connection with other observations on the role of the hypothalamo-hypophyseal system in the mediation of stress reactions.

Singularly few observations deal specifically with structural changes elicited by stress in the hypophysis, although this gland undoubtedly occupies a central role in the regulation of hormonal defense mechanisms in the G.A.S. Our earlier studies in the rat showing that, during the alarm reaction, nuclear pyknoses appear in some circumscribed regions of the anterior lobe, while other parts may remain normal. After chronic treatment with various types of stressors, an increase in the number of basophils was frequently observed. Many of these were found to assume a "signet ring cell" appearance, not unlike that of "castration cells." This change may have been related to the gonadal atrophy that is induced by chronic exposure to stressors.

In the intermediate lobe, the epithelial cells tend to degenerate during the alarm reaction, and the borderline between the middle and posterior lobe may become indistinct. Occasionally, one has the impression that debris of degenerated middle lobe cells, and perhaps even anterior lobe basophils, invade the posterior lobe. In the latter, vacuolization of the pituicytes with the development of "foam cells" is not uncommon.

Hypertrophy and hyperplasia of the basophils have also been observed by other investigators in rats exposed to stressors, but in all these experiments it was very difficult to separate specific from stress-induced lesions. In any event, no particularly significant

contribution has been made to this topic since the publication of my last series of stress monographs.

Adrenals

Loss of lipids from the adrenal cortex and a loss of chromaffin material from the medulla were among the first morphologic changes noted in animals and man exposed to what we would now call "stressors." Such observations were published even before the stress syndrome as such had been recognized, and the alterations were generally ascribed to the specific effects of whatever agents induced them. After chronic exposure to stressors, the initial loss of cortical lipids usually gives way to replenishment of the

secretory granules in the stage of resistance, at which time their amount may even exceed the initial value; but eventually, during the stage of exhaustion, a secondary loss of lipids ensues. These light microscopic changes (usually detected by special stains, such as Sudan red or osmic acid) have also been confirmed by EM. They are generally associated with a corresponding loss of stainable cholesterol and ascorbic acid granules. According to some investigators, it is possible to demonstrate parallel variations of adrenal KS by special histochemical techniques.

These morphologic indicators of increased secretory activity are associated with hyperplasia and mitotic divisions of the adrenocortical cells, especially in the fasciculata.

In the event of exposure to various severe stressors—especially extensive burns and certain bacterial infections—the adrenocortical changes may be accompanied by more or less widespread necrosis, and even bleeding. However, some of these changes, particularly those induced by bacterial toxins, may be modified by the specific actions of the stressors, for example, by the special vasotoxic effects that cause adrenal hemorrhages (as in the Waterhouse-Friderichsen syndrome).

In the case of chronic exposure to stressors, adrenal adenomas or at least adenoma-like enlargements of capsular accessory adrenals are noted in various species, including man. In spontaneously hypertensive rats, such nodule formation is especially common.

EM studies on squirrel monkeys revealed depletion and disorientation of membranes, both of the overdeveloped SER and mitochondria, with a loss of ribosomes, lysosomes, and, to some degree, intracellular lipids.

The infiltration of the adrenals by hemopoietic elements in tumor-bearing rats as well as in those injected with necrotic tissue material is undoubtedly not merely a manifestation of stress, but presumably a specific response to certain toxic materials liberated from dying tissues.

The frequently-encountered statement that during the stage of exhaustion, the collapse of resistance is secondary to a breakdown of adrenal tissue is far from being proven by experimental observations. Although chronic stress may cause degenerative changes or even necroses in the adrenal glands, these are rarely of sufficient intensity not to be amply compensated for by the characteristic hypertrophy and hyperplasia.

The changes in the adrenal medulla are much less polymorphic and mainly limited to evidence of an EP discharge.

In birds, the cortical and medullary cells are intermixed, but there is some evidence that certain regions of the avian interrenal (cortical) tissue may correspond to the zones of the mammalian adrenal cortex. Hypophysectomy causes only a slight decrease in the weight of the pigeon adrenal, mainly as a result of interrenal cell atrophy near the center of the gland.

Stress elicits hypertrophy and hyperplasia of both interrenal and chromaffin tissue, even in hypophysectomized pigeons. These and other observations suggest that the interrenal (cortical) cells in birds are much less dependent upon the pituitary than in mammals.

Occasionally, entire cortical cells have been found within the sinusoids of the adrenals, a phenomenon interpreted as holocrine secretion. This has been noted in the rat, and particularly in the giraffe; it may be enhanced by stress.

Stress-induced adrenal changes have been described in virtually every animal species and after exposure to all types of stressor agents. However, for these, the reader is referred to the abstract section.

Adrenals

(See also our earlier stress monographs, p. xiii)

Babes, V., Jonesco, V.: "Études sur la diminution de la graisse surrenale dans des états pathologiques" (Studies of adrenal lipid decrease in pathologic states.) *C.R. Soc. Biol. (Paris)* **65**: 267-269 (1908).

46,790/08

In rabbits, both diminution and redistribution of adrenal lipids were observed after inanition, various infectious diseases, or repeated injections of EP. Similar changes were noted in humans following death from myocarditis, tuberculosis, certain types of nephritis, enteritis, cholecystitis and pancreatitis. The significance of these changes was not analyzed.

Greenwald, H. M., Eliasberg, H.: "The pathogenesis of death from burns." *Am. J. Med. Sci.* **171**: 682-696 (1926).

B26,710/26

In man and rabbits, extensive burns cause an initial state of shock with hyperglycemia, followed by hypoglycemia and adrenal changes. This process is interpreted as initial stimulation followed by exhaustion.

McEuen, C. S., Selye, H.: "Histologic changes in the adrenals of tumor-bearing rats." *Am. J. Med. Sci.* **189**: 423-424 (1935).

36,705/35

In rats bearing large necrotizing Walker tumors, the adrenals were enlarged and contained many lymphocytic and leukocytic infiltrations. Since similar islands are occasionally seen after various infections, they cannot be regarded as specific for tumors.

Hilgenfeldt, O.: "Die Behandlung und die pathogenetischen Grundlagen der Verbrennungen" (The pathogenesis and treatment of burns). *Ergeb. Chir. Orthop.* **29**: 102-210 (1936).

38,008/36

Review, especially of the old literature, and personal observations on the histologic changes induced by severe surface burns in man. They may be due to shock or to the resorption of protein decomposition products and bacteria from the damaged areas. "It may be assumed that after several weeks exhaustion of the adrenals may become equivalent to their total elimination."

Selye, H.: "Studies on adaptation." *Endocrinology* **21**: 169-188 (1937).

38,798/37

First detailed description of the three stages of the G.A.S. and the concept of

"adaptation energy," with an extensive and illustrative characterization of the morphologic lesions produced by stress (especially in the hypophysis, adrenals, thymicolympathic apparatus, pancreas and gastrointestinal tract), and its effect upon inflammation (anaphylactoid edema).

85,089/44

Review on the functions of the adrenal cortex, with special reference to its role in resistance to stress during the G.A.S. (531 refs.).

Ludewig, S., Chanutin, A.: "The adrenal cholesterol and ascorbic acid contents after injury." *Endocrinology* **41**: 135-143 (1947).

B2,706/47

In rats, pentobarbital anesthesia and ther-

mal injury, as well as nitrogen and sulphur mustards, cause adrenal enlargement, usually with an initial decrease followed by an increase in adrenal ascorbic acid and cholesterol.

Nichols, J.: "Quantitative histochemical changes in the adrenal following exposure to anoxia." *J. Aviat. Med.* **19**: 171-178 (1948).

B26,390/48

In rats, anoxia depletes the adrenal cholesterol esters before the free cholesterol. The other lipid fractions disappear even more slowly. Conversely, cholesterol esters recover last upon interruption of anoxia. The changes are ascribed to the G.A.S. (29 refs.).

Dugal, L. P., Thérien, M.: "The influence of ascorbic acid on the adrenal weight during exposure to cold." *Endocrinology* **44**: 420-426 (1949).

B36,429/49

In guinea pigs as in rats, exposure to cold elicits all the manifestations of the alarm reaction, including ascorbic acid depletion. Treatment with ascorbic acid inhibits adrenal enlargement and raises resistance to cold.

Selye, H., Stone, H.: *On the Experimental Morphology of the Adrenal Cortex*, p. 105. Springfield, Ill.: Charles C Thomas, 1950.

B30,224/50

Brief monograph on the structure and interpretation of various adrenal changes with special reference to those induced by stress.

Mandl, A. M., Zuckerman, S.: "The reaction of the ovaries and adrenal glands of female rats to ovarian and muscle homografts." *J. Endocrinol.* **7**: 344-348 (1951).

B63,009/51

In rats, homografts of ovarian or muscle tissue caused adrenal and ovarian enlargement. The adrenals (but not the ovaries) were also hypertrophied following Avertin anesthesia. The possibility is considered that these reactions may be manifestations of stress.

Rabinovici, N.: "The effect of stress upon the ketosteroid and non-carbonyl lipid content of the adrenal cortex of the rat." *Endocrinology* **49**: 579-588 (1951).

B64,021/51

In rats, various stressors (cold, x-rays, starvation) and ACTH caused depletion of histochemically demonstrable adrenal KS.

Bullough, W. S.: "Stress and epidermal mitotic activity. I. The effects of the adrenal hormones." *J. Endocrinol.* **8**: 265-274 (1952).

B72,094/52

In rats the stress of overcrowding causes a more pronounced increase in the size of the adrenal medulla than of the cortex. Simultaneously, the epidermal mitotic rate decreases by 60 percent. "It is suggested that the antimitotic effects of stress may be due to a high rate of secretion of either or both of these adrenal hormones" (corticoids and catecholamines). All these reactions are regarded as manifestations of the G.A.S.

Woods, J. W.: "Differences in adrenal response to adverse conditions in wild and domesticated Norway rats." *Fed. Proc.* **12**: 159 (1953).

B78,653/53

Wild and domesticated Norway rats were exposed to various stressors (cold, noise, fighting). "The results show that the wild rat endures the conditions of these experiments without a decrease in the amount of assayable ascorbic acid or stainable lipid in his adrenal cortex while results with the white rat are in agreement with the numerous reports of ascorbic acid and lipid depletion following similar stimulation." Also, the adrenals of the wild rat are less sensitive than those of domesticated rats to traumatization of the intestines, hemorrhage, ether anesthesia, unilateral adrenalectomy or even ACTH administration, as indicated by ascorbic acid depletion.

Bahn, R. C., Glick, D.: "Studies in histochemistry: effects of stress conditions, ACTH, cortisone and desoxycorticosterone on the quantitative histological distribution of ascorbic acid in adrenal glands of the rat and monkey." *Endocrinology* **54**: 672-684 (1954).

B94,671/54

In monkeys (*M. rhesus*, *M. cynomolgus*) and in rats, various stressors (cold, struggling, ether anesthesia, hypoxia, and hyperthermia) cause a decrease in the ascorbic acid content of the outer fasciculata and reticularis zones of the adrenal cortex. Intrapерitoneal ACTH produced the same result.

Heroux, O., Hart, J. S.: "Comparison of four indices of adrenal activity in rats acclimated to 30°, 15°, 1°C." *Am. J. Physiol.* **178**: 445-448 (1954).

mentali. Azione dello stress sull'attività mitotica e sul comportamento degli acidi nucleinici" (Adrenal modifications during experimental burns. Effect of stress on mitosis and nucleic acids). *Chir. Patol. Sper.* **4**: 655-673 (1956). C41,613/56

Symington, T., Davidson, J. N.: "The effect of exogenous ACTH and conditions of stress on the chemical composition of the human adrenal gland." *Scott. Med. J.* **1**: 15-31 (1956). C12,943/56

Sackler, A. M., Weltman, A. S., Bradshaw, M., Jurtshuk, P. Jr.: "Endocrine changes due to auditory stress." *Acta Endocrinol.* (Kbh.) **31**: 405-418 (1959). C71,159/59

In rats, repeated exposure to strong auditory stimulation causes adrenal enlargement, ovarian atrophy and diminution in the weight of the uterus and liver. Food consumption is also markedly reduced.

Jurtshuk, P. Jr., Weltman, A. S., Sackler, A. M.: "Biochemical responses of rats to auditory stress." *Science* **129**: 1424-1425 (1959). C68,703/59

In rats, prolonged, intense auditory stimulation reduced the glutathione level of the blood, and simultaneously caused an increase in the weight, ascorbic acid and cholesterol content of the adrenals.

Kerckhove, D. van de: "Variation de la teneur en acide désoxyribonucléique dans les cellules de la granulosa chez le rat lors du stress par le froid" (Variation in the desoxyribonucleic acid content of the granulosa cells of rats during cold-induced stress). *Ann. Endocrinol.* (Paris) **20**: 893-896 (1959). C85,242/59

Hill, M., Dvořák, K., Pospíšil, M.: "Stress activation of adrenal glomerulosa." *Nature* **183**: 1819 (1959). C73,699/59

In rats, stress induced by formalin causes neutrophilic leukocytosis, lymphopenia, eosinopenia and simultaneous activation of the zona glomerulosa in the adrenals.

[Pathol. Anat.]* **335**: 165-179 (1962). D34,734/62

Deane, H. W.: "The anatomy, chemistry and physiology of adrenocortical tissue." In: Eichler, O. and Farah, A., *Handbuch der Experimentellen Pharmakologie*, Vol. XIV, Part 1, pp. 1-185. Berlin: Julius Springer, 1962. D53,082/62

Extensive chapter on the anatomy, chemistry and physiology of the adrenal cortex, with detailed discussions on the effect of stress (several hundred refs.).

Symington, T.: "Morphology and secretory cytology of the human adrenal cortex." *Br. Med. Bull.* **18**: 117-120 (1962). D23,887/62

Review of the literature and personal observations on the histologic changes produced by stress in the adrenal of man.

Brenner, R. M.: "Radioautographic studies with tritiated thymidine of cell migration in the mouse adrenal after a carbon tetrachloride stress." *Am. J. Anat.* **112**: 81-86 (1963). D56,443/63

In mice stressed by subcutaneous carbon tetrachloride, ^3H -thymidine was given to study its incorporation into DNA-synthesizing cells by stripping film autoradiography.

"Labeled cells were initially distributed at the periphery of the cortex scattered between the glomerulosa and the upper fasciculata, but within four to six weeks heavily labeled cells were found deep within the cortex indicating that centripetal migration had occurred. The upper fasciculata was judged to be a region of maximum cell turnover from which cells had migrated centripetally, but migration of cells from the glomerulosa seemed to be minimal."

Jonek, J., Konecki, J.: "Über die histochemische Lokalisation einiger Enzyme in Rattennebennieren nach intraperitonealer Implantation autogener Organe" (On the histochemical localization of enzymes in the rat adrenal gland following intraperitoneal implantation of autogenous organs). *Z. Mikrosk. Anat. Forsch.* **70**: 536-547 (1963).
G14,659/63

Detailed description of the histochemical changes that occur in rat adrenals after intraperitoneal implantation of autogenous organs. Such alterations are considered to be characteristic of the G.A.S., since they correspond to those produced by other stressors.

Wolman, M.: "Lipides" (Lipids). In: Graumann, W. and Neumann, K., *Handbuch der Histochemie*, Vol. V, Part 2, p. 750. Stuttgart: G. Fischer Verlag, 1964.
E4,270/64

A chapter on lipids in which a special section is devoted to histochemical changes in adrenocortical lipids during stress. An extensive source of the relevant literature.

Pauly, J. E.: "An interpretation of the structural variations seen in the human adrenal cortex in health and disease." *Bull. Tulane Med. Fac.* **24**: 251-264 (1965).
G29,012/65

The adrenals of forty-nine persons who died accidentally were compared with those of 243 patients who succumbed to a variety of systemic diseases. The changes found only in the sick persons are described in detail. They are allegedly "produced either (1) directly by the stress of the systemic disease, (2) by modifications of the gland itself which allows it to increase its efficiency in combatting the stress or (3) by conditions transient between normal and more abnormal degenerative states. These possibilities are discussed in light of the General Adaptation Syndrome" (32 refs.).

Vecsei, P., Csalay, L.: "Vergleichende Untersuchungen über die Corticosteroidbildung

und das morphologische Verhalten der Nebennieren bei chronischen Reizen ausgesetzten Tieren" (Comparative study of corticosteroid formation and the morphologic behavior of the adrenal glands in animals exposed to chronic stress). *Z. Vitamin, Hormon. Fermentforsch.* **14**: 57-65 (1965).

F39,102/65

In rats, the enlargement of the adrenals does not necessarily parallel corticosterone production under the influence of various stressors.

Gabbiani, G., Selye, H., Tuchweber, B.: "Adrenal localization of a thrombohemorrhagic phenomenon." *Endocrinology* **77**: 177-182 (1965).
G19,450/65

In rats pretreated with ACTH, glucocorticoids or restraint, a single intravenous injection of thorium dextrin (an RES-blocking agent) produces thrombohemorrhagic necrosis of the adrenals and liver resembling the Schwartzman-Sanarelli phenomenon.

Khamidov, D. K., Voitkevich, A. A., Zufarov, K. A., Ovchinnikova, G. A.: *The Adrenal Gland (Experimental-Morphologic Investigation)*, p. 358. Tashkent: Fan, 1966 (Russian).

E7,238/66

Monograph on the normal and pathologic histology of the adrenal with sections on its response to stressors. Special attention is given to the Russian literature (several hundred refs.).

Miller, R. A.: "Regional responses of interrenal tissue and of chromaffin tissue to hypophysectomy and stress in pigeons." *Acta Endocrinol. (Kbh.)* **55**: 108-118 (1967).

F79,962/67

In pigeons the cortical and medullary cells of the adrenals are intermixed, and hence three distinct cortical zones, such as are seen in mammals, cannot be distinguished. Yet there is some evidence that certain regions of the avian interrenal tissue may be homologous with the mammalian cortical zones. Hypophysectomy causes only a slight decrease in the weight of the pigeon adrenal, and this is due mainly to atrophy of interrenal (cortical) cells near the center of the gland. Stress (repeated injections of formalin on a low sodium diet) elicits hypertrophy and hyperplasia of both interrenal and chromaffin tissue, even in hypophysectomized pigeons.

Leites, F. L., Semashko, M. I., Zakharova, N. S.: "The dynamics of morphological changes of the adrenal cortex after anti-pertussis vaccination." *Biull. Èksp. Biol. Med.* **66** No. 10: 115-119 (1968) (Russian).

Penney, D. P., Brown, G. M.: "The fine structural morphology of adrenal cortices of normal and stressed squirrel monkeys." *J. Morphol.* **143**: 447-466 (1971).

G85,767/71

In squirrel monkeys, EM observations show a close correlation between hyperdevelopment of the agranular reticulum and increased plasma cortisol levels during the stress of chair restraint. There is also "depletion and disorientation of membranes both of the agranular endoplasmic reticulum and

mitochondria and a loss of ribosomes, lysosomes and, to some degree, intracellular lipid."

Rhodin, J. A. G.: "The ultrastructure of the adrenal cortex of the rat under normal and experimental conditions." *J. Ultrastruct. Res.* **34**: 23-71 (1971). G82,359/71

EM changes in the adrenal cortex of the rat following inhibition by dexamethasone or stimulation by ACTH. These studies give certain indications concerning the interpretation of stress-induced alterations (127 refs.).

Rantsios, A.: "Some observations on the histology of the adrenal zona glomerulosa in Pietrain pigs." *Vet. Rec.* **90**: 369-370 (1972). J20,516/72

Nvota, J., Lamošová, D., Fáberová, A.: "Critical periods in the development of chicks." *Physiol. Bohemoslov.* **22**: 337-343 (1973). J21,555/73

The stress of restraint during a critical period of about three to four weeks after hatching produced a maximal decrease in thyroid activity in adulthood and a significant drop in the BMR of the chick. "The critical phase for regulation of the function of the pituitary-adrenal and pituitary-gonad axis was found to be the period between the 15th and 21st day after hatching. Exposure to stress in this phase caused a significantly greater reaction of the adrenals to stress situations in the adult hens and significantly stimulated sexual maturation (egg-laying)."

Sugihara, H., Kawai, K., Tsuchiyama, H.: "Pathology of intracortical nodules in rat adrenal glands, especially on their fine-structure." *Acta Pathol. Jap.* **23**: 253-260 (1973). J7,946/73

In rats exposed to the stressor effect of a cold or hot environment, numerous intracortical adenomas appear in the adrenals. Their EM structure is described. In spontaneously hypertensive rats, such nodule formation is particularly frequent.

Lunderquist, A., Voegeli, E.: "Angiographic findings in the adrenals during stress." *Am. J. Roentgenol.* **119**: 560-563 (1973). J8,173/73

Angiographic studies during stress secondary to hemorrhage or trauma showed a marked accumulation of contrast medium in the human adrenal after injection into the celiac artery. In three patients, there was also adrenal hemorrhage.

Koerker, R. L., Hahn, W. E., Schneider,

F. H.: "Electron translucent vesicles in adrenal medulla following catecholamine depletion." *Eur. J. Pharmacol.* **28**: 350-359 (1974). H93,911/74

In rabbits, insulin-induced hypoglycemia produces a typical stress reaction with characteristic changes in the adrenal medulla. From EM observations, "it is concluded that the translucent vesicles arise from dense core chromaffin vesicles and decrease in number as the catecholamine stores are replenished."

Weyrauch, D.: "Über das Vorkommen von Parenchymzellteilen im Sinusoidsystem, im subendothelialen und interstitiellen Raum der Nebennierenrinde der Masaigiraffe (Giraffa camelopardalis tippelskirchii)" (The occurrence of parenchymal cell fractions in sinusoids and in the subendothelial and interstitial space of the adrenal cortex in Masai giraffes [Giraffa camelopardalis tippelskirchii]). *Anat. Anz.* **135**: 267-276 (1974). J13,520/74

EM studies on Masai giraffes showed that certain adrenocortical cells can be found free within the sinusoids. Such a holocrine type of secretion may be enhanced by exposure to stress, although this has not yet been proven.

Faussone-Pellegrini, M. S.: "Ultrastruttura dello spazio pericapillare della corticosurrene di ratti esposti alle basse temperature" (Ultrastructure of the adrenal cortex pericapillary space in rats exposed to low temperature). *Boll. Soc. Ital. Biol. Sper.* **50**: 250-252 (1974). J22,854/74

Clark, O. H., Hall, A. D., Schambelan, M.: "Clinical manifestations of adrenal hemorrhage." *Am. J. Surg.* **128**: 219-224 (1974). J15,481/74

Al-Lami, F., Farman, N.: "Ultrastructural and histochemical study of the adrenal medulla in normal and cold-stressed Syrian hamsters." *Anat. Rec.* **181**: 113-129 (1975). J19,965/75

Ray, P. K., Choudhury, S. R.: "Response of solitary adrenal gland to surgical stress." *Histochem. J.* **7**: 127-137 (1975). J24,030/75

Histochemical observations of various enzymes showed that trauma produces essentially the same response in intact and unilaterally adrenalectomized rats. However, after this operation, the enzymatic responses in the remaining gland are significantly delayed by removal of the contralateral gland. "In experiments using ACTH, the overall pat-

tern of esterase activity shows little deviation from that observed in untreated cases in both groups of animals. The findings indicate that in unilaterally adrenalectomized animals, superadded operative stimuli fail to evoke the early response characteristic of the normal adrenal glands. Such latency points to the

vulnerability of their existing defence mechanisms. The remarkable similarity of adrenal response with or without exogenous ACTH in these animals suggests that the reason for a delayed response is rooted in the target organ itself, and is not due to an altered plasma ACTH level."

Thyroid

The effect of stress upon the thyroid is difficult to interpret because it depends largely upon the species examined and even upon different genetic predispositions within the same species. In rats, localized frostbite caused a loss of colloid from the thyroid concurrent with typical G.A.S. changes in the adrenals and other organs; furthermore, a variety of stressors decreased the uptake of radioiodine as indicated by radioautographic studies in this species. Hence, it was concluded that stress decreases TTH secretion.

However, it has been claimed that, during stress, radioiodine uptake by the thyroid does not give a specific indication of thyroid activity, since stress and cortisone increase the renal clearance of iodine. On the other hand, a drop in radioiodine is evident even after adrenalectomy, which further strengthens the view that stress does, in fact, usually diminish TTH secretion.

It has been claimed that transection of the pituitary stalk reduces the effect of nervous and emotional stressors upon the thyroid and adrenal cortex, without noticeably affecting that of surgical trauma or of large doses of EP. These findings were considered to support the concept that neurogenic and systemic stressors act upon the pituitary through distinct mechanisms.

The problem is further complicated by the observation that, in general, stressors decrease the thyroxin-binding capacity of blood proteins. In man, stress may either raise or diminish PBI, depending upon conditioning factors which have not yet been clarified.

In certain strains of wild rabbits, fear can cause "stress thyrotoxicosis" with histologic signs of thyroid hyperactivity, a fact to which we shall return in the section on Diseases of Adaptation.

According to the concept of a "shift in pituitary hormone secretion" during stress, it might be expected that increased ACTH production is associated with a diminution in the production of TTH, but in fact this is not always the case; hence, at this time, it is not yet possible to formulate any general laws concerning this problem. However, recent radioimmunoassays performed by our group suggest that, in the rat, acute stress causes an increase in ACTH concurrently with a decrease in the STH, LTH and LH concentration of the blood.

Thyroid

(See also our earlier stress monographs, p. xiii)

Herrington, L. P., Nelbach, J. H.: "Relation of gland weights to growth and aging processes in rats exposed to certain environ-

mental conditions." *Endocrinology* 30: 375-386 (1942). A37,641/42

Rats exposed to heat, noise, air blasts, vibration and other stressors exhibited a variety of organ changes similar to those caused by feeding excessive amounts of thyroid extract. "These results should be considered in

relation to Selye's work on the alarm reaction. Our experiments did not involve the extremes of stimulation characteristic of Selye's work, but some relationship is evident. In both the thyroid group and disturbed group the adrenal weights are greater and testicular weights are less, which agrees with Selye's findings. The reactions specific for the thyroid group involve an increase in heart and pituitary weights similar to that seen in the animals of the 65° and 95° temperature group. The disturbed group differ from the common pattern chiefly in the markedly reduced pituitary weight, and a less conspicuous reduction in prostatic weight. The important differences between the thyroid group and the disturbed group are probably associated with the use of thyroid feeding in one group."

Zenow, Z. I.: "Über Veränderungen im endokrinen System bei experimenteller örtlicher Erfrierung" (Changes in the endocrine system caused by experimental localized frostbite). *Virchows Arch. [Pathol. Anat.]* **312**: 486-500 (1944). B28,100/44

In rats, localized frostbite from cooling the tails causes typical G.A.S. changes, with an initial depletion and subsequent increase in adrenocortical lipids, discharge of medullary EP, and loss of colloid from the thyroid.

Bogoroch, R., Timiras, P.: "The response of the thyroid gland of the rat to severe stress." *Endocrinology* **49**: 548-556 (1951). B59,195/51

In rats, various stressors (formalin, spinal cord transection, muscular exercise) depressed the uptake of ^{131}I by the thyroid, as indicated by radioautographic studies. "It was suggested that stress caused a decrease or suppression of thyrotrophic stimulation."

Hetzl, B. S., Haba, D. S., de la, Hinkle, L. E.: "Life stress and thyroid function in human subjects." *J. Clin. Endocrinol. Metab.* **12**: 941 (1952). B71,949/52

In man, various stressful situations may cause sharp rises or falls in PBI.

Kracht, J., Kracht, U.: "Zur Histopathologie und Therapie der Schreckthyreotoxikose des Wildkaninchens" (The histopathology and therapy of fright thyrotoxicosis in wild rabbits). *Virchows Arch. [Pathol. Anat.]* **321**: 238-274 (1952). B68,863/52

In some strains of wild rabbits, fear induced by a pursuing dog or man causes "stress thyrotoxicosis" with histologic signs of thyroid hyperactivity and exophthalmos.

Wase, A. W., Repplinger, E.: "The effect of thermal burns on the thyroid activity of the rat." *Endocrinology* **53**: 451-454 (1953).

B87,006/53

Review of earlier literature showing that under certain circumstances stressors may produce either hyper- or hypothyroidism. Skin burns reduce the radioiodine uptake of the rat's thyroid during the first four hours.

Kracht, J.: "Fright-thyrotoxicosis in the wild rabbit, a model of thyrotrophic alarm-reaction." *Acta Endocrinol. (Kbh.)* **15**: 355-367 (1954).

B93,815/54

In certain species of wild rabbits frightened by man or dog, an atypical G.A.S. develops. "According to Selye's General Adaptation Syndrome, 3 phases are to be distinguished: alarm reaction, stage of resistance and stage of exhaustion. The adrenal cortex of the wild rabbit is unaffected by this special type of stress. During an alarm reaction the increase of thyrotrophic hormone implies an ACTH-stop, which can only be acutely interrupted by additional stressors such as histamine, adrenaline, formalin and ACTH or continued specific or nonspecific infections."

Harris, G. W.: "The reciprocal relationship between the thyroid and adrenocortical responses to stress." In: Wolstenholme, G. E. W. and Cameron, M. P., *Ciba Foundation Colloquia on Endocrinology*, Vol. VIII, pp. 531-550. London: J and A Churchill, 1955.

C3,662/55

Review of the literature indicating that a variety of stressors (typhoid vaccine, trauma, fasting, cold, heat, formalin, spinal cord transection, anoxia, starvation, tourniquet shock) decrease the uptake of radioiodine by the rat thyroid although they simultaneously increase ACTH secretion. However, radioiodine uptake by the thyroid during stress does not give a specific indication of thyroid activity, since stress and cortisone enhance the renal clearance of iodine and thus may lead to an apparent decrease in thyroid uptake because less radioiodine is available. Animals in which the adrenals are denervated or removed (while they are maintained on a constant cortisone regime) also show a similar response, and hence it is assumed that "the inhibition of thyroid activity seen after exposure to stress is due to a decreased secretion of pituitary thyrotrophic hormone."

Macchitella, E., Confortini, P.: "Studio sulle ustioni. III. Sulle modificazioni istologiche della tiroide in corso di ustione. (Ricerca sperimentale)" (Histologic modifi-

cations of thyroid in burns [experimental study]). *Chir. Patol. Sper.* **3**: 936-950 (1955). C10,798/55

Burman, L. M.: "Effect of stress on histochemical changes in the thyroid gland." *Fiziol. Zh.* **18**: 332-338 (1972) (Ukrainian). J19,873/72

In rats, histochemical changes indicative of thyroid hyperactivity were noticed during the first hours after a burn, and lasted for several days.

Reklewska, B., Tomaszevska, L., Kaciuba-Uścińska, H., Kożłowski, S.: "Changes in the thyroid and adrenal glands during prolonged immobilization of rats." *Bull. Acad. Pol. Sci. [Biol.]* **20**: 685-689 (1972). H80,415/72

Nvota, J., Lamošová, D., Fáberová, A.: "Critical periods in the development of chicks." *Physiol. Bohemoslov.* **22**: 337-343 (1973). J21,555/73

The stress of restraint during a critical period of about three to four weeks after hatching produced a maximal decrease in thyroid activity in adulthood and a significant drop in the BMR of the chick. The critical phase for regulation of the function of the pituitary-adrenal and pituitary-gonad axis was found to be the period between the 15th and 21st day after hatching. Exposure to stress in this phase caused a significantly greater reaction of the adrenals to stress situations in the adult hens and significantly stimulated sexual maturation (egg-laying)."

Vazquez, R.: "The thyroid gland morphology of cats subjected to hunger and thirst." *Acta Anat. (Basel)* **89**: 70-79 (1974). J16,287/74

Histologic and histochemical examination suggests hyperactivity of the thyroid in cats subjected to ten to twenty-one days of fasting. The literature on thyroid changes during stress is surveyed.

Woeber, K. A., Ingbar, S. H.: "Interactions of thyroid hormones with binding proteins." In: Greep, R. O. and Astwood, E. B., *Handbook of Physiology. Section 7. Endocrinology*, Vol. III, pp. 187-196. Washington, D.C.: American Physiological Society, 1974. E10,592/74

An extensive review of the literature suggests that acute or chronic illness and surgical stress are commonly though not invariably associated with a pronounced decrease in the thyroxine-binding capacity of prealbumin, and sometimes with a moderate diminution of thyroxine-binding globulin.

Sex Organs (including Pregnancy and Lactation)

The effect of stress upon the functions of sex organs is arbitrarily discussed here under Morphology in order not to duplicate many facts referring to the functional con-

sequences of structural changes. Likewise included in this section are effects upon pregnancy and lactation, but stillbirth and malformations in the embryo will be discussed under Age in Chapter II.

Chronic stress causes gonadal atrophy and a diminution of sexual activity in males and females of most species so far examined. It also induces menstrual disturbances in women and impotence in men. It retards the onset of puberty, diminishes fertility, and may interfere with the maintenance of gestation or lead to malformations in the embryos.

During lactation, stress diminishes milk secretion; on the other hand, it has been claimed that "the stress of parturition has a significant role in the post-partum initiation of lactogenesis." In rats, the blockade of ovulation produced by pentobarbital can often be reversed by the stressor effect of cardiac puncture, which allegedly causes an LH discharge. A few additional observations also suggest that under certain conditions at least acute stressors can elicit a sudden release of gonadotropic hormones from the pituitary. However, the vast majority of findings support the view that—in consonance with the "pituitary-shift" theory—the increased secretion of ACTH, which is indispensable for the maintenance of life during prolonged emergencies, interferes with the continuous simultaneous production of other pituitary hormones, including gonadotropins.

Sex Organs (including Pregnancy and Lactation)

(See also our earlier stress monographs, p. xiii)

Selye, H.: "The effect of adaptation to various damaging agents on the female sex organs in the rat." *Endocrinology* 25: 615-624 (1939). A18,343/39

In the rat, ovarian atrophy and almost permanent anestrus are produced by various stressors (excessive muscular exercise, inadequate diets, toxic doses of different drugs). Ovarian atrophy during the G.A.S. may be just as severe as that elicited by hypophysectomy and associated with "wheel cell" formation. "It appears that in cases of emergency, the pituitary tends to produce more adrenotropic and less gonadotropic hormone than under normal conditions. The reason for this is probably that, under such conditions, an abundant supply of the life-maintaining principle of the adrenal cortex is a more imminent necessity than the preservation of normal sex function."

Dohan, F. C.: "Effect of low atmospheric pressure on the adrenals, thymus and testes of rats." *Proc. Soc. Exp. Biol. Med.* 49: 404-408 (1942). A37,744/42

"Rats exposed to low atmospheric pressure for more than 2 days exhibited a significant increase in adrenal weight and a significant

decrease in the weight of the thymus and testes. This pattern is similar to that found following other forms of stress." These observations are in consonance with the "pituitary-shift" theory.

Walton, A., Uruski, W.: "The effects of low atmospheric pressure on the fertility of male rabbits." *J. Exp. Biol.* 23: 71-75 (1946). B40,070/46

Gantt, W. H.: "Disturbances in sexual functions during periods of stress." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 1030-1050. Baltimore: Williams & Wilkins, 1950.

B51,958/50

Discussion of sexual arousal as a stressor agent and conversely as a functional variable readily influenced by stress.

Sager, O., Badenschi, G., Cotăescu, E. Roth, R. R.: "Acțiunea electroșocului asupra glandelor cu secreție internă" (Effects of electroshock on endocrine gland secretion). *Bull. Sci. Acad. R.P.R. Roumanie, Sci. Méd.* 2: 651-659 (1950) (Roumanian).

G99,776/50

In man, electroshocks produce ACTH secretion, eosinopenia and lymphopenia, reaching a maximum within about four hours. Repeated electroshocks may also cause menstrual disturbances in women and impotence

in men. All these effects are ascribed to the G.A.S.

Mandl, A. M., Zuckerman, S.: "The reaction of the ovaries and adrenal glands of female rats to ovarian and muscle homografts." *J. Endocrinol.* 7: 344-348 (1951).

B63,009/51

In rats, homografts of ovarian or muscle tissue caused adrenal and ovarian enlargement. The adrenals (but not the ovaries) were also hypertrophied following Avertin anesthesia. The possibility is considered that these reactions may be manifestations of stress.

Mandl, A. M., Zuckerman, S.: "Factors influencing the onset of puberty in albino rats." *J. Endocrinol.* 8: 357-364 (1952).

B75,210/52

In rats, exposure to cold accelerates the vaginal opening (a sign of puberty), whereas rough handling and a high-protein diet have no such effect. Possibly, certain types of "nonspecific 'stress'" may bring about a raised output of gonadotrophin as well as of ACTH, and thus secondarily stimulate ovarian activity."

Djurišić, S.: "General adaptation syndrome and functional ovarian disorders during wartime." *Acta Med. Jugoslav.* 8: 205-228 (1954) (Serbo-Croatian). B99,192/54

Gli effetti dello stress e della somministrazione di ACTH sull'apparato genitale femminile delle ratte normali e stimizzate" (Importance of thymus in adaptation syndrome; effects of stress and of adrenocorticotrophic hormone on female genitals of normal and stimulated rats). *Folia Endocrinol.* (Roma) 8: 525-543 (1955). C8,681/55

In rats, "typical manifestations of the 'alarm reaction' by the cold stress (such as anestrus ovulations, corticoids-estrogens antagonism, fatty infiltration of the liver etc.) are clearly augmented and prolonged by thymectomy so that the adaptation process becomes delayed."

Bickers, W.: "Uterine contraction patterns. Effects of psychic stimuli on the myometrium." *Fertil. Steril.* 7: 268-275 (1956).

J25,121/56

"The clinical opinion long held that the emotions affect uterine physiology and play an important role in infertility has been

shown to have a valid basis in demonstrable physiologic changes occurring in the human uterus under the impact of fear, pain, and disappointment."

Joël, C. A., Lancet, M.: "The question of a psychogenic factor in some cases of primary amenorrhea." *J. Clin. Endocrinol. Metab.* 16: 909-911 (1956). C19,340/56

"Psychogenic stress" may cause amenorrhea in women.

Arvay, A., Nagy, T., Kovács-Nagy, S.: "Die Wirkung der auf die Sinnesorgane ausgeübten extrem starken Reize auf die Funktion und Morphologie des Ovars" (Functional and morphologic changes of the ovary caused by very strong stimulation of the sense organs). *Z. Geburtshilfe Gynaekol.* 147: 371-388 (1956). C31,632/56

In rats, exposure to intense sound, light or electric stimulation eventually produces degenerative changes in the ovary which may be associated with continuous estrus or diestrus.

Christian, J. J.: "A review of the endocrine responses in rats and mice to increasing population size including delayed effects on offspring." *Naval Med. Res. Inst.* August 6, 1957, pp. 443-462. C53,409/57

Rats and mice living under crowded conditions show many manifestations of stress, including a decrease in fertility which may act as a regulator of population density to maintain an optimal level. Crowding can also cause lasting changes in the offspring of surviving females, probably due to lactational deficiencies.

Sackler, A. M., Weltman, A. S., Bradshaw, M., Jurtschuk, P. Jr.: "Endocrine changes due to auditory stress." *Acta Endocrinol.* (Kbh.) 31: 405-418 (1959).

C71,159/59

Repeated exposure of rats to strong auditory stimulation causes adrenal enlargement, ovarian atrophy and diminution in the weight of the uterus and liver. Food consumption is also markedly reduced.

Soiva, K., Grönroos, M., Rinne, U. K., Näätänen, E.: "The effect of psychic and painful stimuli on the reproductive organs of the female rat." *Acta Obstet. Gynecol. Scand.* 38 Supp. 4: 22 (1959). C96,937/59

Grönroos, M., Kauppila, O.: "Hormonal-cyclic changes in rats under normal conditions and under stress as revealed by vaginal

smears after Shorr staining." *Acta Endocrinol.* (Kbh.) **32**: 261-271 (1959).

C76,461/59

Observations on rats concerning changes in vaginal estrus during the G.A.S.

Zondek, B., Tamari, I.: "Effect of audiogenic stimulation on genital function and reproduction." *Am. J. Obstet. Gynecol.* **80**: 1041-1048 (1960). D4,871/60

"Exposure to stimulation of the auditory organs in mature rats stimulates the anterior pituitary gonadotropic function, manifested by prolonged or persistent estrus, enlargement of the ovaries, and increase of the corpora lutea in number and size." In rabbits, enlargement of the ovaries and follicle hematomas with corpus luteum formation and sometimes galactorrhea are noted. The stimulating effect of auditory stimuli on female genital function is in contrast to the inhibitory action on fertility. The stressor effect of sound can also interrupt pregnancy.

Fitko, R.: "Contemporary view of cystic ovaries and nymphomania in animals." *Med. Weteryn.* **16**: 407-415 (1960) (Polish).

D1,235/60

Cystic ovaries and nymphomania may occur in various domestic animals as a consequence of stress.

Abramson, J. H., Singh, A. R., Mbambo, V.: "Antenatal stress and the baby's development." *Arch. Dis. Child.* **36**: 42-49 (1961). D4,534/61

"A prospective study of Indian expectant mothers in Durban revealed a relationship between emotional stress during pregnancy and a low level of motor development in the infant."

D61,414/61

The stress-induced block of milk ejection in guinea pigs can be largely inhibited by tranquilizers.

Vandekerckhove, D.: "Dosage de l'acide désoxyribonucléique et karyométrie au niveau du corps jaune de la lapine pseudogravide. II. L'influence de l'agression opératoire" (Determination of desoxyribonucleic acid and karyometry in the corpus luteum of the pseudopregnant rabbit. II. The influence of operative stress). *Ann. Endocrinol.* (Paris) **23**: 605-607 (1962). D41,344/62

In pseudopregnant rabbits, traumatic stress

decreased the DNA content of corpus luteum cells.

Eleftheriou, B. E., Bronson, F. H., Zarrow, M. X.: "Interaction of olfactory and other environmental stimuli on implantation in the deer mouse." *Science* **137**: 764 (1962).

D30,851/62

In recently inseminated deer mice, various changes in the physical environment can inhibit implantation. [It remains to be shown whether this is a nonspecific stress effect (H.S.).]

Weir, M. W., DeFries, J. C.: "Blocking of pregnancy in mice as a function of stress." *Psychol. Rep.* **13**: 365-366 (1963).

E39,863/63

"Stressful situations during the early stages of pregnancy, including handling, resulted in marked reduction in the number of litters obtained from two highly inbred strains of mice."

Bruce, H. M.: "A comparison of olfactory stimulation and nutritional stress as pregnancy-blocking agents in mice." *J. Reprod. Fertil.* **6**: 221-227 (1963). G1,344/63

In mice, olfactory stimulation and "nutritional stress" act as distinct pregnancy-blocking agents.

Meites, J., Nicoll, C. S., Talwalker, P. K.: "The central nervous system and the secretion and release of prolactin." *Adv. Neuroendocrinol.* **238-277** (1963). G17,019/63

Review on the role of the CNS in the secretion and release of LTH. Certain stressful stimuli can induce mammary growth or lactation in women. The mechanism of this response is not understood.

Schmidt, A. L. C., Christiaans, A. P. L.: "An oestrogenic effect as a component of the stress syndrome." *Acta Endocrinol.* (Kbh.) **46**: 421-439 (1964). F14,822/64

Stress induced by swimming increased the number of cornified cells in the vaginal smears of ovariectomized but not of adrenalectomized rats. Hypophysectomy usually failed to prevent this effect. The authors conclude that "stress induces a release of oestrogens or oestrogenic substances from the adrenal cortex. The most important pathway seems to follow the sympathetic nervous system. As a hypothesis the pathway is suggested to proceed from the hypothalamus via the sympathetic tissue to the adrenal."

Dickson, A. D.: "Delay of implantation in

super-ovulated mice subjected to crowded conditions." *Nature* **201**: 839-840 (1964).
F9,766/64

Ouellette, R., Perrault, H. J., Dugal, L. P.: "Effet du froid sur le testicule endocrinien: chronologie des événements" (Effects of cold on the endocrine testis: chronology of events). *Rev. Can. Biol.* **24**: 7-21 (1965).

F42,194/65

In male rats, "a time study of the response of the sexual accessories reveals the succession of events as distinct phases related to the duration of the stress and reminiscent of the three stages of the General Adaptation Syndrome."

Hahn, E. W., Hays, R. L.: "Modification of the incidence of mating in rats by stimulation with a short air blast." *Psychol. Rep.* **16**: 862-864 (1965).

J23,149/67

Sandler, B.: "Emotional stress and infertility." *J. Psychosom. Res.* **12**: 51-59 (1968).

J22,399/68

"The term 'stress' is here taken to mean 'the internal or resisting force brought into being in the human organism by interaction with the environment.'... There is much evidence of the causal relationship between stress and infertility in the common observation that a 'cure' of the disorder, after years of sterility, has followed very diverse events which could have had no bodily effect on the patient. For example, a patient telephones for an appointment and conception occurs before the consultation; or conception occurs after a semen analysis, even before the results are known; after a simple vaginal examination; after general reassurance; after putting a name down for adoption."

Huston, T. M., Subhas, T.: "The influence of environmental temperature upon adrenal activity of bursectomized chicks." *Poultry Sci.* **47**: 1760-1763 (1968).

J23,073/68

The testes of young cockerels kept at 30°C are larger than those of controls housed at 8°C.

Matsumoto, S., Igarashi, M., Nagaoka, Y.: "Environmental anovulatory cycles." *Int. J. Fertil.* **13**: 15-23 (1968).

G60,304/68

Psychic trauma may produce anovulatory cycles in women.

Schuster, D. H., Schuster, L.: "Study of stress and sex ratio in humans." *Proc. 77th Ann. Conv. APA*, pp. 335-336 (1969).

G69,737/69

"Our theory can be phrased physiologically, the male parent when under stress inhibits the motility or viability of male sperm. Conversely, the female parent when under stress inhibits the motility or viability of female sperm prior to fertilization."

Palti, Z.: "Psychogenic male infertility." *Psychosom. Med.* **31**: 326-330 (1969).

J22,423/69

In men, infertility is frequently due to prolonged emotional stress. It usually results from "impotence, sham ejaculation, retrograde ejaculation and oligospermia."

Gilbert, F. F., Bailey, E. D.: "Visual isolation and stress in female ranch mink particularly during the reproductive season." *Can. J. Zool.* **47**: 209-212 (1969).

J20,525/69

"Visual isolation is apparently more stressful to female mink during the anoestrous period but reduces stress during oestrus and pregnancy. The increased adrenal steroid output of control mink as part of the stress syndrome during the critical reproductive period might be responsible for increased *in utero* losses. But increased adrenocortical output associated with the stress of *long term* visual isolation might result in insufficient gonadal stimulation resulting in fewer pregnancies."

James, W. H.: "The effect of maternal psychological stress on the foetus." *Br. J. Psychiatry* **115**: 811-825 (1969).

G67,988/69

"There is good evidence that severe emotional stress and strong sensory stimuli cause embryonic resorption and stillbirth in some mammals." The risk of stillbirth or death within the first month is above normal in illegitimate infants and in those whose father is absent through death, divorce, desertion and so on. There is no firm evidence that either anencephaly or mongolism is caused by maternal psychogenic stress.

Harrison, R. J., Boice, R. C., Brownell, R. L. Jr.: "Reproduction in wild and captive dolphins." *Nature* **222**: 1143-1147 (1969).

H13,797/69

Among various types of dolphins, ulceration of the forestomach occurred during captivity, while the number of pregnancies decreased considerably.

Singh, K. B., Rao, P. S.: "Studies on the polycystic ovaries of rats under continuous auditory stress." *Am. J. Obstet. Gynecol.* **108**: 557-564 (1970).

G78,701/70

In rats, continuous auditory stress can elicit polycystic ovaries with inhibition of corpus luteum formation, and thereby interfere with reproduction.

Billinson, M. R.: "Prematurity and low birth weight litters: a mechanism elicited by thermal stress." *Am. J. Obstet. Gynecol.* **108**: 970-974 (1970). H45,391/70

In rats, "thermal stress" increases 5-HT excretion, which may be accompanied by premature delivery or low birth weight of the litters.

Machida, T.: "Luteinization of ovarian transplants in gonadectomized male and female rats under stressful conditions and its relation to sexual differentiation of the hypothalamus." *Endocrinol. Jap.* **17**: 189-193 (1970). H31,731/70

Nvota, J., Lamošová, D., Fáberová, A.: "Critical periods in the development of chicks." *Physiol. Bohemoslov.* **22**: 337-343 (1973).

J21,555/73

The stress of restraint during a critical period of about three to four weeks after hatching produced a maximal decrease in thyroid activity in adulthood and a significant drop in the BMR of the chick. "The critical phase for regulation of the function of the pituitary-adrenal and pituitary-gonad axis was found to be the period between the 15th and 21st day after hatching. Exposure to stress in this phase caused a significantly greater reaction of the adrenals to stress

situations in the adult hens and significantly stimulated sexual maturation (egg-laying)."

D'Souza, F., Martin, R. D.: "Maternal behaviour and the effects of stress in tree shrews." *Nature* **251**: 309-311 (1974).

J23,295/74

In tree shrews, the noise of a fire bell accelerates the suckling rhythm but decreases the quantity of milk given over a forty-eight-hour period. More severe stress causes cannibalism.

Porter, J. C.: "Hormonal regulation of breast development and activity." *J. Invest. Dermatol.* **63**: 85-92 (1974). H89,237/74

Review on the effect of hormones and stressors upon lactogenesis. "The possibility that the stress of parturition has a significant role in the postpartum initiation of lactogenesis is provocative" (77 refs.).

Paris, A. L., Ramaley, J. A.: "Adrenogonadal relations and fertility: the effects of repeated stress upon the adrenal rhythm." *Neuroendocrinology* **15**: 126-136 (1974).

H91,877/74

In female mice housed near males to maintain a normal estrous cycle, restraint reversed the daily plasma corticosterone rhythm, with peaks during the midpoint of the light interval rather than shortly after the onset of darkness. Old females showing no regular estrus exhibited no twenty-four-hour corticosterone rhythm before stress. After restraint had been discontinued, the mice

developed a daily rhythm. It was concluded that the presence of an adrenal rhythm is associated with fertility, its absence with infertility.

Inoue, S., Nagasaki, H., Iriki, M.: "Total sleep deprivation and weight increases of the reproductive organs in male rats." *Endocrinol. Jap.* **21**: 283-286 (1974).

H92,991/74

In rats, long-term sleep deprivation in a cage in which they were continuously forced to move in order to avoid electric shocks caused hypertrophy of the adrenals, testes, ventral prostate and seminal vesicles. "It is supposed that either the sleep deprivation per se or stressful conditions accompanied with the treatment caused a hypersecretion of hypophyseal and testicular hormones." [It is unusual for chronic stress to cause hypertrophy of the sex organs, and these observations appear to be incompatible with the "pituitary-shift" theory (H.S.).]

Pancreas

Acute involution of the excretory pancreatic tissue was observed in the first experiments on the alarm reaction in rats. It was noted then, and has often been confirmed since, that the pancreatic acini immediately surrounding the Langerhans islets make the latter readily discernible by the naked eye as white spots in the atrophic grayish and transparent parenchyma. The formation of these "halos" of undamaged exocrine tissue has still not been explained. The so-called "postoperative pancreatitis" is also a related phenomenon.

More recently it was found that systemic stressors such as restraint can also cause degranulation of the β -cells in the islets themselves. This change is allegedly also characteristic of stress.

Pancreas

(See also our earlier stress monographs, p. xiii)

Selye, H.: "Studies on adaptation." *Endocrinology* **21**: 169-188 (1937). 38,798/37

First detailed description of the three stages of the G.A.S. and the concept of "adaptation energy," with an extensive and illustrative characterization of the morphologic lesions produced by stress (especially in the hypophysis, adrenals, thymicolymphatic apparatus, pancreas and gastrointestinal tract), and its effect upon inflammation (anaphylactoid edema).

Théret, C.: "La neuro-sécrétion des complexes neuro-insulaires du pancréas. Ses

vibrations sous l'action de stress expérimentaux" (The neurosecretion of the neuroinsular complexes of the pancreas. Its variations under the effects of experimental stress). *Ann. Endocrinol. (Paris)* **22**: 312-322 (1961).

D8,823/61

The vegetative neurons associated with Langerhans' islands of various species are the seat of a neurosecretion of nucleolar origin which increases in intensity during stress produced by any kind of agent. [Excellent color photographs (H.S.).]

Barkalaya, A. I.: "Nature of reaction of the insular apparatus of the pancreas in chronic stress." *Probl. Endokrinol.* **14** No. 6: 71-74 (1968) (Russian). H6,534/68

Observations on the rat suggest that, "in the mechanism of reaction of the islands of Langerhans to stress, a definite role is played by activated secretion of the hormones of hypophyseal-adrenocortical system and their hyperglycemic effect."

Moritz, V., Baumann, R., Hecht, K., Poppe, M., Treptow, K.: "Relationen zwischen neurotisch induzierter Blutdruckdysregulation und Granulagehalt der Pankreas- β -Zellen bei der Albinoratte" (Relation between neurosis-induced blood pressure dysfunction and granule content in the pancreatic β -cells of the albino rat). *Acta Biol. Med. Ger.* **30**: 231-240 (1973). J7,756/73

Under certain circumstances, repeated restraint can cause degranulation of the pancreatic β -cells in the rat. This change is ascribed to stress.

Pineal Gland

The few available data on morphologic changes in the pineal gland during stress will be discussed in the chapter on Theories together with other evidence of pineal participation in the G.A.S.

Thymicolumphatic and Hematopoietic Organs

Thymus involution after severe burns was noted in the nineteenth century, and "accidental thymus involution" in children suffering from various diseases and intoxications was likewise described much before the alarm reaction. However, it was not until the formulation of the G.A.S. concept that thymicolumphatic involution was recognized as part of the nonspecific reaction to any stressor of sufficient intensity.

Histologically, the response of the thymus to stressors is characterized primarily by a disintegration of the thymocytes, with an "inversion of the thymus pattern," in that the majority of the remaining thymocytes migrate from the cortex into the medulla. The epithelioid elements in the medulla of the thymus tend to proliferate during stress, and cystic Hassall's corpuscles are frequently noted.

In the lymph nodes, the first cells to undergo degeneration are the relatively immature lymphocytes in the germinal centers. Similar changes are produced by ACTH and glucocorticoids; hence, the thymicolumphatic alterations characteristic of stress presumably are mediated through the discharge of the latter hormones. This view is further substantiated by the inhibitory effect exerted by adrenalectomy upon stress-induced thymicolumphatic involution.

The lymphatic elements in the spleen, intestine, and Bursa of Fabricius of birds respond essentially in the same manner as do those of the thymus and lymph nodes.

The possible immunologic significance of thymus involution produced by stress in adults has not yet been ascertained, but it would certainly deserve attention.

Finally, it is worth mentioning that although the stress-induced thymicolumphatic involution is undoubtedly mediated through the secretion of corticoids, the actions of the latter can be conditioned by other factors. Even in adrenalectomized animals maintained on a standard dose of glucocorticoids which in itself causes little or no thymus involution, subsequent exposure to stressors results in a pronounced atrophy of this organ.

The hemopoietic tissue usually undergoes transient hyperplasia during stress but its lymphatic elements participate in the generalized atrophy and involution of the thymicolumphatic organs in general. The granulocytes of the bone marrow tend to be discharged during stress, which may be partly responsible for the characteristic polynuclear glucocytosis after exposure to stressors.

Thymicolumphatic and Hematopoietic Organs

(See also our earlier stress monographs, p. xiii)

Bardeen, C. R.: "A study of the visceral changes in extensive superficial burns." *J. Exp. Med.* **2**: 501-514 (1897).

B19,954/1897

Autopsies on several patients who died from severe skin burns revealed gastric or duodenal ulcers and thymicolumphatic atrophy as well as hepatic and renal changes. Patients who died during the first few hours showed predominantly edematous lymphatic organs. "These lesions of the lymphatic tissue furnish most important additional evidence of a toxæmia after superficial burns."

Hammar, J. A.: "Beiträge zur Konstitutionsanatomie, VI." (Studies on constitutional anatomy, VI). *Z. Angew. Anat. Konstit. Lehre* **4**: 1-107 (1918). 50,856/18

Meticulous histologic studies on the human thymus, with special sections on the so-called "accidental involution" elicited by various dietary deficiencies, bacterial infections, snake venoms and other damaging agents. This is probably the first systematic monograph on the subject.

Selye, H.: "Studies on adaptation." *Endocrinology* **21**: 169-188 (1937). 38,798/37

First detailed description of the three stages of the G.A.S. and the concept of "adaptation energy," with an extensive and illustrative characterization of the morphologic lesions produced by stress (especially in the hypophysis, adrenals, thymicolumphatic apparatus, pancreas and gastrointestinal tract), and its effect upon inflammation (anaphylactoid edema).

Dohan, F. C.: "Effect of low atmospheric pressure on the adrenals, thymus and testes of rats." *Proc. Soc. Exp. Biol. Med.* **49**: 404-408 (1942). A37,744/42

"Rats exposed to low atmospheric pressure for more than 2 days exhibited a significant increase in adrenal weight and a significant decrease in the weight of the thymus and

testes. This pattern is similar to that found following other forms of stress." These observations are in consonance with the "pituitary-shift" theory.

Dougherty, T. F., White, A.: "An evaluation of alterations produced in lymphoid tissue by pituitary-adrenal cortical secretion." *J. Lab. Clin. Med.* **32**: 584-605 (1947) (93 refs.). B18,513/47

Kendler, J., Harry, E. G.: "Systemic Escherichia coli infection as a physiological

stress in chickens." *Res. Vet. Sci.* **8**: 212-218 (1967). J23,505/67

In chickens, *coli* septicemia caused a characteristic stress syndrome with involution of the spleen and bursa, associated with increased bursal β -glucuronidase.

Goldstein, G., MacKay, I. R.: "The thymus in systemic lupus erythematosus: a quantitative histopathological analysis and comparison with stress involution." *Br. Med. J.* May 20, 1967, pp. 475-478. F81,223/67

In man, stress involution reduced the thymus cortex and caused the appearance of epithelial cell aggregates in the medulla with cystic Hassall's corpuscles. In lupus erythematosus, there was complete cortical atrophy due to lymphocyte depletion and disorganization of the medulla, which was largely occupied by epithelial cell aggregates and cystic Hassall's bodies. The number of plasma cells increased and germinal centers were present in two cases. "Our interpretation is that the thymus in systemic lupus erythematosus is a target organ. There is histological evidence of extreme stress involution and of an autoimmune reaction which could augment changes usually associated with stress involution."

Huston, T. M., Subhas, T.: "The influence of environmental temperature upon adrenal activity of bursectomized chicks." *Poultry Sci.* **47**: 1760-1763 (1968). J23,073/68

Although earlier experiments had shown that severe stress causes involution of the bursa in chicks, moderate cold has no such effect. In bursectomized chicks, adrenal ascorbic acid content diminishes, particularly after exposure to stress.

Zimin, I. I.: "Changes in hematopoiesis in rats under stress." *Biull. Éksp. Biol. Med.* **68**: No. 7: 19-22 (1969) (Russian). Engl. trans.: *Bull. Exp. Biol. Med.* **68**: 715-717 (1969). J24,918/69

"In rats under stress [repeated electroshocks] a decrease in the number of cells in the lymphoid organs was accompanied by an increase in the number of lymphocytes in the bone marrow. The total number of cells in the thymus and spleen rose after an initial decrease. The number of lymphocytes in the bone marrow fell, after an initial increase, to its original level, and this was accompanied by activation of granulocytopoiesis. More prolonged exposure to stress led to a decrease in the total number of myelokaryocytes, re-

peated involution of the thymus, and lymphocytopenia."

Lucas, D. R., Peakman, E. M.: "Ultrastructural changes in lymphocytes in lymphnodes, spleen and thymus after sublethal and supralethal doses of x-rays." *J. Pathol.* **99**: 163-169 (1969). G72,305/69

The EM changes induced by ionizing irradiation in various lymphatic organs are described and well illustrated.

Pora, E. A., Toma, V.: "L'involution normale et accidentelle du thymus" (Normal and accidental thymus involution). *Ann. Endocrinol.* (Paris) **30**: 519-531 (1969). G72,660/69

J22,357/70

Review of the stress syndrome with special emphasis upon the thymic and splenic involution produced by electroshock in rats.

Gorizontov, P. D., Belousova, O. I., Zimin, I. I.: "Role of the adrenal glands in hematopoietic organ changes in the beginning period of the stress reaction." *Patol. Fiziol. Éksp. Ter.* **14** Nos. 3-4: 38-44 (1970) (Russian).

J21,367/70

In rats, adrenalectomy failed to prevent the elevation of lymphocyte counts in bone marrow and the liberation of mature lymphocytes into the blood following exposure to stressors (e. g. electroshock). However, it depressed the activation of myelopoiesis normally seen during stress. "The authors claim that migration of lymphocytes into the bone marrow and mobilization of granulocyte reserves of the bone marrow bear the character of an emergency reaction, primarily conditioned by altered tone of the sympa-

thetic nervous system, whereas activation of myelopoiesis depends upon the action of corticosteroids."

Oksanen, A.: "Multilocular fat in thymuses of rats and mice associated with thymus involution: a light- and electronmicroscope and histochemical study." *J. Pathol.* **105**: 223-226 (1971). G89,299/71

Various stressors (formaldehyde, starvation, forced exercise) cause the appearance of both brown multilocular and common white monolocular fat in the involuting thymuses of the mouse and rat. The associated enzyme histochemical and EM changes are also described.

Gelfand, D. W., Goldman, A. S., Law, E. J., MacMillan, B. G., Larson, D., Abston, S., Schreiber, J. T.: "Thymic hyperplasia in children recovering from thermal burns." *J. Trauma* **12**: 813-817 (1972). G94,744/72

In children recovering from burns, the thymus is often enlarged.

Henning, W., Möllmann, H., Kindler, J., Reisch, J., Alfes, H.: "Einfluss von synthetischen Glucocorticoiden und von Metopiron auf ketosteroidhaltige Zellen des postnatalen Kaninchenthymus" (The influence of synthetic glucocorticoids and of metopryrone on the ketosteroid-containing cells of the postnatal rabbit thymus). *Z. Zellforsch. Mikrosk. Anat.* **143**: 37-44 (1973).

J7,271/73

In rabbits, administration of glucocorticoids beginning immediately after birth causes a marked increase in NAHD-positive KS granules (Camber reaction). Metopryrone elicits an opposite response. These cells, which are regarded as eosinophils, apparently transform circulating glucocorticoids into KS, a process associated with thymus lesions characteristic of the alarm reaction.

Seifter, E., Rettura, G., Zisblatt, M., Levenson, S. M., Levine, N., Davidson, A., Seifter, J.: "Enhancement of tumor development in physically-stressed mice inoculated with an oncogenic virus." *Experientia* **29**: 1379-1382 (1973). H80,975/73

In rats, restraint by a partial body-cast produced the typical manifestations of systemic stress and at the same time increased susceptibility to the tumorigenic action of murine sarcoma virus. In the restrained animals, "there appeared to be a smaller number of small lymphocytes due to stress and a proliferation of epithelioid elements.

Hassal bodies were also involved in agreement with earlier findings of Selye. If stress or cortisone treatment result in impaired function of these structures, then the endocrine function of the thymus gland as well as its role in providing circulating cells would be disturbed." In any event, the response of the thymus during stress is assumed to increase susceptibility to the virus through interference with immune reactions.

J24,152/74

Dourov, N.: "Study of the cytoplasmic lipids in thymic involution." *Pathol. Eur.* **9**: 43-57 (1974).

J19,465/74

"A large number of lipid and small paraldehyde-fuchsinophilic granules are found in the reticular cells of the thymus cortex after the involution following a single injection of hydrocortisone. However, after regeneration nearly all these granules disappear. The ultrastructure of the reticular cells indicates their mesenchymal nature. They contain granular, vesicular and lamellar inclusions showing acid phosphatase activity. In the human species, 'inverted thymuses' contain a considerable amount of lipids in reticular cells that have phagocytized debris of thymocytes destroyed during involution. These cells contain also small paraldehyde fuchsinophil granules. In the atrophic thymuses, in infants, these are coarse, acid-resistant and auto-fluorescent. Their ultrastructure is similar to that observed in rats."

Blood Cells, Blood Volume

In most species, the alarm reaction is characterized by pronounced eosinopenia, lymphopenia and polymorphonuclear leukocytosis. These hematologic changes usually parallel the involution of the thymicolumphatic apparatus.

The lymphocytopenia characteristic of corticoid excess during stress probably results from a decreased outpouring of lymphocytes from the thymus and lymph nodes. ACTH diminishes the lymphocyte count in the thoracic duct within fifteen to thirty minutes.

ACTH and glucocorticoids produce essentially similar changes in blood count, which —like the corresponding changes elicited by stressors—are inhibited by adrenalectomy. In fact, eosinopenia and lymphopenia are used as standard indicators of glucocorticoid secretion, even in patients treated with ACTH or exposed to stressors. Curiously, hypophysectomy only partially blocks the eosinopenia induced by stress, although it does not prevent that elicited by ACTH.

As might be expected, destruction of the hypothalamic areas responsible for ACTH secretion prevents stress-induced eosinopenia.

A variety of stressors produce "*stress polycythemia*" manifested by a normal erythrocyte mass but a high hematocrit reading, secondary to contracted plasma volume. It is often associated with hypertension.

Allegedly, various stressors producing a typical G.A.S. cause plasma cell proliferation, ascribed to increased secretion of STH.

In pregnant women, aggregation of circulating neutrophils into clumps has been described as a "leukoergic phenomenon."

Several authors speak of "*stress reticulocytes*," which may be a source of erythropoietic bilirubin formation. Allegedly, in adrenalectomized mice, stressors produce a paradox lymphocytosis which cannot be prevented by splenectomy and hence is not merely the result of evacuating the splenic reservoir. A special type of "*stress lymphocyte*" has also been described, it being characterized by a large, purely basophilic cytoplasm. However, these findings, published about twenty years ago, have not been subjected to more detailed investigation in recent years.

Blood Cells, Blood Volume

(See also our earlier stress monographs, p. xiii)

Harlow, C. M., Selye, H.: "The blood picture in the alarm reaction." *Proc. Soc. Exp. Biol. Med.* **36**: 141-144 (1937).

A8,400/37

In mice and rats the alarm reaction produced by EP, formalin, cold, forced muscular exercise or traumatic shock is associated with polymorphonuclear leukocytosis and pronounced lymphopenia. These alterations are not specific and roughly parallel the involution of the thymicolumphatic apparatus. [This was the first publication on changes in the peripheral blood count caused by stress (H.S.).]

Dalton, A. J., Selye, H.: "The blood picture during the alarm reaction." *Folia Haematol.* (Leipz.) **62**: 397-407 (1939).

A31,950/39

"It appears that the so-called non-specific leukocytosis, preceded by a decrease and followed by an increase in eosinophils, is a constant feature of the alarm reaction." This view is based on personal observations on formalin-induced stress in the rat and on a survey of the literature on the hematologic effects of various agents whose stressor activity has since been recognized.

Selye, H., Dosne, C., Bassett, L., Whitaker, J.: "On the therapeutic value of adrenal cortical hormones in traumatic shock

and allied conditions." *Can. Med. Assoc. J.* **43**: 1-8 (1940). A32,768/40

During the shock phase of the alarm reaction produced by heavy formaldehyde dosage in the rat, there is hypochloremia, hypoglycemia and hemoconcentration, all of which can be at least partially inhibited by a crude cortical extract (cortin). This is even more obvious in surgical shock produced by partial hepatectomy, but here a specific effect of hepatic insufficiency could not be excluded.

Dougherty, T. F., White, A.: "Influence of hormones on lymphoid tissue structure and function. The role of the pituitary adrenotropic hormone in the regulation of the lymphocytes and other cellular elements of the blood." *Endocrinology* **35**: 1-14 (1944). A94,353/44

In mice, rats and rabbits, single injections of ACTH produce absolute lymphopenia and an increase in polymorphonuclear leukocytes. These changes are prevented by adrenalectomy and resemble those of the alarm reaction in which probably "non-specific factors cause some of their effects on lymphoid tissue through the pituitary adrenal cortex relationship, although large doses of toxic agents may have a direct action on lymphoid cells."

Elmadjian, F., Pincus, G.: "The adrenal cortex and the lymphocytopenia of stress." *Endocrinology* **37**: 47-49 (1945).

B366/45

In mice, both restraint and exposure to cold produce a typical stress lymphocytopenia.

Reinhardt, W. O., Li, C. H.: "Depression of lymphocyte content of thoracic duct lymph by adrenocorticotropic hormone." *Science* **101**: 360-361 (1945). 85,615/45

In intact but not in adrenalectomized rats, intraperitoneal or subcutaneous ACTH caused a rapid decrease of lymphocytes in the thoracic duct lymph within fifteen to thirty minutes. No such effect was obtained by pure STH or LTH. The lymphocytopenia characteristic of corticoid excess (such as occurred during stress) probably results from a reduced outpouring of lymphocytes from the thymus and lymph nodes.

Pincus, G., Elmadjian, F.: "The lymphocyte response to heat stress in normal and psychotic subjects." *J. Clin. Endocrinol.* **6**: 295-300 (1946). B1,243/46

Normal men exposed to 40.5-44.0°C at 85 to 95 percent relative humidity exhibited

marked "stress lymphocytopenia," attributed to increased corticoid secretion. "With the short-time stress employed here it is entirely likely that we are dealing with the first stage of the adaptation syndrome which involves adrenocortical hypersecretion as the result of the pituitary stimulation." By contrast, twenty out of twenty-one psychotic (mostly schizophrenic) subjects exhibited a rise in blood lymphocytes after heat exposure.

Long, C. N. H.: "Recent studies on the function of the adrenal cortex." *Bull. N.Y. Acad. Med.* **23**: 260-282 (1947).

B35,087/47

Review of the literature and personal observations concerning the lymphopenia and the "anamnestic reaction" produced by stressors and corticoids.

Pincus, G.: "Studies of the role of the adrenal cortex in the stress of human subjects." *Rec. Prog. Horm. Res.* **1**: 123-145 (1947). 98,426/47

Excellent review on the biochemical changes characteristic of the G.A.S. in man, with special reference to 17-KS excretion and blood count under the influence of circadian variations, the stresses of daily life, operating a Hoagland-Werthessen pursuit meter, flying and exposure to heat. The response of schizophrenics is abnormal in many respects, and the question is raised whether adrenal malfunction may play a pathogenic role in mental disease (20 refs.).

Gellhorn, E., Frank, S.: "Sensitivity of the lymphopenic reaction to adrenalin." *Proc. Soc. Exp. Biol. Med.* **69**: 426-429 (1948).

B28,597/48

In intact but not in adrenalectomized rats, intraperitoneal EP causes neutrophilia and lymphopenia.

Hills, A. G., Forsham, P. H., Finch, C. A.: "Changes in circulating leukocytes induced by the administration of pituitary adrenocorticotropic hormone (ACTH) in man." *Blood* **3**: 755-768 (1948). B33,083/48

In man, ACTH causes pronounced lymphopenia and eosinopenia with a moderate polymorphonuclear leukocytosis. The comparable blood count changes associated with the alarm reaction are ascribed to endogenous ACTH secretion.

Hungerford, G. F.: "Effect of epinephrine in decreasing number of circulating mononuclear leucocytes in the rat." *Proc. Soc. Exp. Biol. Med.* **70**: 356-358 (1949).

B31,654/49

EP decreases the number of circulating mononuclear leukocytes in intact and adrenomedullated rats, but does not do so after complete adrenalectomy, and only slightly after hypophysectomy.

Speirs, R. S., Meyer, R. K.: "The effects of stress, adrenal and adrenocorticotropic hormones on the circulating eosinophils of mice." *Endocrinology* **45**: 403-429 (1949).

E56,284/49

Detailed description of the determination of blood eosinophils in mice and rats as an indicator of stress. Adrenalectomy prevented the response to both rough handling and EP injections, but did not do so after treatment with adrenocortical extract. Hypophysectomy did not prevent the response to ACTH, but curiously it only partially blocked eosinopenia after stress.

Pincus, G.: "Adrenal cortex function in stress." *Ann. N.Y. Acad. Sci.* **50**: 635-645 (1949).

B37,780/49

General review on changes in adrenocortical function during stress and psychiatric illness. Special emphasis is placed upon blood sugar, blood lymphocytes, corticoids and 17-KS.

Love, W. D.: "Failure of adrenalectomy immediately following stress to prevent eosinopenia in rats." *Proc. Soc. Exp. Biol. Med.* **75**: 639-641 (1950).

B54,242/50

In rats, adrenalectomy ten minutes after EP injection does not prevent stress-eosinopenia. Apparently, ACTH and corticoid discharge occurs almost immediately following application of the stressor.

Taylor, R. H., Gross, M., Ruby, I. J.: "Nonconvulsive electrostimulation and the pituitary-adrenocortical system." *J. Nerv. Ment. Dis.* **114**: 377-383 (1951).

J8,693/51

Both convulsive and nonconvulsive electrostimulation produce marked eosinopenia even in schizophrenic patients, although earlier investigators claimed that they usually failed to show such a response. Pentothal anesthesia did not prevent this eosinopenia which was therefore not attributed to stress but to a direct action of electric current on the hypothalamus. The literature on the effect of electroshock upon blood eosinophils is reviewed (17 refs.).

Bacchus, H.: "Leukocyte response to stress in normal and adrenalectomized rats

pretreated with ascorbic acid." *Proc. Soc. Exp. Biol. Med.* **77**: 167-169 (1951).

B59,311/51

In rats, stress caused by sham adrenalectomy induces eosinopenia with polymorphonuclear leukocytosis developing within three hours. Pretreatment with ascorbic acid or adrenalectomy prevents and may even reverse the eosinopenia.

Kuhl, W. J. Jr., Ralli, E. P.: "Effect of acute stress upon blood constituents, white cells, and urine constituents in normal individuals." *Proc. Assoc. for the Study of Internal Secretions—33rd. Meeting*, p. 51. Atlantic City, N.J., 1951. Also in: *J. Clin. Endocrinol. Metab.* **11**: 776 (1951).

B58,505/51

Normal men immersed in cold water (9.5°C) for eight minutes showed: "1—A decrease in temperature (immediate, 1 and 2 hours); 2—An increase in systolic and diastolic blood pressure (immediate) and a decrease (2 hours); 3—A decrease in heart rate (1, 2 and 4 hours); 4—An increase in neutrophiles (immediate); 5—A decrease in lymphocytes (2 hours); 6—A decrease in eosinophiles (2 hours); 7—A decrease in serum chloride (immediate); 8—An increase in total proteins (immediate and 4 hours); 9—A decrease in serum water (immediate); 10—An increase in total cholesterol (4 hours); 11—An increase in the urine uric acid/creatinine ratio (2 and 4 hours)." All of these changes were significant and ascribed to stress, but no one indicator gave uniformly positive results.

Faurbye, A., Vestergaard, P., Kobbernagel, F., Nielsen, A.: "Adrenal cortical function in chronic schizophrenia (Stress, adrenaline-test, ACTH-test)." *Acta Endocrinol. (Kbh.)* **8**: 215-246 (1951).

B63,996/51

In man, EP treatment and the production of fever by injections of killed *B. faecalis alcaligenes* are regarded as adequate "stress tests" as indicated by the increase in uric acid and potassium excretion as well as by the hematologic changes that result.

Fisher, B., Fisher, E. R.: "Observations on the eosinophil count in man. A proposed test of adrenal cortical function." *Am. J. Med. Sci.* **221**: 121-132 (1951).

B63,230/51

Dougherty, T. F., Kumagai, L. F.: "Influence of stress stimuli on lymphatic tissue of adrenalectomized mice." *Endocrinology* **48**: 691-699 (1951).

B60,246/51

Mice stressed two hours after adrenalectomy developed a significant lymphocytosis lasting several hours, which is the reverse of the response seen in intact animals. After adrenalectomy, the lymphatic organs of mice in sublethal anaphylaxis were actually enlarged. The stress lymphocytosis was not prevented by splenectomy, and hence could not be ascribed to an evacuation of the splenic reservoir. The findings "are compatible with the concept that the stimulus of stress not only augments pituitary adrenocortical secretion which inhibits lymphatic tissue growth, but also augments, directly or indirectly, lymphatic tissue growth promoting influences unrelated to adrenocortical secretion."

Dougherty, T. F.: "Effect of hormones on lymphatic tissue." *Physiol. Rev.* **32**: 379-401 (1952). B75,769/52

Extensive review on the effect of stress, and of hormones produced during stress, upon thymicolympathic tissue and blood count, including the development of "stress lymphocytes."

Dougherty, T. F., Frank, J. A.: "Relative adrenocortical insufficiency determined by morphological alterations in lymphocytes." *Am. J. Physiol.* **171**: 721 (1952).

B77,237/52

Stressors produce lymphopenia in intact mice, whereas they cause lymphocytosis after adrenalectomy owing to the excessive development of hyaline lymphocytes. The latter can be prevented by cortisol.

Dreyfuss, F., Feldman, S.: "Eosinopenia induced by emotional stress." *Acta Med. Scand.* **144**: 107-113 (1952). B82,162/52

Eosinopenia occurred in medical students just before examinations, and sometimes persisted even later. The same phenomenon was noted in women during the anxiousness prior to diagnostic curettage, and this was "ascribed to the considerable emotional stress undergone in the two situations."

Bacchus, H., Altszuler, N.: "Eosinophil response to stress in ascorbic acid pretreated mice." *Endocrinology* **51**: 1-4 (1952).

B74,531/52

In mice, ascorbic acid pretreatment prevents the eosinopenia caused by EP but not that elicited by ACTH. "These observations were interpreted as indicating that the vitamin operated in this mechanism by depressing the release of pituitary corticotrophic hormone."

Kuhl, W. J. Jr., Wilson, H., Ralli, E. P.: "Measurements of adrenal cortical activity in young men subjected to acute stress." *J. Clin. Endocrinol. Metab.* **12**: 393-406 (1952). B69,085/52

Normal men immersed in cold water for eight minutes exhibited significant eosinopenia, lymphopenia and hypochloremia, with increased ascorbic acid and uric acid excretion. Serum sodium, potassium, blood sugar and ascorbic acid were not significantly altered.

Patients under intense psychogenic stress may develop polycythemia.

Wake, R. F., Graham, B. F., McGrath, S. D.: "A study of the eosinophil response to exercise in man." *J. Aviat. Med.* **24** Supp., Sect. 2: 127-130 (1953). J23,815/53

In healthy young men, physical exercise—like other stressors—causes eosinopenia.

Frank, J. A., Dougherty, T. F.: "Evaluation of susceptibility to stress stimuli determined by stress lymphocytes" (abstracted). *Fed. Proc.* **12**: 45 (1953). B78,552/53

Louch, C., Meyer, R. K., Emlen, J. T.: "Effect of stress on diurnal fluctuations in eosinophils of the laboratory mouse." *Proc. Soc. Exp. Biol. Med.* **82**: 668-671 (1953).

B82,222/53

In mice, there are pronounced circadian variations in eosinophil counts, showing peaks during the day and drops during the night, presumably owing to the characteristic nocturnal activity of this species. Exposure to cold decreased the eosinophil count but did not eliminate the circadian fluctuations. Presumably, nocturnal activity in these experiments acted as a secondary stress superimposed upon the sustained stress of exposure to cold. "The adrenal gland of the mouse exposed to cold is capable of responding further to the daily stress of nocturnal activity."

Thorn, G. W., Jenkins, D., Laidlaw, J. C.: "The adrenal response to stress in man." *Rec. Prog. Horm. Res.* **8**: 171-215 (1953).

B73,567/53

Extensive review lecture on clinical indices of adrenal responses to stress in man, and the role of the G.A.S. in the pathogenesis of diseases of adaptation. Special emphasis is placed upon reactivity to infusions of ACTH, corticoids and EP, as well as upon the diagnostic value of blood eosinophils and 17-KS excretion, as indicators of adrenocortical participation in stress responses (47 refs.).

Persky, H.: "Response to a life stress: evaluation of some biochemical indices." *J. Appl. Physiol.* **6**: 369-374 (1953).

J11,917/53

Pilots under training were subjected to various stressors (parachute jumps, physical exercise and so on) which caused a significant diminution in blood eosinophil and glutathione levels but did not affect the synthesis of hippuric acid from administered sodium benzoate. "These findings are taken to indicate that airborne training focal stresses are of intermediate severity on a scale whose poles are fear of failure and fear of bodily injury."

Thorn, G. W.: "The eosinophil, ACTH, epinephrin and stress." *Am. J. Med.* **14**: 139-140 (1953).

B88,002/53

Brief résumé on the value of eosinopenia in the assessment of stress and ACTH or glucocorticoid discharge in man under various conditions.

Dougherty, T. F., Frank, J. A.: "The quantitative and qualitative responses of blood lymphocytes to stress stimuli." *J. Lab. Clin. Med.* **42**: 530-537 (1953).

B92,713/53

In addition to the normal lymphocytes, the mouse has "stress lymphocytes" with a large, poorly basophilic cytoplasm. The lymphopenia induced by stress in intact mice is due to a decrease in the number of normal lymphocytes, whereas the stress lymphocyte count remains unchanged or even rises. Apparently, they are resistant to the lytic effect of glucocorticoids. "The production of stress lymphocytes is due to nonadrenocortically mediated effects of stressors which bring factors into play which increase the number of lymphocytes and induce specific cytologic changes."

Porter, R. W.: "I. Nervous system—Hormone interrelationships. The central nervous system and stress-induced eosinopenia." *Rec. Prog. Horm. Res.* **10**: 1-18 (1954).

B98,592/54

In rhesus monkeys the nervous regulation

of the pituitary-adrenocortical response to stress was demonstrated by the following observations: 1) Increased electrical activity was noted in the posterior hypothalamus on application of certain acute stress stimuli. 2) The integrity of the hypothalamus was essential for the production of stress-induced eosinopenia. 3) Electrical excitation of this region evoked a marked eosinopenia. It was concluded that although many regions of the brain can modify the eosinopenic response to an acute stress stimulus, the hypothalamus alone is essential for its manifestation."

Cowie, A. T., Ganong, W. F., Hume, D. M.: "The eosinopenic response to graded doses of hydrocortisone in the adrenalectomized dog with and without surgical trauma." *Endocrinology* **55**: 745-750 (1954).

C264/54

The eosinopenic effect of low doses of cortisol is increased by surgical trauma, even in adrenalectomized dogs. "These and other data throw doubt on the hypothesis that increased corticoid utilization is responsible for the pituitary release of ACTH in response to operative trauma."

Lundin, P. M., Schelin, U., Pellegrini, G., Mellgren, J.: "Plasma cell production in the adaptation syndrome." *Acta Pathol. Microbiol. Scand.* **35**: 339-356 (1954).

C9,986/54

In rats, various types of stressors eliciting a typical G.A.S. cause plasma cell proliferation, which has been ascribed to increased production of STH.

"'Stress' polycythemia is a term that refers to a disorder manifested by a normal red blood cell mass, but a high hematocrit reading secondary to a contracted plasma volume. The latter has been ascribed to a wide variety of stressful factors including emotional stress, chronic anxiety, alcoholism, and a variation of the normal state. Hypertension (perhaps too long associated with 'stress') has been closely associated with 'stress' polycythemia" (30 refs.).

Ahmed, A., Herman, C. M., Knudsen, R. C., Sode, J., Strong, D. M., Sell, K. W.: "Effect of exogenous and endogenous glucocorticosteroids on the in vitro stimulation of lymphocytes from sedated and awake-restrained healthy baboons." *J. Surg. Res.* **16**: 172-182 (1974). J12,487/74

In baboons, the stress of squeeze-cage manipulation and restraint decreases the relative and total blood lymphocyte counts. There is an associated suppression of methyl-³H-thymidine incorporation by unstimulated, as well as by T-cell mitogen- and B-cell mitogen-stimulated lymphocytes. Subsequent injection of methylprednisolone further inhibits this incorporation; however, exogenous corticoids affect the thymus-derived T-cells more than the bursa of Fabricius equivalent B-cells. The T-cells seem to be directly concerned with cell-mediated immunity and the B-cells with the production of humoral antibodies. Hence, the immunosuppressive effect of stress and glucocorticoids is probably one of the characteristic consequences of the thymicolymphatic involution and lymphopenia that have been recognized as a typical

stress effect since the first formulation of the G.A.S. concept.

Cardiovascular System

The intense effects that stress may exert upon the cardiovascular system are among the earliest manifestations of the emergency reaction in preparation for fight or flight, various forms of surgical and toxic shock and so on. Flushing of the face or pallor, and in predisposed individuals after chronic exposure, a great variety of cardiovascular diseases, are likewise indubitably related to the actions of stressors. These latter phenomena will be discussed at length in the section on Diseases of Adaptation.

Among the less frequently discussed cardiovascular manifestations of stress, let us merely mention that cardiac glycogen tends to be depleted and focal necroses may occur in rats exposed to acute stress situations. The associated functional changes (variations in the ECG, blood pressure and so on) will be dealt with later in the section on Functional Changes.

Hauss, W. H.: "Tissue alterations due to experimental arteriosclerosis." In: Vogel, H. G., *Connective Tissue and Ageing* (Int. Congr. Ser. No. 264), pp. 23-33. Amsterdam: Excerpta Medica, 1973. J14,882/73

In rats, the emotional stress produced by restraint elicits typical mesenchymal reactions in the blood vessel walls with increased ³⁵S-sulfate and ³H-thymidine incorporation. Essentially similar changes occur after exposure to other stressors, and these are considered to be the first step in the arteriosclerotic process characteristic of aging. "The deformation of the structure of the arterial wall participates essentially in the development of lipidosis, fibrinosis, and cell necroses. Aggregation of thrombocytes and thrombosis in the arterial wall results from the frequent reduplication of intima cells."

Gastrointestinal System

Acute hemorrhagic erosions of the gastric and intestinal mucosa are among the most characteristic manifestations of the typical "stress triad." They have been described and illustrated in the first publications on the alarm reaction, and will be discussed in greater detail in the section on Experimental Diseases of Adaptation conjointly with the various prophylactic and therapeutic measures developed to deal with them.

These ulcers are usually superficial and tend to heal rapidly following discontinuation of treatment with the stressor. They may be localized in the stomach, duodenum or upper small intestine, depending upon circumstances, particularly the species of experimental animal examined. In the rat, they are limited to the glandular stomach (ventriculus) and rarely if ever occur in the proventriculus.

The pathogenesis of these ulcers is still not very well understood; however, digestive juices undoubtedly play a decisive role in their formation, which depends partly upon glucocorticoids and partly upon autonomic nervous stimuli. In man, ACTH and cortisol increase basal nocturnal gastric hydrochloric acid and pepsin secretion, with a concomitant rise in uropepsin excretion. Similar changes are seen during stress which notoriously increases gastric secretion. Under normal conditions, the stomach requires adrenocortical function for acid-peptic activity, but during stress it is more directly under adrenocortical control, and the two factors play a conditioning, mutually synergistic role in both gastric secretion and in the development of stress ulcers.

Vagotomized rats are largely protected against stress ulcers, whereas hypophysectomy or adrenalectomy has no prophylactic effect. Curiously, both a deficiency and an excess of glucocorticoids enhance gastric ulcer formation during stress.

However, it is very difficult to draw any precise line of demarcation between more or less physiologic and distinctly pathologic responses of the gastrointestinal system to stressors; hence, much pertinent information will be found in the section Experimental Diseases of Adaptation.

In the following abstracts the reader will also find a few additional data concerning functional changes in the gastrointestinal system during stress, for example, in connection with motility and absorbing power. Most of these are associated with morphologic changes, and we did not create a special section dealing with the gastrointestinal tract under Functional Changes.

Gastrointestinal System

(See also our earlier stress monographs, p. xiii)

Selye, H.: "Studies on adaptation." *Endocrinology* **21**: 169-188 (1937). 38,798/37

First detailed description of the three stages of the G.A.S. and the concept of "adaptation energy," with an extensive and illustrative characterization of the morphologic lesions produced by stress (especially in the hypophysis, adrenals, thymicolumphatic apparatus, pancreas and gastrointestinal tract, and its effects upon inflammation (anaphylactoid edema).

Comparative studies of the morphologic changes in the liver, thymicolumphatic apparatus (including the spleen) and duodenum of the mouse and rat after an alarm reaction is produced by ethyl ether, colchicine, urethane, or hydroquinone. Special attention is given to derangements in mitoses, particularly nuclear pyknosis (191 refs.).

Gray, S. J., Ramsey, C., Reifenstein, R. W., Benson, J. A. Jr.: "The significance of hormonal factors in the pathogenesis of peptic ulcer." *Gastroenterology* **25**: 156-172 (1953). B89,103/53

In man, ACTH and cortisone enhance the basal nocturnal gastric hydrochloric acid and pepsin secretion with a concomitant increase in uropepsin excretion. Similar changes are seen during stress, but vagotomy and anticholinergic agents "do not appear to alter the gastric acid, pepsin and urinary uropepsin response to adrenal stimulation or stress. . . . Although the gastric response to stress is undoubtedly mediated through the vagus nerve, there appears to be an additional hormonal

mechanism which is intimately associated with the adrenal gland and the general adaptation syndrome."

Studies on the effect of electroshock upon the jejunal mucosa. "Stress was found to inhibit crypt cell proliferation in intact rats and in both adrenalectomised rats and in rats subjected to beta adrenergic blockage. However, sympathectomy appeared to prevent the inhibition of crypt cell proliferation by stress."

Oral (Teeth, Periodontal) Structures

Numerous investigators have examined the effect of stress upon various oral structures. It has been claimed that minor histologic changes can be observed in the teeth, alveolar bones and periodontal tissues of various rodents exposed to chronic stress, and indeed that even psychogenic stressors can increase the incidence of dental caries in rats. The frequency of fluctuating dental asymmetry and ulcer formation in the oral mucosa is allegedly also increased. However, it would still be difficult to delineate, with any degree of precision, those changes in the oral structures that are truly nonspecific and due to systemic stress.

Of course, the effects of topical stress such as mechanical trauma (grinding of the teeth, dental surgery), and of chemical or bacterial injury, are well established and represent an integral part of everyday dentistry.

In rats, restraint causes ulceration of both oral and gastric mucosa.

Manhold, J. H. Jr.: "Relationship of social stress and oral disease." *Psychosomatics* 11: 41-44 (1970). H23,479/70

Review of the literature and personal observations on rats suggesting that crowding interferes with the oxygen utilization of gingival tissue and hence may cause periodontal disease (21 refs.).

Whittaker, D. K., Wilson, T. R.: "The effect of age and strain differences on the incidence of restraint-induced oral and gastric ulcers in three strains of rats." *J. Dent. Res.* 51: 619-625 (1972). J19,863/72

In different strains of rats, the stress of restraint may cause predominantly gastric or oral ulcers. The clinical literature suggesting that ulcerative gingivitis, chronic periodontitis and herpes labialis may also be related to stress in man is reviewed.

Siegel, M. I., Smookler, H. H.: "Fluctuating dental asymmetry and audiogenic stress." *Growth* 37: 35-39 (1973). J8,473/73

Dental asymmetry had previously been ascribed to environmental stress. In this study, pregnant rats were exposed to intermittent audiogenic stress. "The degree of fluctuating asymmetry of mandibular molar width and length was determined for stressed litters and shown to be significantly greater than for controls reared under normal laboratory conditions."

Salivary Glands

Several earlier investigators claimed that the salivary glands participate in the alarm reaction, somewhat as does the pancreas, by the loss of secretion granules and occasional focal necroses. At the same time, there is a decrease in the RNA content and in the granularity of the acini, especially in the submaxillary glands. Such changes occur only under the influence of severe stressors, but a reduction in salivary secretion is evident even during minor psychogenic stress such as examinations.

Allegedly, the pre-parotid Loewenthal gland shows signs of increased activity in rats exposed to stressful acoustic stimulation.

Although several investigators have studied these problems, objective quantitative data are scarce. It is a matter of everyday experience that salivary flow diminishes and

that the oral mucosa becomes dry during various stressful situations of daily life, including public speaking or academic examinations, if these are experienced as demanding and distressful.

Salivary Glands

(See also our earlier stress monographs, p. xiii)

Ehrich, W. E., Seifter, J.: "Role played by the salivary glands in the 'alarm reaction.'" *Arch. Pathol.* **45**: 239-245 (1948).

B31,789/48

"An alarm reaction was produced experimentally in rats, dogs and rabbits with large doses of colchicine, aminopyrine, selenium compounds and other drugs. It was found that the salivary glands participate in this reaction. As in the pancreas, there was marked loss of zymogen granules, and in severe cases there was also focal necrosis."

Frawley, T. F., Thorn, G. W.: "The relation of the salivary sodium-potassium ratio to adrenal cortical activity." In: Mote, J. R., *Proceedings of the Second Clinical ACTH Conference. I. Research*, pp. 115-122. New York, Philadelphia and Toronto: Blakiston, 1951.

B58,733/51

In man, the salivary sodium:potassium ratio is normally about 1:3 but rises to 5:0 in Addison's disease and falls to 0:5 in Cushing's syndrome. DOC treatment produces a 25 percent drop in the ratio. Patients responding adequately to ACTH exhibit decreases of 18 to 68 percent. "The salivary Na/K ratio affords a simple means of following changes in adrenal cortical activity in terms of electrolyte regulation."

Rosenman, H., Charipper, H. A., Stahl, S. S.: "The effects of stress on the submaxillary glands of young adult male rats. Selected histochemical observations." *Arch. Oral Biol.* **2**: 196-202 (1960).

J23,137/60

In rats, "during the alarm reaction, the submaxillary glands showed a decrease in RNA, a decrease in the granularity of the acini, a decrease in interacinar connective tissue and an increase in granularity of the duct cells. The ducts stained more PAS-positive than the acini. A highly insoluble, heat-resistant, diastase-fast, PAS-positive material was present in the duct cells. During the stage of resistance, the duct cells showed a decrease in granules with little acinar change.

No observable difference in alkaline phosphatase activity was noted."

Bogdonoff, M. D., Bogdonoff, M. M., Wolf, S. G. Jr.: "Studies on salivary function in man: variations in secretory rate as part of the individual's adaptive pattern." *J. Psychosom. Res.* **5**: 170-174 (1961).

J23,512/61

J20,495/71

dren." *Rev. Roum. Physiol.* **8**: 307-312 (1971). J20,219/71

In children, surgical trauma decreases secretion of saliva and induces an "elevation of the concentration and output of salivary amylase, seemingly by the interference of glucocorticoid hormones."

Igarashi, T.: "Influence of sialoadenectomy and cyanide on the stress loop." *Shikwa Gakuho* **71**: 1356-1370 (1971) (Japanese). J24,561/71

Hafner, R. J.: "Physiological changes with stress in depression and obsessional neurosis." *J. Psychosom. Res.* **18**: 175-179 (1974). J15,135/74

Comparative studies on the salivary flow and potassium:sodium ratio in the saliva of depressed and obsessional subjects.

Hafner, R. J.: "Relationships between personality and autonomic nervous reactions to stress." *J. Psychosom. Res.* **18**: 181-185 (1974). J15,136/74

Salivary secretion and particularly the sodium:potassium ratio correlates well with psychogenic stress in man. In subjects who react defensively, the response is essentially different from that of subjects who react with aggressive attributes (16 refs.).

Lung

Comparatively few reliable observations are available concerning the participation of the lung in stress reactions. There is some evidence that the pulmonary circulation is affected and that stress predisposes to pulmonary edema, disseminated hemorrhages and to the "white lung syndrome."

However, most of the relevant observations have been made on alveolar macrophages, which may undergo degenerative changes during acute stress. It has also been claimed that the mitochondria of the lung may undergo "lamellar" transformation under the influence of stressors but the functional significance of this change is not clear.

Lung

(See also our earlier stress monographs, p. xiii)

Szidon, J. P., Fishman, A. P.: "Participation of pulmonary circulation in the defense reaction." *Am. J. Physiol.* **220**: 364-370 (1971). J20,735/71

Observations on dogs suggest that "engagement of the pulmonary vasomotor nerves in the defense reaction may be relevant to the pattern of adjustment of the pulmonary circulation during exercise and other forms of stress."

Brown, H. S., Turk, L. N., Hopkins,

W. A.: "Management of the white lung syndrome." *Ann. Thorac. Surg.* **13**: 411-419 (1972). J20,020/72

"Similar clinical pulmonary characteristics may develop after severe body stress and can be placed into one category for purposes of definition and treatment. Seventeen patients satisfying the criteria of so-called white lung syndrome were treated in private hospitals in metropolitan Atlanta during a three-year period."

Ocular Structures

Even in my earliest experiments on the stress reaction, I noticed that the cornea tends to become cloudy under severe stress in the rat and cat, an observation consequently confirmed in several other species. In the Japanese literature, this is referred to as "Komi's nonspecific corneal reaction." Furthermore, various stressors can produce herpetic keratitis in rabbits and sometimes, allegedly, even chorioretinitis, all of which were considered nonspecific responses associated with the G.A.S.

In young people of both sexes, the stress of muscular exercise on a bicycle ergometer may increase intraocular pressure. The associated biochemical changes in the eye, particularly altered enzyme activities, have also been the subjects of intensive studies, but their participation in spontaneous ophthalmologic diseases of man remains to be clarified.

Ocular Structures

(See also our earlier stress monographs, p. xiii)

Ikeda, I.: "The stress and changes of the cornea." *Folia Ophthalmol. Jap.* **12**: 639-650 (1961). E84,262/61

Stress causes corneal opacity (Komi's non-specific corneal reaction) in the rabbit. Fur-

thermore, "various stressors, such as electro-shock, moist heat, gravity shock, enucleatio bulbi without anesthesia, are found to favour the incidence of experimental herpetic keratitis in rabbits, to shorten its latent period, to make worse its clinical course and to delay its natural healing."

Kreislaufparameter" (Intraocular pressure under physical stress. A methodical investigation under reproducible conditions. I. Circulatory parameters). *Albrecht von Graefes Arch. Klin. Ophthalmol.* **186**: 91-104 (1973). *H92,275/73*
- In young people of both sexes, the stress of muscular exercise on a bicycle ergometer caused a decrease in intraocular pressure. This correlated well with pulse frequency and blood pressure.
- Kypke, W., Höllge, J., Scriba, B.: "Augeninnendruck während und nach körperlicher Belastung. Eine systematische Untersuchung unter reproduzierbaren Arbeitsbedingungen. II. Säuren-Basenhaushalt" (Intraocular pressure under physical stress. A methodical investigation under reproducible conditions. II. Acid-base parameter). *Albrecht von Graefes Arch. Klin. Ophthalmol.* **188**: 43-53 (1973). *J19,560/73*
- In man, a highly significant correlation was found between intraocular pressure and metabolic acidosis during and after stressful exercise on a bicycle ergometer.

Kidney

The effect of stress upon diuresis and the excretion of various metabolites has been dealt with in the section on Chemical Changes, whereas diseases of the kidney in which stress plays a decisive role will be considered under Diseases of Adaptation. Here, we shall only consider a few reports on morphologic changes in the kidney that are not, strictly speaking, disease manifestations.

It has been claimed that such stressors as formaldehyde, cold or forced muscular exercise elicit an immediate enlargement of the kidney, with mitotic proliferation in the proximal convoluted tubules of the rat. Allegedly, these alterations can be prevented by adrenalectomy, and should be considered characteristic of the alarm reaction.

In tree shrews, repeated fighting, or merely continuous fear induced in the loser by the sight of a previously victorious male, causes a gradual loss of renal weight, allegedly suggesting "the great significance which social stress may have in the origin of renal disease—possibly in man as well as in animals."

In healthy young boys, the considerable physical effort of a swimming race led to the appearance of abundant urinary casts and proteinuria.

An overview of the pertinent literature indicates that acute stress may cause some renal enlargement and tubular proliferation, but chronic stress with the associated catabolism undoubtedly diminishes the size of the kidney at least as much as that of other organs. In addition, certain humoral changes, such as increased secretion of mineralocorticoids and renal pressor factors may adversely influence the kidney during stress, especially in combination with high sodium and protein diets. Furthermore, the very severe stress associated with surgical, hemorrhagic or toxic shock can cause acute and severe vascular derangements in the kidney, leading to necrosis.

Arai, S., Suzuki, T., Nokubi, K., et al.: "Histochemical changes in the kidneys and suprarenal glands of rats subjected to stress." *J. Tokyo Med. Coll.* **26**: 239-244 (1968). J24,400/68

Pashchenko, V. P.: "Effect of extremal factors on growth of kidney tissue in culture." *Biull. Èksp. Biol. Med.* **70** No. 8: 94-98 (1970) (Russian). Engl. trans.: *Bull. Èksp. Biol. Med.* **70**: 940-943 (1970). J21,610/70

On the basis of experiments in mice, "it is postulated that changes in growth of kidney tissue after exposure of the animals to extremal factors are a manifestation of the general adaptation syndrome."

Hoshizaki, T., McNew, J. J., Sabbot, I., Adey, W. R.: "Micturition patterns of an unrestrained chimpanzee under entrained and free running conditions." *Aerosp. Med.* **43**: 149-154 (1972). J20,222/72

In a male chimpanzee, stress altered the normal circadian pattern of micturition and

urine volume, especially during the stage of resistance of the G.A.S. (22 refs.).

Holst, D. von: "Renal failure as the cause of death in *Tupaia belangeri* exposed to persistent social stress." *J. Comp. Physiol.* **78**: 236-273 (1972). G93,301/72

When two adult male *Tupaias* are introduced, they immediately begin to fight. Subsequently, merely seeing the victor induces stress manifestations in the defeated *Tupaia*. This is associated with a constant decline in body weight, liver glycogen, blood hemoglobin and kidney weight, eventually resulting in fatal uremia. "The evidence from natural populations, when examined along with the findings from tree-shrews, show the great significance which social stress may have in the origin of renal disease—possibly in man as well as in animals."

Mullane, J. F., Wilfong, R. G., Phelps, T. O., Fischer, R. P.: "Metabolic acidosis, stress and gastric lesions in the rat." *Arch. Surg.* **107**: 456-459 (1973). J5,966/73

In rats, the acidosis induced by restraint and ingestion of ammonium chloride was compared with that in patients with renal failure. "These studies suggest that metabolic acidosis may account in part for gastric lesions associated with renal failure."

Fernández, A. E., Miatello, V. R., Zanetti, N. L., Olego, O., Carballo, J.: "Manifestaciones renales consecutivas al esfuerzo físico" (Renal effects of physical effort). *Prensa Méd. Argent.* **60**: 1006-1008 (1973). H81,565/73

Among perfectly healthy boys thirteen to fifteen years of age in whom careful examination showed no renal anomalies, the considerable physical effort of a swimming race led to the appearance of abundant urinary casts and proteinuria. "These urinary patterns are similar to those found in severe glomerulopathies."

Knochel, J. P., Dotin, L. N., Hamburger, R. J.: "Heat stress, exercise and muscle injury: effects on urate metabolism and renal function." *Ann. Intern. Med.* **81**: 321-328 (1974). J16,296/74

Description of the "heat stress nephropathy" which develops during intense physical training in hot climates.

Fröberg, J., Karlsson, C.-G., Lennquist, S., Levi, L., Mathé, A. A., Theorell, T.: "Renal and adrenal function: a comparison between responses to cold and to psychosocial stres-

sors in human subjects. A pilot study." *Lab. Clin. Stress Res.* (Stockh.) Rep. No. 40: 1-27 (1974). J18,098/74

In man, "psychosocial stressors can elicit a renal response which is fully analogous to the response to cold, including increased diuresis accompanied by significant increases in osmolal clearance and excretion of sodium,

chloride, calcium, phosphate and uric acid along with a significant decrease in the tubular reabsorption of sodium and calcium. This seems to indicate that cold-induced diuresis is not a response specific to cold, since the same response can also be elicited by other forms of stimuli, e.g., psychosocial ones."

Liver

The literature on the effect of various stressors upon the liver is so voluminous that the reader will have to depend almost entirely upon the data cited in the abstract section, since only a few of the best-established highlights can be briefly mentioned here.

The weight of the liver—like that of most organs other than the adrenals—is diminished during severe stress as part of the general catabolic response. The commonly mentioned nonspecific changes detectable by the light microscope are: congestion (especially of the sinusoids), centrilobular necrosis and sometimes single-cell necrosis throughout the acini, fatty degeneration, loss of glycogen, the appearance of "plant-like cells," "ballooning" of hepatocytes, and PAS-positive hyaline droplets of the Councilman type, as well as "toxic hepatitis," which presumably is often related to the development of postoperative icterus and perhaps intrahepatic cholestasis.

In addition, some authors have noted an increase in the alkaline phosphatase content of perithelial cells; however, this is histochemically demonstrable only using certain substrates.

Stress-induced lipidosis may be detectable as early as ten minutes after sham operations, both in the cytoplasm of hepatocytes and in Disse's spaces (which are also often distended by edema). Only the hepatocytes contain the lipid bodies, whereas the Kupffer cells and Ito's fat-storing cells do not; this "may indicate a very specific lipid mobilization response on the part of the cells of the hepatic parenchyma."

EM observations suggest mitochondrial fragmentation with swelling of the cristae, as well as an increase in intramitochondrial dense bodies and autophagic vacuoles. The liver obviously plays a central role in the metabolic changes characteristic of stress, and its light microscopic and ultrastructural response has been described after exposure to a great variety of stressors (hypoxia, hemorrhage, temperature variations, particularly heat stroke, acceleration and deceleration, malnutrition and so on); yet virtually no systematic attempt has been made to strictly characterize which of the changes are truly nonspecific, and what the conditioning factors are for the predominance of one or the other type of response.

Liver

(See also our earlier stress monographs, p. xiii)

MacMahon, H. E.: "Electric shock." *Am. J. Pathol.* 5: 333-347 (1929). 27,847/29

In cats, dogs and guinea pigs, repeated sublethal electric shocks produce only congestion in the periphery of the hepatic lobules.

Leblond, C. P., Nguyen-van Thoai, Segal, G.: "Infiltration graisseuse du foie sous l'action des agents nocifs" (Lipid infiltration of the liver under the influence of noxious agents). *C.R. Soc. Biol. (Paris)* 130: 1557-1559 (1939). A18,194/39

nach Verbrennung. Ein Beitrag zur Frage des Verbrennungskollapses" (Hepatic-renal lesions and insufficiency after burn. The problem of burn shock). *Klin. Wochenschr.* **19**: 78-84 (1940). B33,768/40

In patients with extensive skin burns, centrilobular necroses often accompany the characteristic renal changes.

Müller, E., Rotter, W.: "Ueber histologische Veränderungen beim akuten Höhentod" (Histologic changes in death due to anoxia). *Beitr. Pathol. Anat.* **107**: 156-172 (1942). C45,858/42

In pilots who died as a consequence of acute hypoxia, only minor hepatic changes were noted, such as slight hepatocyte vacuolization and occasional single cell necrosis.

Cleghorn, R. A.: "Studies of shock produced by muscle trauma. II. Pathological changes in various tissues." *Can. J. Res. [E]* **24**: 155-162 (1946). B2,573/46

In dogs, muscle trauma conducive to severe shock produces various organ changes, including congestion of the liver with centrilobular hepatocyte degeneration.

Gillman, J., Gillman, T.: "Anoxia and the liver with special reference to shock and chronic malnutrition." *S. Afr. J. Med. Sci.* **13**: 11-43 (1948). B43,992/48

Microscopic examination of the livers of 275 patients who died rapidly from asphyxia, hemorrhage, carbon monoxide or prussic acid poisoning frequently showed fat- and glycogen-free vacuoles in their hepatocytes. A sharp distinction is made between cells having discrete multiple vacuoles (vacuolated cells) and those containing few, but large, rectangular- or trapezoidal-shaped vacuoles (plant-like cells). Both types tend to occur in clusters. Plant-like cells are also found in the livers of pellagrins and of protein-deficient rats or dogs. They often terminate in necrosis (65 refs., 22 microphotographs).

Moon, V. H.: "The pathology of secondary shock." *Am. J. Pathol.* **24**: 235-273 (1948).

B19,951/48

Review on the pathology of secondary shock, especially in man. "Hepatic degeneration and necrosis were regular features, but their degree and distribution were inconstant. Degeneration tended to be diffuse and the degree varied from granular cytoplasm and vesicular nuclei to necrosis. Absence of nuclei, pyknosis, and disintegrating cells were the criteria for necrosis. Frequently this involved only scattered groups of cells; when

the groups were larger, focal necrosis was seen. Occasionally, as after burns, heat stroke, or death from low atmospheric pressure, extensive necrosis involved the centers of the lobules and resembled that produced by poisons" (57 refs.).

Altmann, H. W.: "Über Leberveränderungen bei allgemeinem Sauerstoffmangel nach Unterdruckexperimenten an Katzen" (Hepatic changes induced by general hypoxia and decompression experiments in cats). *Frankfurt. Z. Pathol.* **60**: 376-494 (1949).

A49,602/49

Extensive review on structural changes in the liver following exposure to decreased oxygen pressure, especially in cats. The most characteristic lesions are vacuoles and hyaline droplets, with occasional single-cell necroses in the hepatocytes and serous inflammation during the acute stage. After chronic hypoxia, centrilobular necrosis becomes very widespread and may lead to cirrhosis, or it may heal without leaving any scars (numerous refs.).

Leduc, J., Guillemin, R.: "Le syndrome général de l'adaptation. Etude comparée de l'involution des différents organes au cours de la réaction d'alarme" (The general adaptation syndrome. A comparative study of the involution of various organs during the alarm reaction). *Arch. Int. Physiol.* **56**: 207-218 (1949).

B27,410/49

In rats exposed to different stressors (cold, fasting), various organs, particularly the liver, thymus and spleen, undergo considerable involution.

Gore, I., Isaacson, N. H.: "The pathology of hyperpyrexia. Observations at autopsy in 17 cases of fever therapy." *Am. J. Pathol.* **25**: 1029-1059 (1949).

B41,903/49

In seventeen cases of fatal therapeutic hyperpyrexia, jaundice with hemorrhages and necroses in various organs, particularly the liver, were characteristic. A review of the literature suggests that fever due to causes other than therapeutic pyrogens can elicit similar organ lesions (83 refs.).

Desmarais, A.: "Contribution à l'étude du choc" (Contribution to the study of shock). *Laval Méd.* **14**: 346-379; 443-476 (1949).

B49,433/49

Review on the effect of stress upon various organs, particularly the liver, with special reference to the G.A.S. (149 refs.).

Skelton, F. R.: "Some specific and non-specific effects of thiamine deficiency in the

rat." *Proc. Soc. Exp. Biol. Med.* **73**: 516-519 (1950). B41,300/50

In rats, thiamine deficiency, as well as partial starvation, produces a typical stress response with adrenocortical hypertrophy, thymus involution and organ manifestations of the alarm reaction. Simultaneously, various parenchymal organs, including the liver, undergo considerable involution.

Herlant, M., Timiras, P. S.: "Alkaline phosphatases in various tissues of the rat during the alarm-reaction." *Endocrinology* **46**: 243-252 (1950). B41,763/50

In rats, exposure to various stressors, such as formalin, cold or severe hypoxia, causes an increase in alkaline phosphatase (using glycerophosphate and fructose diphosphate as substrates) in the liver, lung, spleen, lymph nodes and thymus. No such increase was observed in these organs with yeast nucleic acid substrate. In the liver, the enzyme is located principally in the perithelial cells of the vessels and the bile ducts. Some reaction also occurs in the nuclei and particularly in the nucleoli of the hepatocytes, but not in the cytoplasm. Preliminary studies revealed no significant change in the acid phosphatase content of the organs that could be ascribed to stress.

Ellenberg, M., Osserman, K. E.: "The role of shock in the production of central liver cell necrosis." *Am. J. Med.* **11**: 170-178 (1951). B64,361/51

In patients, "central liver cell necrosis, as defined by (1) congestion, (2) eosinophilic staining, (3) nuclear changes, (4) cellular infiltration and (5) architectural disruption, all centrilobular in location, is definitely related to shock" (29 refs.).

Klein, H.: "Zur pathologischen Anatomie der Alarmreaktion nach Kerngiften" (The pathology of the alarm reaction after nuclear toxins). *Virchows Arch. [Pathol. Anat.]* **320**: 93-137 (1951). B69,206/51

Comparative studies of morphologic changes in the liver, thymicolumphatic apparatus (including the spleen), and duodenum of the mouse and rat after an alarm reaction is produced by ethyl ether, colchicine, urethane or hydroquinone. Special attention is given to derangements in mitoses, particularly nuclear pyknosis (191 refs.).

Xavier, A. A., Corrêa, J. C.: "Alterações patológicas consequentes a estados emocionais experimentais (comunicação preliminar)" (Pathologic changes following experimental

emotional states. [Preliminary communication]). *Brasil-Méd.* **65**: 373-374 (1951) (Portuguese). B94,758/51

In rabbits, strong emotional excitement (anxiety, terror, rage, pain, hunger, sleeplessness) produces structural alterations in various organs, including "degenerative changes in the liver" with "deposition of mineral substances" [Report in anecdotal style; no quantitative data (H.S.).]

Moysen, F.: *Etude des Modifications Morphologiques et Fonctionnelles du Foie dans les Etats Posttraumatiques* (A study of the morphologic and functional changes of the liver in post traumatic states), p. 62. Bruxelles: Les Editions Acta Medica Belgica, 1952. B68,706/52

Monograph on the changes in the liver during "posttraumatic states," particularly in relation to the G.A.S. (numerous refs.).

Milin, R., Janjatović, M.: "A contribution to the study of syndromes in the so-called 'southern wind disease' (zajuživanje) in sheep." *Veterinaria* (Sarajevo) **5**: 401-431 (1952) (Serbo-Croatian). B72,751/52

In sheep suffering from "southern-wind-disease" due to sudden migration of a herd from high mountains to the lowlands, the ensuing moderate hepatic lesions are ascribed to stress.

Stenram, U.: "Basophilic rods in the liver cell cytoplasm of rat." *Acta Anat.* (Basel) **18**: 360-377 (1953). A68,449/53

In rat hepatocytes, basophilic, palisade-like arranged rods appear following thyroid administration. They show no sex, age or diurnal variations, and develop also after acute bleeding, starvation, EP or NEP treatment. These rods contain RNA and presumably indicate increased cellular activity.

Wilson, M. E., Stowell, R. E.: "Cytological changes following roentgen irradiation of the liver in mice." *J. Natl. Cancer Inst.* **13**: 1123-1137 (1953). G98,462/53

Comparison of cytologic changes produced by x-irradiation and other stressors in the mouse.

Bottiglioni, E., Sturani, P. L.: "Stress da formaldeide e tubercolosi sperimentale. Nota III. Sulle localizzazioni metastatiche nei filtri ematici" (Formalin stress and experimental tuberculosis. Note III. On metastatic localizations in the hematic filters). *Arch. Patol. Clin. Med.* **32**: 220-227 (1955). C11,775/55

In guinea pigs, formalin- or tuberculosis-induced stress produces only minor changes in the liver. [The data do not lend themselves to statistical evaluation (H.S.).]

Manzini, C.: "La degenerazione vacuolare plasmatica delle cellule epatiche come segno istologico probabile nella sindrome di adattamento di Selye" (Vacuoloplasmatic degeneration of liver cells as a probable histologic sign of Selye's adaptation syndrome). *Bull. Sci. Med.* **127**: 289-297 (1955). C10,644/55

Selye, H.: "Stress and the liver." *Il Fegato* **1**: 333-340 (1955). C7,849/55

Review of the literature and personal observations on the participation of the liver in the G.A.S., including the effect of stress hormones upon the liver, the role of the liver in the metabolism of these hormones, and changes in nonspecific resistance induced by hepatic interventions.

Cole, J. W., Leuchtenberger, C.: "Cellular changes during surgical stress. 1. Morphologic alterations in hepatic cells." *Surg. Gynecol. Obstet.* **102**: 702-704 (1956).

C18,418/56

In dogs exposed to various traumatic stressors, condensation of hepatocyte nuclear chromatin and increased nuclear-associated chromatin were noted.

Popper, H., Schaffner, F.: *Liver: Structure and Function*, p. 776. New York, Toronto and London: McGraw-Hill, Blakiston Division, 1957. E9,234/57

Review on toxic hepatic injury in man and experimental animals, including sections on liver lesions produced by immune reactions, arsphenamine, methyltestosterone, chlorpromazine and thyrotoxicosis. Nonspecific stress is probably the principal factor in the production of postoperative toxic hepatitis and hepatic lesions following anoxia, loss of blood and other systemic insults (numerous refs.).

Baxter, C. R., Teschan, P. E.: "Atypical heat stroke, with hypernatremia, acute renal failure, and fulminating potassium intoxication." *Arch. Intern. Med.* **101**: 1040-1050 (1958). C54,584/58

In patients who died from heat stroke, renal damage and hemorrhages in various organs were particularly obvious. In the liver, there was centrilobular necrosis. The literature on the pathology of heat stroke in man is reviewed (25 refs.).

Herman, R. H., Sullivan, B. H. Jr.: "Heat-stroke and jaundice." *Am. J. Med.* **27**: 154-166 (1959). C70,269/59

Review and personal observations on heat stroke with jaundice and histologic liver lesions in man (54 refs.).

Sackler, A. M., Weltman, A. S., Bradshaw, M., Jurtshuk, P. Jr.: "Endocrine changes due to auditory stress." *Acta Endocrinol. (Kh.)* **31**: 405-418 (1959).

C71,159/59

In rats, repeated exposure to strong auditory stimulation causes adrenal enlargement, ovarian atrophy and diminution in the weight of the uterus and liver. Food consumption is also markedly reduced.

Bassi, M., Bernelli-Zazzera, A., Cassi, E.: "Electron microscopy of rat liver cells in hypoxia." *J. Pathol. Bacteriol.* **79**: 179-183 (1960). G95,537/60

In mice kept under hypoxic conditions, the principal EM changes in the liver were "the presence in the cytoplasm of smooth, round vesicles, varying in size and electron-density. These vesicles do not seem to be related to mitochondria, which have generally a normal appearance, a conclusion that accords with the results of biochemical assays carried out on homogenates of hypoxic livers. Catalase, uricase and succinic-dehydrogenase-activities, which are bound to cytoplasmic particles of different size, are not altered in homogenates of vacuolated liver cells."

Arturson, G.: "Pathophysiological aspects of the burn syndrome with special reference to liver injury and alterations of capillary permeability." *Acta Chir. Scand. [Supp.]* **274**: 1-135 (1961). D15,482/61

Monograph on the burn syndrome as it appears in the rat, dog and man, with special reference to hepatic changes (dilatation of sinusoids, vacuolization of hepatocytes with ballooning of their nuclei and eventually necrosis) (approx. 300 refs.).

Hirose, S., Hirayama, C., Ikemi, Y.: "The influence of emotional stress on the liver blood flow." *Kyushu J. Med. Sci.* **12**: 319-323 (1961). D56,369/61

Pohl, W.: "Die Substruktur der Leberzelle unter hormonalen und toxischen Reizen" (Hormonal and toxic stimuli affecting the subcellular structure of the hepatocyte). *Z. Gesamte Inn. Med.* **17**: 199-203 (1962).

D31,127/62

In rats treated with EP, cortisone, thy-

roxine, insulin or carbon tetrachloride, the EM changes in the hepatocytes are essentially the same. There is swelling of mitochondria, fragmentation, and shortening of their cristae, which eventually become more or less homogeneous, irrespective of the agent used. [The stereotyped nature of the response suggests that it is the consequence of stress as such (H.S.).]

Scharf, J. H., Borysenko, M., Ehrenbrand, F.: "Aktivierung des Nebennierenrindenorgans durch Kochsalzlösungen im Zusammenhang mit der Morphokinese von Adenohypophyse, Schilddrüse und Leber bei der Ratte" (Sodium chloride solutions activating the adrenal cortex and affecting the morphokinesis of the adenohypophysis, thyroid and liver in rats). *Z. Mikrosk. Anat. Forsch.* **68**: 176-213 (1962).

D32,197/62

In rats, large amounts of hypertonic sodium chloride given orally elicit various organ changes characteristic of stress. Liver cells show pronounced shrinkage of the cytoplasm and nucleus, with a significant diminution of glycogen shortly after an initial increase, allegedly symptomatic of a toxic influence. Earlier literature is reviewed (about 130 refs.).

Brown, J. M. M.: "Biochemical lesions in the pathogenesis of geeldikkop (Tribulosis ovis) and enzootic icterus in sheep in South Africa." *Ann. N.Y. Acad. Sci.* **104**: 504-538 (1963).

D58,732/63

In sheep, the enzootic icterus produced by icterogenin and other pentacyclic triterpene acids is greatly aggravated by stressors such as long-distance traveling by road or rail, inoculation with vaccines, intercurrent diseases and so on.

Vido, I., Tomík, F.: "Morphologische Veränderungen der Leber und ihre biochemischen Begleiterscheinungen im Serum während wiederholter unspezifischer Eingriffe bei Versuchstieren" (Morphologic changes in liver and biochemical alterations in serum during repeated nonspecific interventions in experimental animals). *Acta Hepato-Splenol. (Stuttg.)* **10**: 176-181 (1963).

E21,325/63

In dogs, various interventions considered as nonspecific stimuli (repeated anesthesia, liver biopsy, hemorrhage, administration of olive oil) produce hepatic steatosis.

Lalli, G., Paolucci, G.: "Comportamento di alcune attività enzimatiche valutate in funzione del danno anatomo-patologico nel ratto sottoposto a decelerazioni di notevole

entità e di breve durata. Nota II" (Behavior of various serum enzymes in the rat in relation to the anatomo-pathologic lesions produced by deceleration of great intensity and short duration. Note II). *Riv. Med. Aero-naut. Spaz.* **26**: 410-426 (1963).

E31,375/63

In rats exposed to deceleration of great intensity and short duration, there develop hepatic lesions and serum enzyme changes.

Scharf, J. H., Saffari, E.: "Histologische, histotopochemische und sequentialanalytische Untersuchungen über die Frage des unterschiedlichen Aktivierungsgrades von Endocrinum und Leber nach Operation, Muskelhomoiotransplantation und Plastoff-implantation beim Meerschweinchen" (Histologic, histochemical and sequential analytic studies on the problem of a different degree of activation of the endocrines and liver following surgery, musculo-homoiotransplantation and implantation of plastic material in guinea pigs). *Z. Mikrosk. Anat. Forsch.* **71**: 32-84 (1964).

D19,998/64

Shoemaker, W. C., Szanto, P. B., Fitch, L. B.: "Hepatic physiologic and morphologic alterations in hemorrhagic shock." *Surg. Gynecol. Obstet.* **118**: 828-836 (1964).

F6,735/64

In dogs and rats, extensive in vivo studies on the microcirculation of the liver revealed the time sequence of the changes elicited by hemorrhagic shock. "Evidence is presented suggesting that 'acute hepatic sinusoidal congestion' may be the pathophysiological entity underlying the shocked state in both experimental hemorrhagic shock and clinical hypotensive shock from hemorrhage, trauma, and other forms of acute stress."

Minick, O. T., Kent, G., Orfei, E., Volini, F. I.: "Non-membrane enclosed intramitochondrial dense bodies." *Exp. Mol. Pathol.* **4**: 311-319 (1965).

G94,952/65

In rats, ethionine intoxication causes the appearance of nonmembrane enclosed intramitochondrial dense bodies in hepatocytes. Hypoxia elicits a considerable increase in the number of these dense bodies, which "are considered to be responses to severe though non-specific cellular injuries. They appear to be derived, at least in part, from altered groups of cristae."

Trotter, N. L.: "Electron-opaque, lipid-containing bodies in mouse liver at early intervals after partial hepatectomy and sham

operation." *J. Cell Biol.* **25**: 41-52 (1965).
G97,137/65

In mice, "as early as 10 minutes after both sham operation and partial hepatectomy, lipid-containing bodies have been observed not only in the cytoplasm of hepatic parenchymal cells, but also in the spaces of Disse. . . . The fact that only hepatic parenchymal cells contain the lipid bodies, whereas von Kupffer, endothelial lining, and Ito's fat-storing cells do not, may indicate a specific lipid mobilization response on the part of the cells of the hepatic parenchyma."

Minio, F., Gardiol, D.: "Hépatopathie périopératoire. Etude histologique, histoquímica, ultrastructural et expérimental" (Surgical hepatopathy. A histologic, histochemical, ultrastructural and experimental study). *Ann. Anat. Pathol. (Paris)* **10**: 301-316 (1965).
G92,562/65

In patients and dogs, various abdominal operations produce ultrastructural changes, especially in the vascular pole of hepatocytes and Disse's spaces, which might partly be due to anesthesia, and could explain post-operative icterus.

Webb, T. E., Blobel, G., Potter, V. R.: "Polyribosomes in rat tissues. III. The response of the polyribosome pattern of rat liver to physiologic stress." *Cancer Res.* **26**: 253-257 (1966).
F62,094/66

In rats, the polyribosome pattern of the liver undergoes similar changes following fasting, partial hepatectomy, dinitrophenol or carbon tetrachloride, presumably "in response to physiologic stress."

Petera, V., Špinka, J., Jiroušek, F., Vojáček, V., Maňhal, J., Hoenig, K.: "Acute intrahepatic cholestasis following stress." *Čas. Lék. Česk.* **105**: 464-465 (1966) (Czech).
G64,201/66

In patients, various surgical operations can produce intrahepatic cholestasis which is interpreted as a consequence of stress.

Glinsmann, W. H., Ericsson, J. L. E.: "Observations on the subcellular organization of hepatic parenchymal cells. II. Evolution of reversible alterations induced by hypoxia." *Lab. Invest.* **15**: 762-777 (1966).
G95,943/66

EM studies on the reversible alterations induced by hypoxia in the hepatocytes of rats (49 refs.).

Peters, J. M., Boyd, E. M.: "Resistance to pentobarbital in rats fed a cachexigenic diet."

Toxicol. Appl. Pharmacol. **8**: 464-471 (1966).
J1,581/66

The body weight of rats kept on a biotin-deficient rancid-fat diet decreased in proportion to the increase of hepatic weight. Simultaneously, these animals showed typical manifestations of the stress reaction and an enhanced resistance to pentobarbital. It remains to be seen whether the latter was due to hepatic enlargement or to some other stress effect.

Lambusta, A.: "Atrofia giallo-acuta del fegato e stress psico-emotivi" (Acute yellow atrophy of the liver and psycho-emotional stress). *Minerva Med. Leg.* **86**: 182-183 (1966).
J24,553/66

Kingsley, D. P. E.: "Hepatic damage following profound hypothermia and extra-corporeal circulation in man." *Thorax* **21**: 91-98 (1966).
J2,183/66

In patients who underwent cardiac surgery under profound hypothermia and circulatory arrest, evidence of hepatic damage was obtained from several enzyme changes and in a few cases centrilobular necrosis was noted postmortem.

Dietze, A.: "Leberschädigung und Tod nach Überstehen extremer Lebensverhältnisse" (Investigation of the cause of death and of liver damage in persons surviving extreme living conditions). *Acta Hepato-Splenol. (Stuttg.)* **14**: 105-109 (1967).
F95,153/67

Autopsies on more than three hundred former POWs who had lived under extremely stressful conditions. In 15 percent the immediate cause of death was liver disease; in an additional 8 percent, there was liver disease associated with other fatal lesions. These percentages are considerably higher than in ordinary autopsies, but this study does not reveal the relative role of stress, captivity and malnutrition in causing the hepatic damage.

Kerr, J. F. R.: "Lysosome changes in acute liver injury due to heliotrine." *J. Pathol. Bacteriol.* **93**: 167-174 (1967).
G91,076/67

In rats, sublethal doses of heliotrine induced a great variability in the size and distribution of hepatocyte lysosomes. Large, spherical lysosomes were especially numerous in the most severely damaged cells. They contained both acid phosphatase and esterase. In coagulative necrosis, there was diffuse staining of the paracanalicular cytoplasm

in hydrolase preparations. Similar lysosome changes were previously observed in ischemia and probably "represent standard reactions to injury, irrespective of its cause."

Šimek, J., Erbenová, Z., Deml, F., Dvořáčková, I.: "Liver regeneration after partial hepatectomy in rats exposed before the operation to the stress stimulus." *Experientia* **24**: 1166-1167 (1968).

H13,837/68

In partially hepatectomized rats, exposure to various stressors or treatment with ACTH enhances DNA synthesis in the liver remnant as well as hepatic regeneration and triglyceride storage.

Schattenfroh, C., Stracke, U., Eger, W.: "Änderung der Leberfunktion durch Tourniquet, Mesenterialgefäßligatur und Immobilisation im Tierexperiment" (Change in liver function due to tourniquet, mesenteric vessel ligation and immobilization in animal experiments). *Brun's Beitr. Klin. Chir.* **216**: 560-568 (1968).

J22,743/68

In rats, stress induced by traumatic injuries offers immediate protection against the hepatic necrosis normally produced by allyl alcohol.

Tsukada, K., Moriyama, T., Doi, O., Lieberman, I.: "Ribosomal change in liver after partial hepatectomy and acute stress." *J. Biol. Chem.* **243**: 1152-1159 (1968).

E9,960/69

Review on postoperative jaundice in man (150 refs.).

Cook, G. C.: "Hepatic changes associated with shock." *Int. Anesthesiol. Clin.* **7**: 883-894 (1969).

G98,418/69

Review on hepatic changes associated with postoperative shock in man (26 refs.).

Ionescu, A., Chiotan, N., Paulian, V.: "Intravital and post-mortem study of liver structure changes in the burned." *Panminerva Med.* **11**: 47-50 (1969).

G98,803/69

Detailed description of histologic changes in the liver of severely burned patients.

Müller, R., Korb, G., Gedigk, P.: "Über zentrale Nekrosen in der Leber nach einem Schock" (Central liver necrosis after shock). *Verh. Dtsch. Ges. Pathol.* **54**: 511-513 (1970).

G96,741/70

In man the hepatic changes after shock (particularly surgical trauma) are essentially similar to those previously described in animals, and consist mainly of single-cell, reticular and zonal central necroses. The literature is reviewed.

Mori-Chavez, P., Upton, A. C., Salazar, M., Conklin, J. W.: "Influence of altitude on late effects of radiation in RF/Un mice: observations on survival time, blood changes, body weight, and incidence of neoplasms." *Cancer Res.* **30**: 913-928 (1970).

H27,012/70

In mice exposed to total body x-irradiation and reduced oxygen tension, neoplasms occurred in various organs. "The liver occasionally disclosed multiple, pinpoint, umbilicated, necrotic foci on its surface, which microscopically were found to consist of thromboembolic septic abscesses."

Panaretto, B. A., Vickery, M. R.: "The rates of plasma cortisol entry and clearance in sheep before and during their exposure to a cold, wet environment." *J. Endocrinol.* **47**: 273-285 (1970).

H28,932/70

In sheep exposed to cold, "decreased cortisol clearance rates did not appear to contribute to the great increases in plasma concentration until rectal temperature was about 34°." Curiously, the adrenal cortex and liver of the sheep were heavily infiltrated with fat after severe hypothermia.

Paolucci, G.: "Effetti delle decelerazioni ripetute di modesta entità e di brevissima durata in animali da esperimento" (The effects of repeated moderate decelerations of very brief duration on scientific research animals). *Riv. Med. Aeronaut. Spaz.* **33**: 88-99 (1970).

H57,012/70

Repeated moderate decelerations cause no immediate macroscopic change, but after a certain time they lead to hepatic cirrhosis in some species.

Kerr, J. F. R.: "Shrinkage necrosis: a distinct mode of cellular death." *J. Pathol.* **105**: 13-20 (1971). G90,887/71

In rats, ligation of portal vein branches causes massive loss of hepatocytes through "shrinkage necrosis" in the corresponding lobes. There is cellular condensation, followed by prolific budding of compact masses, often referred to as "Councilman bodies." These are ingested by hepatocytes and histiocytes, whereupon they undergo changes similar to coagulative necrosis of whole cells. The eventual degradation of these bodies is brought about by lysosomal enzymes. Shrinkage necrosis is regarded as a distinct type of cell death caused by various noxious stimuli. The literature on the formation of Councilman bodies in man and experimental animals is reviewed (23 refs.).

Adam, S. E. I., Thorpe, E.: "Influence of cold environment on hepatic changes produced by repeated doses of carbon tetrachloride." *J. Pathol.* **106**: 155-163 (1972).

G92,088/72

In mice given a single oral dose of carbon tetrachloride, centrilobular hepatic necrosis developed at room temperature. Exposure to a cold environment caused greater lipid accumulation and marked glycogen depletion in the liver, with increased "ballooning" of midzonal hepatocytes. Repeated administration of carbon tetrachloride at weekly intervals led to greater resistance at room temperature than in the cold. Histochemically, alkaline phosphatase and ATPase activity was greatest in the necrotic cells and the adjacent sinusoids.

Bianchi, L., Ohnacker, H., Beck, K., Zimmerli-Ning, M.: "Liver damage in heat-stroke and its regression. A biopsy study." *Hum. Pathol.* **3**: 237-248 (1972).

G94,903/72

Two patients with heat stroke developed

centrilobular hepatic necrosis, cholestasis and leukocytic cholangiolitis.

Oette, K., Phlippen, R.: "Fettleber durch Stress?" (Fatty liver due to stress?). *Dtsch. Med. Wochenschr.* **98**: 1635-1636 (1973). H75,594/73

Tentative clinical observations suggest but do not prove that repeated exposure to stressors can predispose to fatty degeneration of the liver in man.

Remmeli, W., Loeper, H.: "Zur pathologischen Anatomie des Kreislaufschocks beim Menschen. IV. Pathomorphologie der Schockleber" (The pathology of circulation shock in man. Pathomorphology of the liver). *Klin. Wochenschr.* **51**: 10-24 (1973).

H65,988/73

Review on the pathology of shock-induced hepatic changes in man (66 refs.).

Rotermund, A. J. Jr., Johnson, H. A.: "Temperature-induced alteration of hepatic ultrastructure and function within the goldfish, *Carassius auratus*" (abstracted). *Physiologist* **17**: 389 (1974). H89,987/74

Kalant, H., Khanna, J. M., Seymour, F., Loth, J.: "Acute alcoholic fatty liver. Metabolism or stress." *Biochem. Pharmacol.* **24**: 431-434 (1975). H98,210/75

Comparative studies on the biochemistry of fatty liver formation in rats given ethanol, exposed to a new environment, or stressed by both these agents.

Salas, M., Tuchweber, B.: "Effect of stress on the liver ultrastructure." *Proc. Can. Fed. Biol. Soc.* (In press). J4,286/

In rats, various stressors (restraint, spinal cord transection, heat, cold, forced exercise) and cortisol injections caused a decrease in hepatic weight and rectal temperatures, concurrently with the typical triad of the alarm reaction. The hepatocytes showed EM evidence of RER degranulation, SER proliferation, glycogen depletion, slight lipid accumulation, mitochondrial enlargement and numerous lysosomes. The most striking change was an increase in the number of autophagic vacuoles.

Connective Tissue, Wound Healing, Regeneration and Inflammation

One of the most striking effects of systemic stress is its ability to influence connective tissue, especially in the presence of topical stress causing inflammation or necessitating wound healing and scar formation. In fact, one of the first observations on the

therapeutic effect of glucocorticoids was the demonstration of their antiphlogistic actions in experimental inflammation (topical irritation arthritis test, granuloma pouch test, anaphylactoid inflammation, cotton pellet granulomas, adjuvant polyarthritis), and in typical inflammatory diseases such as rheumatoid arthritis, various forms of dermatitis, conjunctivitis and so on.

Such anti-inflammatory effects are obtained both by endogenous secretion of glucocorticoids during systemic stress and by exogenous administration of these compounds or their artificial synthetic homologues. In very large doses, glucocorticoids also interfere with wound healing and scar formation.

By using the granuloma pouch technique, it could be shown that both cortisone and stress (restraint) exert their maximal antiphlogistic effects during a "*critical period*" on about the third day after local application of an inflammatory irritant.

Under certain conditions, even *calciphylaxis* can be inhibited by glucocorticoids, particularly if tissue calcification occurs under the influence of a mast cell discharge in the course of anaphylactoid inflammation.

Recently, a good deal of work has been published on the "*nonspecific mesenchymal reaction*," which develops during both systemic and topical stress and is characterized by increased incorporation of ^{35}S -sulphate into connective tissue.

Connective Tissue, Wound Healing, Regeneration and Inflammation

(See also our earlier stress monographs, p. xiii)

Selye, H.: "Studies on adaptation." *Endocrinology* **21**: 169-188 (1937). 38,798/37

First description of the anaphylactoid inflammation produced in the rat by parenteral administration of egg white. This response is aggravated by adrenalectomy, and hence presumably some adrenal factor has antiphlogistic effects. The experiment also shows that "in this case an alarm reaction, elicited by another drug, exerted a protective influence" against egg white. Thus we are dealing with a type of cross-resistance.

Selye, H.: "The 'critical period' in the development of inflammation." *Acta Physiol. Lat. Am.* **3**: 188-193 (1953). B85,700/53

In rats with granuloma pouches produced by croton oil, cortisone inhibits exudate formation most markedly during a "critical period" at about the third day of local stress.

Review on the effect of systemic stress and stress hormones upon inflammation (13 refs.).

Swingle, W. W., Maxwell, R., Ben, M., Fedor, E. J., Baker, C., Eisler, M., Barlow, G.: "Epinephrine and resistance of hypophysectomized and adrenalectomized rats to stressor agents." *Am. J. Physiol.* **177**: 1-6 (1954). B93,484/54

The 24-hour adrenalectomized rat is extremely sensitive to intravenous infusions of globin and dextran, and reacts to both by an anaphylactoid syndrome terminating fatally in 87-93% of the animals. Prophylactic foretreatment with cortisone confers adequate protection. The hypophysectomized rat, despite severe atrophy of the cortex, does not exhibit symptoms when similarly infused. However, when the adrenals are removed from such animals they become sensitized and die within a few minutes after infusion. Medullectomized rats lacking adrenal medullae, but with well regenerated cortices are also quite sensitive and most of them succumb when infused. The data indicate that epinephrine, released from the intact medulla by the stress of infusion, is the agent

responsible for the surprising resistance shown by these hypophysectomized rats. Confirmation was obtained by markedly increasing resistance of adrenalectomized as well as adrenalectomized-hypophysectomized rats to globin by repeated pre- and postinfusion injections of epinephrine. Apparently the amine antagonizes the toxic action upon the peripheral circulation of some agent (possibly histamine) released from tissue cells by globin and dextran infusion, and thus prevents the anaphylactoid response to these two stressor agents."

Selye, H.: "Role of the quotient stressor/tissue in inflammation." *Arch. Int. Pharmacodyn. Ther.* **97**: 379-388 (1954).

B86,264/54

Experiments on rats suggest that "if a given tissue-area is exposed to various dilutions of croton oil, there is, within limits, a proportionality between the strength of the irritant and the intensity of the resulting inflammation (as expressed by exudation and granuloma formation). However, a near-maximal result is obtained, at relatively low concentrations of croton oil and, by further raising the strength of the irritant, the phlogistic response cannot be proportionately augmented. Similarly, if the same amount of croton oil is applied to varying areas of tissue-surface, the phlogistic response rises rapidly, in proportion with the tissue-area affected. Yet, here again, the response does not rise, and may even decline, after the contact-area is raised above a certain optimum. Cortisol, whether administered systemically, or topically, exerts its antiphlogistic actions (as regards exudation and granuloma formation) most effectively, under those conditions which, without the hormone, would have enabled a given amount of irritant to elicit a maximal response. In our experimental arrangement, this was the case, when a connective-tissue compartment was delimited by 25 ml. of air, and irritated by the topical application of 0.5 ml. of an 0.25% solution of croton oil in corn oil."

Selye, H.: "'Critical period' for inhibition of inflammation by a primarily neurogenic stress-situation." *Psychosom. Med.* **17**: 124-127 (1955).

B88,520/55

"Inflammation, produced by means of the 'granuloma-pouch' technique, permits the objective volumetric assessment of exudation under strictly standardized conditions. By transient, forcible immobilization, a primarily neurogenic stress-situation can be induced which is highly effective in suppressing this type of inflammation." The literature on the antiphlogistic effect of stress and stress-induced hyperglucocorticoidism is briefly surveyed, and its relationship to psychosomatic diseases of adaptation is emphasized, since forced restraint as used in the present experiments is regarded primarily as a neurogenic stressor.

Selye, H., Jasmin, G.: "Screening of possible therapeutic agents by means of experimental replicas of connective-tissue diseases." *Ann. N.Y. Acad. Sci.* **64**: 481-493 (1956).

C10,860/56

Summary of the laboratory tests recommended for the study of inflammation and drugs which modify its course. For this purpose, the authors recommend the following tests in the rat: a granuloma-pouch test, the topical-irritation arthritis test, the experimental polyarthritis produced by Murphy Rat Lymphosarcoma tissue (presumably because it contains PPLO), the anaphylactoid reaction to mast cell discharges, and the "hyalinosis" with its characteristic cardiovascular inflammatory changes produced by DOC.

G99,625/72

In rats with very long skin flaps which normally undergo partial necrosis, stress (restraint) distinctly diminished skin survival, but this could be inhibited by α -adrenergic blocking agents, presumably because they prevent vasoconstriction. [Since the skin flap, even at the end farthest removed from its attachment to normal skin,

was equivalent to an autotransplant which usually heals without necrosis in the absence of all vascular connections, it is difficult to understand why this was not the case here (H.S.).]

H80,857/74

Haptoglobin, the plasma glycoprotein, is synthesized in the liver of rats under the influence of corticosterone, and represents a fairly accurate index of the intensity of in-

flammatory reactions. In rats injected with turpentine, the fastest and highest haptoglobin levels occur concurrently with maximum corticosterone hypersecretion after injections at 09:00, while persistently low haptoglobin levels result from phlogogen administration at the time of lowest circadian adrenal reactivity (03:00). "These data are consistent with the concept of an adrenocortical control of haptoglobin biosynthesis."

In rats, restraint causes degranulation of mast cells with liberation of histamine, 5-HT

and heparin. These substances may have a role in the mechanism of vascular reactions during stress.

Billewicz-Stankiewicz, J., Krępińska-Urbaniak, A.: "The effect of vibration and noise on development of inflammatory reaction in rats." *Acta Physiol. Pol.* **25**: 235-240 (1974). J23,160/74

Cohen, I.: "Stress and wound healing," p. 112. Thesis, City University of New York, 1975. E10,838/75

Doctoral dissertation on the effect of stressors (noise, heat, cold) upon wound healing in the mouse. The effect depends largely upon whether the stressor is applied before or after the wound.

Skin

In the rat, epidermal mitotic activity diminishes during stress, perhaps owing to the antimitotic effect of corticoids.

In tree shrews, the hairs on the tail normally lie flat, but they become erect and bushy at the slightest stimulation, and thus act as a readily appraisable indicator of increased sympathetic activity—for example, during stress.

Skin

(See also our earlier stress monographs, p. xiii)

Bullough, W. S.: "Stress and epidermal mitotic activity. I. The effects of the adrenal hormones." *J. Endocrinol.* **8**: 265-274 (1952). B72,094/52

In rats the stress of overcrowding causes a more pronounced increase in the size of the adrenal medulla than of the cortex. The epidermal mitotic rate simultaneously decreases by sixty percent. "It is suggested that the antimitotic effects of stress may be due to a high rate of secretion of either or both of these adrenal hormones" (corticoids and catecholamines). All these reactions are regarded as manifestations of the G.A.S.

Bullough, W. S.: "Stress and epidermal mitotic activity. II. The effects of the sex hormones." *J. Endocrinol.* **8**: 365-376 (1952). B75,211/52

In mice, glucocorticoids inhibit epidermal mitotic activity, although this action may be influenced by sex hormones. The possibility that this effect of the glucocorticoids may

become apparent during stress is mentioned but not discussed in detail.

Katzberg, A. A.: "Epidermal cells and environmental stress." *Anat. Rec.* **136**: 339 (1958). J11,442/58

In man a variety of stressors (temperature variations, light, dessication, mechanical friction, microorganisms) affect both fetal and adult epidermal cells in a nonspecific manner so that "they respond with an attempt at accommodation by an alteration of the cytomorphological pattern and a decrease in their life span." [The brief abstract does not lend itself to evaluation (H.S.).]

Bullough, W. S., Laurence, E. B.: "Stress and adrenaline in relation to the diurnal cycle of epidermal mitotic activity in adult male mice." *Proc. R. Soc. Lond. Biol.* **154**: 540-556 (1961). E90,812/61

Kreyberg, L., Evensen, A., Iversen, O. H.: "Influence of stress on the diurnal rhythm in the mitotic activity in the epidermis of hairless mice." *Acta Pathol. Microbiol. Scand.* **64**: 176-184 (1965). G31,802/65

In hairless mice, epidermal mitotic counts show regular circadian variations due to the

duration, not the rate, of mitoses. This is true even after the circadian rhythmicity has been markedly changed by "acoustic stress."

Holst, D. von: "Sozialer Stress bei Tupaias (*Tupaia belangeri*). Die Aktivierung des sympathischen Nervensystems und ihre Beziehung zu hormonal ausgelösten ethologischen und physiologischen Veränderungen" (Social stress in *Tupaia* [*Tupaia belangeri*]. Activation of the sympathetic nervous system and its relation to hormonal stimulated etho-

logic and physiologic changes). *Z. Vergl. Physiol.* **63**: 1-58 (1969). G90,282/69

In the tree shrew the hairs on the tail normally lie flat, but become erect and bushy at the slightest stimulation. Thus, they act as a readily appraisable indicator of sympathetic activity. This response is elicited especially by other members of the species through sexual excitation or aggression. On the basis of studies on the mechanism of this reaction, "an attempt to interpret the results according to Selye's 'general adaptation syndrome' is made" (several hundred refs.).

Reticuloendothelial System (RES)

It is practically impossible to deal separately with the functional and morphologic aspects of RES activity, and hence these will be considered together here.

One of the earliest observations concerning the behavior of the RES was that following intravenous injection of India ink in rats exposed to various stressors, phagocytosis of the carbon particles was increased in the lung, kidneys, adrenals, bone marrow and hibernating gland. "In the spleen which undergoes marked atrophy during the alarm reaction, there was a slight decrease in the India ink phagocytosis." It was concluded that the RES participates actively in the G.A.S. Possibly, the apparently increased ink deposition during the alarm reaction reported in these earliest experiments might have been due to the use of preparations not sufficiently stabilized to prevent precipitation of the carbon particles, and their agglutination in capillaries may have been enhanced by stress. This could have been responsible for the increased ink deposition in various organs.

The phagocytic activity of the RES is considerably diminished after major abdominal surgery in dogs; allegedly this defect can be prevented by passive opsonin administration. Preliminary findings suggest that a depletion of opsonic protein, and the hypothalamic-adrenocortical axis are involved in this response.

In both children and rats a plasma "humoral recognition factor" essential for optimal phagocytosis is depleted after burns, which may partly explain the increased susceptibility to infection.

Following pretreatment with stressors, ACTH or glucocorticoids, intravenous thorium dextrin produces thrombohemorrhagic necroses in the adrenals and liver of the rat, reminiscent of the Shwartzman-Sanarelli phenomenon.

Reticuloendothelial System (RES)

(See also our earlier stress monographs, p. xiii)

Timiras, P. S., Selye, H.: "On the participation of the reticulo-endothelial system in the alarm reaction." *Science* **110**: 560-561 (1949). B36,271/49

Following intravenous injection of India ink in rats stressed by cold, spinal cord transection or forced exercise, the lungs,

kidneys, adrenals, bone marrow and "hibernating gland" exhibited increased ink deposition. "In the spleen, which undergoes marked atrophy during the alarm reaction, there was a slight decrease in the India ink phagocytosis." The experiment suggests an active participation of the RES "in the defense of the organism during the alarm reaction."

Zweifach, B. W., Benacerraf, B., Thomas,

L.: "The relationship between the vascular manifestations of shock produced by endotoxin, trauma, and hemorrhage. II. The possible role of the reticulo-endothelial system in resistance to each type of shock." *J. Exp. Med.* **106**: 403-414 (1957) (24 refs.).
G22,062/57

Zweifach, B. W., Benacerraf, B.: "Effect of hemorrhagic shock on the phagocytic function of Kupffer cells." *Circ. Res.* **6**: 83-87 (1958). E55,634/58

In rats, hemorrhagic shocks greatly decrease the phagocytic ability (colloidal carbon) of the Kupffer cells. "Histologic evidence suggests two possibilities: a localized impairment of Kupffer cell activity in the area about the central veins of the lobule, or an abnormal circulation through preferential pathways restricted to the periphery of the liver lobule."

Chiovato, I.: "Stress e poteri immunitari. Comportamento del potere fagocitario nello shock da eviscerazione" (Stress and immunologic capacity. Behavior of the phagocytic capacity in the shock of evisceration). *Rass. Med. Sper.* **9**: 70-73 (1962).

Loegering, D. J., Saba, T. M.: "Systemic hypoopsonemia and reticuloendothelial failure during hemorrhagic hypotension in dogs." *Physiologist* **17**: 275 (1974). H89,922/74

Goldman, A. S., Rudloff, H. B., McNamee, R., Loose, L. D., Luzio, N. R. di: "Deficiency of plasma humoral recognition factor activity following burn injury." *J. Reticuloendothel. Soc.* **15**: 193-198 (1974). J12,833/74

"Plasma humoral recognition factor activity, which is essential for optimal phagocytosis, is significantly depleted in severely burned children, both in the presence or absence of bacteremia, as well as in burned rats." This may explain the increased susceptibility to infection following thermal injury (30 refs.).

Won, W. D., Ross, H. C.: "Catecholamine and phagocytic responses in infected mice exposed to hyperbaric helium-oxygen atmospheres." *Aviat. Space Environ. Med.* **46**: 191-193 (1975). J22,139/75

In mice in which stress was elicited by exposure to a helium-oxygen atmosphere, "hyperbaricity induced an acute depression in phagocytic activity and a marked elevation in the circulating levels of epinephrine, norepinephrine and dopamine."

Tumors

[Cf. Tumors under Diseases of Adaptation and Stressors and Conditioning Agents]

The development of neoplastic tissue can also be influenced by stress. Thus, in mice, stressors capable of causing thymic lymphatic involution produce similar regressive changes in malignant lymphoid tissue, although to a much lesser extent.

In leukemic strains of mice, fighting among males allegedly tends to delay the development of the disease, presumably through increased production of glucocorticoids. However, these claims are contradicted by other investigators. In any event, not all types of neoplastic tissue react the same way; indeed, according to certain studies, stress enhances the development of metastases in tumor-bearing experimental animals.

Tumors

In rats, the incidence of mammary tumors induced by 7,12-dimethylbenz(α)anthracene tends to be diminished by stressors, but the results are not striking (27 refs.).

Cole, W. H.: "The mechanisms of spread of cancer." *Surg. Gynec. Obstet.* **137**: 853-871 (1973). H77,359/73

Review of the literature indicating that various stressors enhance tumor metastasis in experimental animals (125 refs.).

Pradhan, S. N., Ray, P.: "Effects of stress on growth of transplanted and 7,12-dimethylbenz[α]anthracene-induced tumors and their modification by psychotropic drugs." *J. Natl. Cancer Inst.* **53**: 1241-1245 (1974). J24,475/74

Various stressors (restraint, sound, electroshock) increased the growth of transplanted or induced tumors in rats concomitantly with an increase in adrenal and a decrease in splenic weight. Chlorpromazine abolished this protective action.

Other Morphologic Changes

The literature on other morphologic changes is too scanty to warrant separate discussion. However, we might briefly mention that some investigations, listed in the abstract section, indicate that stress may affect the nucleus pulposus in the *intervertebral discs*, the *external lacrimal glands* of the rat, various elements of the *nervous system*, the "hibernating gland," *brown adipose tissue* and *skeleton*.

Other Morphologic Changes

(See also our earlier stress monographs, p. xiii)

Chitty, D., Chitty, H., Leslie, P. H., Scott, J. C.: "Changes in the relative size of the nucleus in the intervertebral discs of stressed Orkney voles (*Microtus orcadensis*)."*J. Pathol. Bacteriol.* **72**: 459-469 (1956).

C32,079/56

In Orkney voles, stress was produced by provoking fighting, chasing and superficial wounding. "The more severely wounded ani-

mals, in comparison with their litter-mate controls, had higher liver, spleen, adrenal and bodyweights, a smaller thymus and a relatively larger cross-sectional area of *nucleus pulposus*." It had previously been suggested that stress may cause disc lesions in man.

Vlăšin, Z., Filkuka, J.: "Beeinflussung der Stressantwort des Thymus und der Hibernationsdrüse der Ratte durch Veränderung der Reaktionslage des Nervensystems" (Modification of stress response of thymus and hibernating gland of rat by change in

reactive state of nervous system). *Naunyn Schmiedebergs Arch. Pharmacol.* **227**: 414-426 (1956). J25,025/56

In rats, the thymolysis and the degranulation of the *hibernating gland* elicited by formalin-induced stress is prevented by adrenalectomy.

Croce, G.: "Lo 'stress' uditorio e le sue riverberazioni extralabirintiche" (Noise stress and its extra-labyrinthine repercussions). *Valsalva* **40**: 381-384 (1964).

J10,965/64

No definite changes were noted in the *extra-orbital lacrimal gland* of the rat upon exposure to the stress of noise.

Ichiki, H., Usui, K.: "Studies on the bone disorder of rats caused by heavy exercise. I. Etiology." *Jap. J. Vet. Sci.* **28**: 45-56 (1966).

J24,915/66

In rats, prolonged forced swimming caused typical G.A.S. manifestations accompanied by a decrease in the nitrogen content of the *bones*, as well as osteoporosis, similar to the changes produced by glucocorticoids.

Gabrielescu, E.: "The lability of lysosomes during the response of neurons to stress." *Histochem. J.* **2**: 123-130 (1970).

G75,574/70

In guinea pigs and rats, histochemical studies on neurolyssosomes (acid phosphatase test) in certain regions of the *brain* showed increased lability after stress induced by physical efforts, acceleration, hyperthermia and emotional arousal.

Dropp, J. J., Sodetz, F. J.: "Autoradio-

graphic study of neurons and *neuroglia* in autonomic ganglia of behaviorally stressed rats." *Brain Res.* **33**: 419-430 (1971).

J20,190/71

Linck, G., Petrovic, A.: "Does brown adipose tissue of the European hamster (*Cricetus cricetus*) store and synthesize corticosteroids? The isolation of a corticosteroid-like compound." *Arch. Sci. Physiol.* **26**: 85-100 (1972).

J11,335/72

Brief survey of the literature suggesting that the brown adipose tissue or "*hibernating gland*" of the rat, which reacts to cold like the adrenal by releasing lipid granules, contains a "survival principle." The hibernating gland cells of the hamster produce a corticoid-like principle in vitro. [It remains to be seen whether this plays any role in resistance to stress (H.S.).]

J13,050/74

FUNCTIONAL CHANGES

The effects of stress upon the sex organs (including pregnancy and lactation), gastrointestinal system, salivary glands, lung, kidney, liver and various other organs are arbitrarily discussed under Morphologic Changes in order not to duplicate many findings that refer to both structural and functional changes.

Resistance

Many observations on the triphasic variations of resistance during chronic exposure to stress have demonstrated the characteristic decrease in resistance during the alarm reaction, the increase in the stage of resistance and the final decline during the stage of exhaustion. These have been discussed in the General Outline, whereas the phe-

nomena of cross-resistance and cross-sensitization have received adequate attention in the section on the effects of exposure to Multiple Stressors; hence, here it will suffice to give a few key references.

Resistance

(See also our earlier stress monographs, p. xiii, and cf. the section on Multiple Stressors)

Renaud, S.: "The toxicity of kanamycin and bacitracin as influenced by stress and sodium chloride." *Toxicol. Appl. Pharmacol.* **2**: 708-714 (1960). C85,849/60

In rats, the myocardial lesions produced by kanamycin and bacitracin resulted in particularly severe nephrocalcinosis, such as had previously been caused with neomycin plus stress. However, cardiac lesions were not obtained after treatment with neomycin plus stress.

Geschickter, C. F., O'Malley, W. E., Rubacky, E. P.: "A hypersensitivity phenomenon produced by stress: the 'negative phase' reaction." *Am. J. Clin. Pathol.* **34**: 1-8 (1960). C88,483/60

Various stressors inhibit the anaphylactoid reaction produced by egg white in the rat, but this may be followed by a "negative phase" of hypersensitivity. "Although the 'negative phase' is similar to Selye's exhaustion stage of the general adaptation syndrome, it differs by being a more acute, frequent, and repetitive occurrence, and of a lesser degree of severity than that observed with exhaustion."

Marino, A.: "Physical stress and emetine cardiotoxicity." *Experientia* **17**: 116-117 (1961). D4,522/61

In guinea pigs, the stress of forced swimming increases the cardiotoxicity of emetine.

Marino, A.: "Psychological stress and emetine cardiotoxicity." *Experientia* **17**: 117-119 (1961). D6,102/61

Leikola, A.: "Influence of stress on alcohol intoxication in rats." *Q. J. Stud. Alcohol* **23**: 369-375 (1962). D38,054/62

Rats stressed by swimming exhibited an accelerated clearance of orally-administered ethanol. Upon intraperitoneal treatment, they showed the same alcohol concentrations in blood as unstressed animals. "The stressed rats, however, were less intoxicated than the unstressed animals with corresponding blood

alcohol levels." Possibly, adrenal hormones released during stress may be responsible for this increased tolerance.

Marino, A., Parise, A., Galdi, R.: "Stress psicologico e cardiotossicità strofantinica" (Psychologic stress and strophanthin cardio-toxicity). *Arch. It. Sci. Farmacol.* **13**: 208-209 (1963). G19,379/63

In guinea pigs, the cardiotoxicity of strophanthin is enhanced by exposure to various stressors.

Rupe, B. D., Bousquet, W. F., Miya, T. S.: "Stress modification of drug response." *Science* **141**: 1186-1187 (1963).

E26,910/63

In rats, tourniquet stress decreases the toxicity of various drugs that can be metabolized by hepatic enzymes. "The effect of stress on drug response is not noted with barbital, a compound which is not metabolized; this effect is inhibited by treatment of the animal with a drug metabolism inhibitor such as SKF 525-A." Similar actions are obtained with ACTH or corticosterone. "Compounds which can stimulate adrenocorticotrophic hormone secretion or act directly on the adrenals to produce corticosteroids should thus be able to stimulate their own metabolism or that of other drugs."

Bajusz, E., Jasmin, G., Mongeau, A.: "Dissociation by forced muscular exercise of the cardiotoxic from the myotoxic actions of plasmocid." *Rev. Can. Biol.* **23**: 29-36 (1964). F9,053/64

Forced muscular exercise, restraint, fasting or cold environmental temperatures counteract the cardiotoxic effects of plasmocid on the one hand, and enhance its myotoxic properties on the other, so that the skeletal muscle becomes affected.

Marino, A.: "Influence of psychological stress on the specific cardiotoxicity of drugs." *Nature* **203**: 1289-1290 (1964).

F21,708/64

In guinea pigs, "psychological stress was able to potentiate the specific cardiotoxicity of emetine, strophanthin, pitressin and hypertensine. Research in progress is showing similar results with thyroxin and adrenaline. Moreover, we found promazine, a psycho-

tropic drug, and 'Persantin,' a coronary vasodilator, especially when combined, to exert a highly significant protection against the experimental cardiopathy [produced] by psychological stress and pitressin. Such a protection was also shown by mebutamate, a centrally acting drug with hypotensive and tranquillizer effects, against the cardiopathy induced by psychological stress and strophanthin or hypertensine."

Selye, H., Tuchweber, B., Gabbiani, G.: "Protection by restraint against parathyroid hormone intoxication." *Acta Endocrinol. (Kbh.)* **45** Supp. 90: 203-209 (1964).

E24,101/64

In rats, restraint offers complete protection against the osteitis fibrosa and soft tissue calcification normally produced by large doses of parathyroid extract.

Stahnke, H. L.: "Stress and the toxicity of venoms." *Science* **150**: 1456-1457 (1965).

F57,253/65

Resistance to scorpion or rattlesnake venom is diminished by previous exposure to various stressors.

Lal, H., Chessick, R. D.: "Lethal effects of aggregation and electric shock in mice treated with cocaine." *Nature* **208**: 295-296 (1965).

F54,339/65

Lee, N. H., Hospador, M. A., Manthei, R. W.: "Influence of age and dietary stress on hexobarbital activity in mice." *Proc. Soc. Exp. Biol. Med.* **125**: 153-156 (1967).

F80,166/67

On an 8 percent casein diet, mice can still synthesize drug-metabolizing enzymes despite rapid growth. However, hexobarbital sleeping time is prolonged, perhaps because of a less active TPNH generating system.

Schattenfroh, C., Stracke, U., Eger, W.: "Änderung der Leberfunktion durch Tourniquet, Mesenterialgefäßligatur und Immobilisation im Tierexperiment" (Change in liver function due to tourniquet, mesenteric vessel

ligation and immobilization in animal experiments). *Brunns Beitr. Klin. Chir.* **216**: 560-568 (1968).

J22,743/68

In rats, stress induced by traumatic injuries offers immediate protection against the hepatic necrosis normally produced by allyl alcohol.

Goldberg, M. E., Salama, A. I.: "Amphetamine toxicity and brain monoamines in three models of stress." *Toxicol. Appl. Pharmacol.* **14**: 447-456 (1969).

G66,997/69

In the mouse and rat, a significant rise in the level of brainstem 5-HT was caused by trauma or electroshock but not by cold. "This increase was obtained in animals subjected to stress alone, or those given the highest possible nonlethal dose of amphetamine. These same doses did not augment the catecholamine-releasing properties of amphetamine in drum- or electric shock-stressed animals. It does not appear that stress potentiates the effects of amphetamine, as no evidence of excitation was obtained in stressed animals given amphetamine. It is postulated that amphetamine enhances the effects of stress."

Ermolov, V. I.: "Effects of disturbance of the normal course of pregnancy in dogs on development of natural immunity in the progeny." *Biull. Èksp. Biol. Med.* **71** No. 3: 64-66 (1971) (Russian). Engl. trans.: *Bull. Exp. Biol. Med.* **71** No. 3: 285-287 (1971).

J21,617/71

In dogs exposed to stressors during pregnancy, "the immunologic properties of the blood of the fetuses and newborn puppies were appreciably weakened. The phagocytic response was depressed most sharply, and this was accompanied by a decrease in the digestive power of the leukocytes. Weakening of the immunobiological properties led to the appearance of inflammation in the lungs and intestine by the action of the automicr flora and was responsible for death of a large proportion of the newly born animals."

Nervous System

Generalities. Among the functional disturbances characteristic of stress, neuropsychologic changes play a very important role, especially in man, because of his highly developed and sensitive CNS. It is particularly difficult to present the enormous amount

of relevant literature in an orderly fashion because of the many overlaps between the central nervous alterations produced by stress, such as various forms of performance, learning, emotional changes, cravings for food and drugs (including alcohol), accident proneness and so on. Hence, the available data had to be more or less arbitrarily subdivided according to the most pertinent topics.

It is sometimes difficult to differentiate between simple impairments of neuropsychologic functions and psychologic defense mechanisms, such as narcissism, submission to a higher power (God, fate, a leader or doctors), masochistic attempts at self-punishment, or a type of deeper depersonalization. The establishment of a feeling of unreality also helps to protect against frightening psychogenic stress.

Additional pertinent information may be found in the subsequent section on Stress Tests (many of which are based upon mental reactions), as well as in the chapter on Theories (which will deal with the morphologic and neurohumoral alterations induced in the nervous system by stress).

Nervous System

(See also our earlier stress monographs, p. xiii)

Generalities. Russell, R. W.: "Behaviour under stress." *Int. J. Psychoanal.* **34** Supp.: 1-12 (1953). D87,619/53

A lecture before the British Psycho-Analytical Society summarizing the G.A.S., with special emphasis upon behavioral changes induced by stress.

Menninger, K. A.: "Psychological aspects of the organism under stress." *Gen. Systems* **2**: 142-172 (1954). C3,535/54

Detailed review of the literature on common psychologic causes of stress, with special reference to the homeostatic regulatory function and devices of the ego under major stress, in relation to the G.A.S. (99 refs.).

Schaffer, H. R.: "Behavior under stress: a neurophysiological hypothesis." *Psychol. Rev.* **61**: 323-333 (1954). D77,848/54

On the basis of an analysis of pertinent publications, the "hypothesis is here advanced that under stress a shift in emphasis occurs from cortical to subcortical centers, and that consequently behavior under stress must be seen primarily in relation to subcortical processes. This hypothesis is supported by the similarity of general activity under stress to that of decorticate animals" (37 refs.).

Fox, H. M., Gifford, S., Murawski, B. J., Rizzo, N. D., Kudarauskas, E. N.: "Some methods of observing humans under stress." *Psychiatr. Res. Rep. APA* **7**: 14-26 (1957). J11,149/57

Review on the G.A.S. with special reference to behavioral changes in man. Among the leading psychologic defenses against stress are various forms of narcissism, submission (to a higher power such as God, "fate" or doctors) and activity. On the other hand, some patients respond with masochistic attempts at self-punishment or a hysterical kind of depersonalization and unreality to protect themselves against frightening fantasies about impending operations or other sources of psychogenic stress.

Coleman, J. C.: *Personality Dynamics and Effective Behavior*, p. 566. Chicago: Scott, Foresman, 1956. C92,253/30

A monograph on human behavior with several sections on the psychologic effects of stress and the stressor actions of anxiety. An annotated bibliography deals with such problems as the stress of college life, marriage and the family, and aging.

Mandler, G., Mandler, J., Kremen, I., Sholiton, R. D.: "The response to threat: relations among verbal and physiological indices." *Psychol. Monogr.* **75** (1961). J13,071/61

Nikolov, N. A.: "The effect of the stress reaction on higher nervous activity." *Biull. Èksp. Biol. Med.* **54** No. 10: 63-66 (1962) (Russian). Engl. trans.: *Bull. Exp. Biol. Med.* **54**: 1121-1123 (1962). J25,031/62

In dogs in which stress was produced by formalin injection into a paw, nervous responses were studied during the various phases of the G.A.S. "The excitatory process in the brain cortex suffers more than in subcortical nervous formations. This is explained

by the greater resistance of the latter to strong stimuli formed during the phylogensis."

Ruff, G. E.: "Psychological and psychophysiological indices of stress." In: Burns, N. M., Chambers, R. M. et al., *Unusual Environments and Human Behavior*, pp. 33-59. Glencoe, Ill.: Free Press, 1963. E10,425/63

Brief review on psychologic indices of stress, with special reference to performance.

H96,158/74

Psychoanalytic study of the possibly beneficial mental effects of the "syndrome of just being sick" (21 refs.).

Performance. Perhaps the least well-defined neuropsychiatric parameter of stress is "performance in general," since this is an all-inclusive concept which depends upon and influences virtually all activities.

However, one generalization appears to be justifiable, namely, that a certain degree of stress is necessary to provide the alertness required by all kinds of performance, whereas fatigue and the exhaustion produced by intense or continued severe stress result in a decline in the ability to perform any task.

Research in this field has been especially handicapped by the difficulty of making any generalizations on the basis of objective tests which measure performance in general. However, on the basis of more or less subjective indicators, a good deal of information has been accumulated in relation to the effect of stress upon individual skills, social attainment and recently, on the multiple duties of astronauts working under conditions of acceleration, deceleration and a weightless environment.

Performance (See also Stress Tests). Bills, A. G.: *The Psychology of Efficiency. A Discussion of the Hygiene of Mental Work*, p. 361. New York and London: Harper & Brothers, 1943.

E10,657/43

Monograph on the psychologic factors involved in efficient performance and fatigue, which presents many data useful in the interpretation of stress effects but does not analyze their somatic basis (only key refs.).

Martens, R., Landers, D. M.: "Motor performance under stress: a test of the inverted-U hypothesis." *J. Pers. Soc. Psychol.* **16**: 29-37 (1970). J12,679/70

High school boys were exposed to various

intensities of anxiety by the threat of punishment with electroshock if they performed standard motor tasks poorly. Heart rate, palmar sweat and questionnaire responses served as indicators of stress, and the Children's Manifest Anxiety Scale was used to appraise anxiety. "Results supported the inverted-U hypothesis for the stress factor and the anxiety factor separately." The inverted-U hypothesis states that increases in arousal are associated with improvements in the quality of performance up to a certain point, after which additional increases in arousal impair performance.

H91,958/73

Studies using the TMAS to examine performance in verbal discriminating tasks.

Learning, Cognition and Memory. The effect of stress upon learning and memory has been examined in both experimental animals and in man; yet here again few generalizations can be made.

In rats, hypophysectomy interferes with the acquisition of avoidance responses, and this defect can allegedly be corrected by ACTH.

In man, any severe stress impairs learning ability, but at least according to one study, when subjects are exposed to stress while under the influence of nitrous oxide, the effect of stress on subsequent learning is abolished.

Undoubtedly, stress—particularly that of psychogenic origin—tends to impair memory in a manner very similar to that of aging. An oft-quoted example of this effect is the case of a high executive who consulted a psychoanalyst because of the gradual deterioration of his memory, which he ascribed to "management stress," and who, when asked for an illustration, replied "of what?"

Learning, Cognition and Memory. Keenan, J. W., Deese, J., Lazarus, R. S.: "Anxiety-reduction and stress in verbal learning" (abstracted). *Am. Psychol.* 7: 277-278 (1952). J13,016/52

Singer, H. A.: "The management of stress." *Adv. Management* **25**: 11-13 (1960).

J14,314/60

Stress predisposes to various diseases and reduces efficiency by causing mental blocks. One "executive" claimed that he kept forgetting things after he said them. When the analyst asked him for an illustration he replied: 'Of what?'

Zaidi, S. M. H.: "Reactions to stress as a function of the level of intelligence." *Genet. Psychol. Monogr.* **62**: 41-104 (1960).

J23,535/60

An extensive review of the literature and personal observations led to the conclusion that "there is no evidence for a significant or systematic relation between the level of intelligence and reactions to stress. There is only partial evidence for the prediction that the effect of stress on subsequent learning increases directly with the level of intelligence. There also is only slight evidence that stress interfered with the transfer of training from one learning task to another. However, there is a significant difference between poststress learning when exposure to stress is preceded by learning and when it is not. The latter shows relatively greater effect of exposure to the insoluble task on subsequent learning of the subjects" (80 refs.).

J23,534/75

Emotions (Aggression, Frustration, Fear). Among the emotional disturbances induced by stress, the most common appear to be aggressiveness, a sense of frustration, and fear, particularly loose anxiety, a condition in which the patient is afraid without knowing precisely of what.

Frustration as a consequence of stress is mainly due to a loss of goal orientation and the feeling that nothing is worthwhile—which may gradually progress to severe depression. Aggressiveness may result in the development of special hates (especially among different racial, religious or political groups) or in general irritability and intolerance.

In male mice, isolation causes aggressiveness, which allegedly is reduced by adrenalectomy or ACTH but enhanced by glucocorticoids.

In any event, it is well to realize that severe emotional disturbances during stress are due to changes in the metabolism of certain neurohormonal factors whose elucidation may offer clues to pharmacotherapy when counseling fails.

In man, continuous infusions of EP produce moderate anxiety and its acknowledged somatic manifestations. It is hardly necessary to mention the well-known emotional changes induced by excessive treatment with glucocorticoids.

Emotions (Aggression, Frustration, Fear). Maier, N. R. F.: *Frustration: The Study of Behavior Without a Goal*. New York: McGraw-Hill, 1949. J13,881/49

General discussion of frustration as a manifestation of the stress caused by loss of goal orientation.

Scott, J. P.: *Aggression*, p. 149. Chicago: University of Chicago Press, 1958.

C60,444/58

Popularized description of the factors regulating aggressive behavior, with only cursory reference to the G.A.S.

Hawkins, D. R., Monroe, J. T., Sandifer, M. G., Vernon, C. R.: "Psychological and physiological responses to continuous epinephrine infusion. An approach to the study of the affect, anxiety." *Psychiatr. Res. Rep. APA* 12: 40-52 (1960). J11,148/60

In man, continuous intravenous infusions of EP produced a moderate anxiety reaction in addition to the well-known somatic effects (sweating, tachycardia, hypertension, skin pallor).

Gunderson, E. K. E.: "Emotional symptoms in extremely isolated groups." *Arch. Gen. Psychiatry* 9: 362-368 (1963).

J4,088/63

Observations on scientists and Navy men exposed to prolonged isolation at scientific stations in Antarctica revealed that the most

consistent changes were sleep disturbances, depression and irritability (9 refs.).

Rule, B. G.: "Anti-Semitism, stress, and judgments of strangers." *J. Pers. Soc. Psychol.* 3: 132-134 (1966). D98,287/66

Data indicated that extremely high and extremely low prejudiced individuals react differently under stress than moderately prejudiced individuals. High and low scorers on the Anti-Semitism scale tended to report greater personality differences between two strangers and were more negative in their evaluations of strangers than moderately prejudiced subjects."

Brain, P. F., Nowell, N. W., Wouters, A.: "Some relationships between adrenal function and the effectiveness of a period of isolation in inducing intermale aggression in albino mice." *Physiol. Behav.* 6: 27-29 (1971).

J10,867/71

In male mice, isolation causes aggressiveness (fighting) which is reduced by adrenalectomy or ACTH injection but enhanced by dexamethasone (17 refs.).

Thor, D. H., Ghiselli, W. B., Ward, T. B.: "Infantile handling and sex differences in shock-elicited aggressive responding of hooded rats." *Dev. Psychobiol.* 7: 273-279 (1974).

J12,750/74

Handling during infancy caused only minor changes in the aggressive response of male and female rats exposed to electric footshock in adulthood.

Appetite (including Cravings for Drugs and Alcohol). One of the earliest observations that led to the formulation of the stress concept was the finding that disease of any kind, hemorrhage, surgical trauma or even severe emotional arousal causes a loss of appetite. On the other hand, it has been equally well established that minor psychogenic stress (interpersonal difficulties, the need to abandon smoking and so on) frequently induces an increase in appetite and consequently an excessive gain in body weight. Also, it is common knowledge that certain individuals may be "driven to drink" or become subject to various toxicomanias as a result of stressful life situations or constant pain, but it remains to be seen whether these are truly nonspecific stress effects which could develop upon exposure to any stressor. In any event, the intensity and direction (increase or decrease) of changes in appetite and special cravings are highly subject to individual conditioning factors and represent typical examples of pluricausal responses to stress.

Appetite (including cravings for drugs and alcohol). Thomas, C. B., Ross, D. C.: "Observations on some possible precursors of essential hypertension and coronary artery disease. VIII. Relationship of cholesterol level to certain habit patterns under stress." *Bull. Johns Hopkins Hosp.* **113**: 225-238 (1963). E29,405/63

Among medical students, "subjects in the lower cholesterol group more often reported loss of appetite, exhaustion, nausea and anxiety when under [psychogenic] stress; in addition, urge to be alone, tremulousness and depression were more frequent than expected, although these items only approached significance. The only item with a significant positive relationship to higher cholesterol levels was the urge to eat" (35 refs.).

Pudel, V.: "Experimentelle Untersuchungen über das menschliche Appetitverhalten unter Stress" (Studies on appetite changes in men under stress). *Z. Psychosom. Med. Psychoanal.* **17**: 347-355 (1971). G87,356/71

Anecdotal description of the effects of various stressors upon appetite. The reason why certain stressors can increase or decrease appetite remains unknown.

Pudel, V., Meyer, J.-E.: "Die Fettsucht als Störung des Appetitverhaltens. I. Experimentelle Untersuchungen der Appetit- und Sättigungsregulation" (Obesity caused by changes in appetite. I. Experiments on the regulation of appetite and satiation). *Dtsch. Med. Wochenschr.* **99**: 618-628 (1974). H86,345/74

Review of the literature and numerous personal observations indicating that, depen-

ding upon conditions, stress can produce either a loss or an increase of appetite in different people (22 refs.).

Meyer, J.-E., Pudel, V.: "Die Fettsucht als Störung des Appetitverhaltens. II. Psychosoziale und psychodynamische Aspekte

der Fettsucht" (Obesity caused by changes in appetite. II. Psychosocial and psychodynamic aspects of obesity). *Dtsch. Med. Wochenschr.* **99**: 648-651 (1974).

H86,347/74

Observations on stress-induced hyperphagia in man (17 refs.).

Accident Proneness. There can be little doubt that stress predisposes to accidents in that it interferes with the ability to concentrate and perform various tasks. Several review articles have been devoted to this extremely important problem which affects safety, especially in industry, driving, flying, and other potentially dangerous occupations. Naturally, here again, individual conditioning factors determine the likelihood of a person becoming accident prone during stress.

Accident Proneness. McLean, A. A.: "Accident proneness. A clinical approach to injury-liability." *Ind. Med. Surg.* **24**: 122-126 (1955).

J25,161/55

F67,942/66

Stress and especially depression are often associated with accident proneness.

Brenner, B., Selzer, M. L.: "Risk of causing a fatal accident associated with alcoholism, psychopathology, and stress: further analysis of previous data." *Behav. Sci.* **14**: 490-495 (1969).

J22,571/69

EEG. Depending upon conditions, the EEG changes produced by stress may differ, but in general they are characterized by a decrease in the amplitude of "specific activities."

In normal people, the stress of decision-making has a readily detectable effect upon the EEG. Pertinent studies suggest that sensory signals reach the frontal cortex by a process of "idiodromic projection" to establish a "dispersive convergence." However, the arousal level as indicated by EEG records is not determined solely by any one factor, but represents the combination of several stimuli of varying degrees of specificity.

EEG (See also EEG under Stress Tests). Ulett, G. A., Gleser, G.: "The effect of experimental stress upon the photically activated EEG." *Science* **115**: 678-682 (1952).

genic hypertension (evaluation with Fourier analysis)." *Activ. Nerv. Sup. (Praha)* **7**: 19-24 (1965).

J23,488/65

In rats, hypertension was produced by combined sound, light and electric stimulation, and the associated EEG changes were registered.

Servít, Z., Machek, J., Strejčková, A., Fischer, J.: "Comparative pathophysiology of the paroxysmal EEG. Laminar analysis of the electrogenesis of spike and wave activity in the frog telencephalon." *Physiol. Bohemoslov.* **15**: 327-336 (1966).

J22,664/66

Studies on frogs stressed by electroshock led the authors to the conclusion that "the electrographic spike of the spike and wave complex is generated by successive depolarisation of the paleopallial cortex from the sur-

face into the depth (type I) or from the depth towards the surface (type II). The first type apparently arises by propagation of the paroxysm along afferent pathways from other brain structures, the second type by paroxysmal discharge of the granular layer of the pallium effected directly by the electrical stimulus. The slow wave of the complex is accompanied by protracted negativity in the molecular (dendritic) layer."

Studies on healthy young men kept in a water bath of varying temperature "suggested that the arousal level as indicated by both the subjective and EEG records is not determined solely by either the body temperature or ambient conditions but is a resultant of their combined influences."

Sudakov, K. V.: "Emotional stress and its manifestation in dynamic of electroencephalographical and somatovegetative reactions." *Proc. Satellite Symp. Emotions and Visceral Functions*, pp. 49-53. Baku, USSR, 1974. (Russian, with extensive English summary). J17,536/74

Varia. The importance of *genetic* factors in the development of neuropsychologic disturbances during stress has been amply illustrated. We have seen that certain strains of wild rabbits develop a "stress thyrotoxicosis" when threatened by a dog or man. Similarly, audiogenic convulsions ascribed to the stressor effect of intense sound develop only in genetically hypersensitive individuals, for example, in certain strains of mice and rats. As we shall see in the section on Diseases of Adaptation, even epileptic convulsions may be precipitated by stress in predisposed people.

Women who do not readily adapt to *odors* (measured by an olfactometer) have the greatest incidence of stressful life events.

ACTH raises the *muscle action potential* after stimulation of the gastrocnemius in the rat, while hypophysectomy has an opposite effect.

In his Nobel lecture on *Ethology and Stress Diseases*, Tinbergen reported data in support of the concept that *autism* in children is usually the result of environmental stress.

Varia (See also Diseases of Adaptation).
 Kracht, J., Kracht, U.: "Zur Histopathologie und Therapie der Schreckthyreotoxikose des Wildkaninchens" (The histopathology and therapy of fright thyrotoxicosis in wild rabbits). *Virchows Arch. [Pathol. Anat.]* **321**: 238-274 (1952). B68,863/52

In some strains of wild rabbits, fear induced by a pursuing dog or man causes "*stress thyrotoxicosis*" with histologic signs of thyroid hyperactivity and exophthalmos.

Bevan, W.: "Sound-precipitated convulsions: 1947 to 1954." *Psychol. Bull.* **52**: 473-504 (1955). D78,855/55

Review of genetic and stress factors causing *audiogenic convulsions*. It is deplored that "despite general preference for a physiological model, nothing has been done to assay systematically physiological differences among susceptible and nonsusceptible animals. Although electroshock convulsions have been discussed within the framework of Selye's adaptation syndrome hypothesis, and although audiogenic seizures have been regarded as a stress phenomenon by both physiologically and psychologically biased investigators, no vigorous attempt to exploit Selye's logic has been made for the latter phenomenon" (145 refs.).

Hart, F. M., King, J. A.: "Distress vocalizations of young in two subspecies of *Peromyscus maniculatus*." *J. Mammal.* **47**: 287-293 (1966). J25,104/66

Hecker, M. H. L., Stevens, K. N., Bismarck, G. von, Williams, C. E.: "Manifestations of task-induced stress in the acoustic speech signal." *J. Acoust. Soc. Am.* **44**: 993-1001 (1968). J25,047/68

Schneider, R. A., Costiloe, J. P.: "Limitation of olfactory adaptation in subjects under stress" (abstracted). *Fed. Proc.* **28**: 829 (1969). H10,717/69

In women who kept a diary of their daily life events, *olfactory thresholds* were measured repeatedly with a recording olfacto-

meter. "Those subjects who did not adapt or rarely adapted to the odor had the greatest incidence of stress recorded in their diary on the test days."

Horowitz, M. J., Becker, S. S., Moskowitz, M., Rashid, K.: "Intrusive thinking in psychiatric patients after stress." *Psychol. Rep.* **31**: 235-238 (1972). J20,571/72

After viewing stressful films, both psychiatric patients and normal individuals had increased *intrusive and repetitive thoughts*.

Horowitz, M. J., Becker, S. S.: "Cognitive response to stress: experimental studies of a 'compulsion to repeat trauma.'" In: Holt, R. R. and Peterfreund, E., *Psychoanalysis and Contemporary Science*, Vol. 1, pp. 258-305. New York: Macmillan, 1972.

G89,099/72

Observations strongly supporting "the hypothesis of a tendency toward *intrusive repetitive thought* after mild or moderate, as well as major, stresses in persons without psychiatric illness."

Reeves, R. B. Jr.: "What happens to the patient's religion?" *Delaware Med. J.* **45**: 40-43 (1973). J19,880/73

A pastor describes his experience in the change of the *religious feelings* of patients in hospitals. "We are dismayed by our own humanity, unable to accept our creatureliness as proper to our being, unable to love ourselves. This, of all the stresses a patient may suffer, can be the most disturbing."

Warburton, D. M.: "Modern biochemical concepts of anxiety. Implications for psychopharmacological treatment." *Int. Pharmacopsychiatry* **9**: 189-205 (1974).

J21,388/74

In man, "corticosteroids produce agitation and enhance *anxiety*. It is proposed that anxiety results from the neurochemical changes induced by corticosteroids. Evidence was presented to show that the critical changes for anxiety are due to modifications in serotonin pathways in the tegmental region of the midbrain."

Schmidt, R. T.: "Personality and fainting." *J. Psychosom. Res.* 19: 21-25 (1975).

J22,160/75

Vasodepressor *fainting* often occurs in response to stressful situations in predisposed individuals. It may be precipitated by "a situation, which elicits little emotional response from most people, [but which] can be extremely unpleasant for the fainter. The

injury threatened may be minimal, but the related psychic stress is great. Chronic fainters learn to anticipate fainting and avoid precipitating stresses." This differs from hysterical fainting, in which pulse and blood pressure remain normal. "A vasodepressor reaction leads to collapse of the circulatory system, which sometimes resembles shock and has been known to result in death."

LIST OF STRESS TESTS

For convenience, the most commonly used stress tests are listed here with their abbreviations:

AAR Adjusted Averaged Evoked Response Questionnaire.

APQ Autonomic Perception Questionnaire.

BPI Berkeley Psychological Inventory.

BUPI Boston University Personality Inventory.

CFF Critical Flicker Fusion.

CMACL Composite Mood Adjective Check List.

CMI Cornell Medical Index.

CST Controlled Stress Test.

EPI Eysenck Personality Inventory.

FPJP Frequency of Perceived Job Pressure.

GSR Galvanic skin resistance (or response, or reflex).

HOS Health Opinion Survey.

HSTT Harrower Stress Tolerance Test.

IES Impulse Expression Scale.

IPAT Anxiety Scale Institute for Personality and Ability Testing Anxiety Scale.

JAS Jenkins Activity Survey.

LCI Life Change Inventory.

LCU Life Change Unit.

LEI Life Events Inventory.

MARS Manifest Affect Rating Scale.

MAS See **TMAS**.

MMPI Minnesota Multiphasic Personality Inventory.

MPI Maudsley Personality Inventory.

RLCQ Recent Life Change Questionnaire.

RMM Running Matching Memory Test.

SEI Subjective Experience Inventory.

SHG Sustained handgrip.

SIRS Seriousness of Illness Rating Scale.

SPL Skin potential level. Cf. also **GSR**.

SPQ Somatic Perception Questionnaire.

SPRS Suicide Potential Rating Scale.

S-R Inventory Stimulus-Response Inventory.

SRE Schedule of Recent Experience.

SRRQ Social Readjustment Rating Questionnaire.

SRRS Social Readjustment Rating Scale.

SSFIPD Social Stress and Functionability Inventory for Psychotic Disorders.

SSS Subjective Stress Scale.

STAI State-Trait Anxiety Inventory.

SVS Stress Value Scale.

TAQ Test Anxiety Questionnaire.

TMAS Taylor Manifest Anxiety Scale.

TPT Halstead Tactual Performance Test. An assessment of 3-trial learning as well as a test of tactual efficiency.

TRI Total Response Index.

WCST Wisconsin Card Sorting Test.

WSSA Worcester Scale of Social Attainment.

Stress Tests

Generalities. One of the greatest difficulties encountered in research is the measurement of stress intensity by accurate objective indices. The reason for this difficulty is that every agent also has specific effects which may selectively affect and alter the response of one or the other target used as an indicator of nonspecific stress.

It is virtually impossible to categorize the diverse Stress Tests because they often overlap; yet we had to arrange them in some order that would permit cognate procedures to be surveyed conjointly. Hence, we shall arbitrarily distinguish the following classes: chemical parameters, hematologic parameters, muscular function, EEG, questionnaires, "stress interviews," exposure to media (especially stressful film or television shows), flicker fusion frequency, culture stress tests, Rorschach test, problem solving, temperature variations, cutaneous conductance and sweating, multifactorial stress tests and adrenocortical function tests (pyrogens, EP, metyrapone). Finally, we shall list a few special instruments designed for the measurement of stress.

Stress Tests

(See also our earlier stress monographs, p. xiii, and *cf.* Blood Cells, Skin, and other Characteristic Manifestations of Stress, including EEG)

Generalities. Miller, J. G.: "The development of experimental stress-sensitive tests for predicting performance in military tasks." *PRB Technic. Res. Rep.* 1079, p. 63. Washington, D.C.: Psychol. Res. Assoc., 1953.

B90,654/53

A detailed report on various "stress tests," with special reference to their applicability in appraising candidates for paratroop training. Among the tests mentioned are: Tachistoscopic Presentation of Broken Circles, Wisconsin Concept Formation test, Level of

Aspiration test, CFF, Digit Symbol and Digit Span subtests from the Wechsler-Belle-
vue Intelligence Scale, tapping, leg-swinging,
word fluency and number subtests from the
SRA Primary Mental Abilities test, ergo-
graph, Myokinetic test, Luria technique,
pneumograph, Sentence Completion test,
Cancellation of C's, Auditory Flutter, trem-
bleometer and the Taylor Anxiety Scale
from the MMPI. "The four most promising
measures were: the CFF (dim intensity);
the trembleometer, Cancellation of C's; and
the Primary Mental Abilities Word Fluency
test." Some comments are made on the test
value of viewing bloody battle movies and
simulated dangerous situations, hearing abu-
sive or derogatory remarks, reliving stressful
combat experiences under sodium amyral,
diving in a submarine training tower, partici-

pating in an infiltration course or simulated battle, jumping from a tower used for training paratroopers and throwing live hand-grenades.

Bridges, P. K.: "Practical aspects of the use of some psychological tests of anxiety in a situation of stress." *Br. J. Psychiatry.* **123**: 587-596 (1973). J8,356/73

In students undergoing the stress of academic oral examinations, respiration rate, heart rate, blood pressure, plasma corticoids, 17-KGS and urine flow were the "physiologic variables" correlated with various psychologic tests, namely: the TMAS, the MMPI, the EPI, the IPAT Anxiety Scale and the S-R Inventory. "The psychological instruments used showed close relationships together, but there were few associations between the overall psychological test results and the physiological responses. The linear analogue scale is

a useful measure of situational anxiety. The other tests used purported to be measures of trait anxiety and should therefore have been relatively stable, but most were found to increase significantly when completed by subjects during states of anxiety."

Silverman, J., Rappaport, M., Hopkins, H. K., Ellman, G., Hubbard, R., Belleza, T., Baldwin, T., Griffin, R., Kling, R.: "Stress, stimulus, intensity control, and the structural integration technique." *Confin. Psychiatr.* **16**: 201-219 (1973). J11,971/73

Review and personal observations on EEG, eye movement and various biochemical tests as indicators of stress.

Pryor, T. A., Ridges, J. D.: "A computer program for stress test data processing." *Comput. Biomed. Res.* **7**: 360-368 (1974). J16,017/74

Chemical Parameters. The various chemical determinations and bioassays of hormones and other compounds characteristic of stress have been discussed in detail under Chemical Changes. Let us merely repeat here that the most common chemical indicators are the plasma and/or urine levels of ACTH, glucocorticoids and catecholamines. In addition, the FFA and cholesterol content of blood rises regularly, and this is frequently used as an objective basis for the assessment of stress situations in experimental animals as well as in man.

Most other chemical indicators, though fairly constant, are less reliable, since they merely show increases or decreases, depending upon conditioning factors which are difficult to control or even identify. Thus, for example, the blood sugar, STH, LTH, insulin, glucagon and vasopressin content may be shown as either an increase or decrease, depending upon the intensity and duration of the stress as well as the body's reactivity. Hence, they are not reliable indicators of stress, although they are definitely subject to modification by it.

Capillary blood oxygen saturation and oxygen uptake by tissues have also been used for the quantification of stress, but they are too dependent upon the specific characteristics of the stressor to be employed except under certain conditions when all other modifying circumstances can be standardized.

Chemical Parameters. Rohdenburg, G. L., Manheims, P. J.: "A clinical laboratory procedure for the study of the General Adaptation Syndrome." *J. Clin. Endocrinol. Metab.* **12**: 1031-1039 (1952). B72,657/52

A turbidity test "applicable to blood and urine, which renders it possible to evaluate the General Adaptation Syndrome of Selye, is reported. A series of cases is presented illustrating the clinical application of the procedure."

Tayeau, F., Neuzil, E., Nivet, R., Grouillé,

J.: "Le phénomène d'obstacle de Donaggio. Recherches physiopathologiques sur l'apparition de la mucoprotéine urinaire" (Obstacle phenomenon of Donaggio; physiopathologic studies on appearance of urinary mucoprotein during alarm reaction). *J. Physiol. (Paris)* **46**: 536-537 (1954). B96,231/54

The so-called obstacle phenomenon of Donaggio is due to an increased excretion of mucoprotein metabolites in the urine and is characteristic of the alarm reaction.

Lovett-Doust, J. W., Schneider, R. A.:

"Studies on the physiology of awareness: an oximetrically monitored controlled stress test." *Can. J. Psychol.* **9**: 67-78 (1955).

C6,045/55

The CST attempts to quantify the emotional aspect of awareness by determining capillary blood-oxygen saturation, which is allegedly related to emotional change in normal subjects but not in psychotics.

Marconi, R., Cravero, D.: "Il test del Tween 80. Un indice della reattività organica al trauma operatorio" (The tween 80 test. An index of organic reactivity to surgical trauma). *Minerva Chir.* **15**: 774-778 (1960). J24,042/60

Some metabolite causing turbidity in human blood when mixed with tween 80 is considered to be indicative of stress.

Back, K. W., Bogdonoff, M. D.: "Plasma lipid responses to leadership, conformity, and deviation." In: Leiderman, P. H. and Shapiro, D., *Psychobiological Approaches to Social Behavior*, pp. 24-42. Stanford, Cal.: Stanford University Press, 1964.

J11,130/64

Detailed review of plasma FFA as an objective indicator of stress in man, particularly in social relations. Plasma FFA are very sensitive to changes in autonomic nervous activity, and are especially useful in assessing situational demands and group interactions.

Fessel, W. J.: "Dextran turbidity: acute distress-phase reaction." *Nature* **205**: 771-773 (1965). F32,709/65

Among patients treated for various types of psychogenic stress, heavy turbidity in the plasma occurs after additional dextran ther-

apy. This response can also be induced experimentally by exposing the subjects to stressful mental experiences. "The presence of so much fibrinogen in the precipitate suggests the possibility that the increased levels of dextran turbidity in mental disease and emotional stress result from activation of various serum enzyme systems which cause changes in the internal structure of blood proteins. Plasmin, which affects the fibrinogen molecule, is activated by various agents including emotional stress, physical stress, adrenal steroids, adrenaline, acetylcholine and histamine, and some evidence suggests that plasmin may be under reflex control. Other serum enzymes are also activated by stress, which is known to influence a variety of blood proteins" (20 refs.).

Auchincloss, J. H. Jr., Gilbert, R.: "Estimation of maximum oxygen uptake with a brief progressive stress test." *J. Appl. Physiol.* **34**: 525-526 (1973). H79,368/73

An exercise test in which measurements of oxygen uptake aided in evaluation of cardiac patients is referred to as a "stress test," although there is no proof or even probability of any relationship between the specific effect of muscular work upon oxygen utilization and the nonspecific response to stress as commonly defined.

Combs, D. T., Martin, C. M.: "Evaluation of isoproterenol as a method of stress testing." *Am. Heart J.* **87**: 711-715 (1974). H86,844/74

Description of the advantages of the ECG responses to isoproterenol for the evaluation of myocardial efficiency, as compared to coronary arteriography or the treadmill test.

Hematologic Parameters. Among the hematologic changes characteristic of stress, eosinopenia, lymphopenia, polymorphonuclear leukocytosis and the appearance of "stress lymphocytes" have been described in the section on Morphologic Changes. Of all these, eosinopenia proved to be the most reliable, especially in clinical medicine.

Hematologic Parameters. Laragh, J. H., Almy, T. P.: "Changes in circulating eosinophils in man following epinephrine, insulin, and surgical operations." *Proc. Soc. Exp. Biol. Med.* **69**: 499-501 (1948).

B31,814/48

Surgical trauma and injections of EP or insulin caused eosinopenia in man.

Hills, A. G., Forsham, P. H., Finch, C. A.: "Changes in circulating leukocytes induced

by the administration of pituitary adrenocorticotropic hormone (ACTH) in man." *Blood* **3**: 755-768 (1948). B33,083/48

In man, ACTH causes pronounced lymphopenia and eosinopenia with a moderate polymorphonuclear leukocytosis. The comparable blood count changes of the alarm reaction are ascribed to endogenous ACTH secretion.

Thorn, G. W., Forsham, P. H., Prunty, F. T. G., Hills, A. G.: "A test for adrenal

cortical insufficiency." *J.A.M.A.* **137**: 1005-1009 (1948). D98,669/48

Eosinopenia and a rise in uric acid excretion consistently follow ACTH injection in man, and may be used as a test of adrenocortical activity.

Recant, L., Hume, D. M., Forsham, P. H., Thorn, G. W.: "Studies on the effect of epinephrine on the pituitary-adrenocortical system." *J. Clin. Endocrinol.* **10**: 187-229 (1950). B47,003/50

"A simple clinical test for the evaluation of pituitary-adrenocortical integrity is presented, based on the four-hour fall in circulating eosinophils following the subcutaneous injection of 0.3 mg. of epinephrine or the intravenous administration of 0.2 mg. in 200 cc. of saline over a one-hour period. A fall exceeding 50 per cent excludes both adrenocortical and pituitary ACTH deficiency."

Fisher, B., Fisher, E. R.: "Observations on the eosinophil count in man. A proposed test

of adrenal cortical function." *Am. J. Med. Sci.* **221**: 121-132 (1951). B63,230/51

Renold, A. E., Quigley, T. B., Kennard, H. E., Thorn, G. W.: "Reaction of the adrenal cortex to physical and emotional stress in college oarsmen." *N. Engl. J. Med.* **244**: 754-757 (1951). B65,108/51

Observations on the Harvard-Yale boat race crews showed a marked eosinopenia, interpreted as a sign of stress-induced corticoid secretion. However, muscular effort was not the only stressor, since the coxswain also responded with pronounced eosinopenia although he was almost exclusively under emotional stress.

Wheeler, W. M., Little, K., Dorcus, R. M., Clemens, T. L., Sternberg, T. H., Zimmerman, M. C.: "The effects of psychological stress as measured by a decrease in the number of circulating eosinophiles." *J. Clin. Exp. Hypnos.* **2**: 130-135 (1954). J22,382/54

In patients, eosinopenia is produced by actual and by hypnotically-suggested anxiety.

Muscular Function. Stress tests based on muscular function are of two kinds: those that measure muscular tone and those that determine resistance to muscular exercise. In general, stressors increase muscular tension and hence the EMG, particularly in psychoneurotic and psychotic patients. Pain, often localized to the neck and shoulder muscles, is also characteristic of stress but hardly suitable for use as an objective quantitative indicator. The same can be said of hyperkinesia (the urge to walk up and down, contraction of the jaw muscles or table drumming with the fingers). Besides, these changes are usually elicited only by emotional stressors and are not truly non-specific.

Exercise (for example, on a bicycle ergometer or treadmill as well as "step-stress tests") with measurements of cardiovascular function (ECG, blood pressure, pulse rate, provocation of anginal attacks) is often referred to as a "stress test" although it is virtually a specific means of determining the functional capacity of the heart and vessels.

Muscular Function (See also Muscular System). Pinneo, L. R.: "The effects of induced muscle tension during tracking on level of activation and on performance." *J. Exp. Psychol.* **62**: 523-531 (1961).

D84,799/61

Call, R. W., Clyman, B., Kaserman, D. R.: "Practical use of stress testing in industry." *J. Occup. Med.* **10**: 649-659 (1968).

J10,261/68

A radiotelemetry exercise test was applied to industrial management personnel to appraise their stress resistance by detecting unsuspected coronary artery disease (33 refs.).

Cureton, T. K.: "The relative value of stress indicators, related to prediction of strenuous athletic (treadmill) performance: a review." *Am. Correct. Ther. J.* **23**: 59-62 (1969). J23,436/69

Borg, G.: "Perceived exertion as an indicator of somatic stress." *Scand. J. Rehab. Med.* **2**: 92-98 (1970). J20,213/70

Description of a new "work test" and "walktest" for the measurement of physical fitness.

Knowlton, R. G., Sutton, A. I.: "The predictive significance of ballistocardiographic

dynamics to determine submaximal exercise stress." *Am. Correct. Ther.* **25**: 84-88 (1971). J20,534/71

Snyder, C. R.: "Amount of body movement as an indicant of task-irrelevant test anxious responses." *J. Psychol.* **80**: 147-150 (1972). J20,336/72

In general, task-irrelevant movements are characteristic of stress, but in one particular "classroom-type learning situation" this was not so. A possible reason for this finding may be that the nature of the task-irrelevant response occurs principally at the internal cognitive level rather than at the overt physical level."

Testing industrial personnel by ECG changes during exercise on an ascending treadmill is highly recommended because CHD, "the major health concern to industry, may be undetectable in large numbers of people through routine clinical evaluation. Within an industrial setting the prompt diagnosis of such individuals is crucial not only for safe employability, but also for the institution of vigorous preventive measures" (17 refs.).

Ellestad, M. H., Wan, M. K. C.: "Predictive implications of stress testing. Follow-up of 2700 subjects after maximum treadmill stress testing." *Circulation* **51**: 363-369 (1975). J22,240/75

Among twenty-seven hundred subjects exposed to severe treadmill tests, in those who reacted with characteristic ST-segment depression, subsequent coronary infarcts were much more common than in others.

EEG. Several investigators have described EEG changes, especially blockade of the alpha rhythm, with various stressors in animals and man, but none of these can be regarded as truly nonspecific. At best, the EEG may serve as an indicator of arousal during psychogenic stress.

EEG (See also EEG under Nervous System). Roth, M., Osselton, J. W., Givens, J. G.: "Some common features of the EEG changes associated with severe metabolic and other stress and their bearing on the problem of homeostasis." *Electroencephalogr. Clin. Neurophysiol.* Supp. 25: 276-281 (1967). G59,751/67

The EEG changes produced in man by various stressors have many features in common and may reflect nervous activity important for homeostasis.

J11,971/73

Review and personal observations on EEG, eye movement and various biochemical tests as indicators of stress.

ECG. The ECG is considerably altered by both emotional and physical stress conditions. Several instruments have been devised to determine ECG changes, often in combination with other indices such as blood pressure variations, by telemetry while patients are exercising on a treadmill. For the interpretation of various stress-induced ECG changes, the reader is referred to the original publications in the corresponding abstract section.

ECG responses to isoproterenol have been recommended for the evaluation of myocardial efficiency in preference to arteriography or the treadmill test; however, the claims behind this recommendation require confirmation.

Questionnaires. Replies to standardized questions are most commonly used to determine a person's subjective appraisal of psychogenic stress elicited by various stimuli and everyday life events. Some of the most popular among these are the: MMPI, WSSA, TMAS, BPI, IES, APQ, SEI, SRE, SRRQ, JAS (which distinguishes coronary-prone or Type A behavior), FPJP (based on certain indices—frustration, pressure, upset, jumpy nerves, tension, stress and strain), CMACL (which evaluates stress in ATCs by their subjective assessment of a standard list of feelings), MPI, EPI, and the Los Angeles Heart Study's SSS.

Currently, perhaps the most frequently used stress questionnaire is Holmes' and Rahe's SRRQ, which enumerates forty-three life events that the subject must rate with regard to the demand they place upon him for readjustment in his life. This, like all other such questionnaires, reflects only psychogenic stress but it has the advantage of including both eustress and distress. Its great disadvantage is that the meaning of a life event listed in the questionnaire—for example, divorce, marriage or a mortgage of less than \$10,000—depends much more on the individual who experiences it than on the event itself. For example, divorce may be pleasant, indifferent, or catastrophic, depending upon the relationship of the spouses, and a mortgage of less than \$10,000 may be a relief to a person who gradually worked it down from \$100,000 or a tragedy to someone who believes he could never collect that much money. It is true that in statistically analyzed large groups of patients, the ratings coincided with the onset of what we may regard as diseases of adaptation or of stress, but this may be partly due to psychologic factors in stress-prone individuals who are most likely to attribute high subjective ratings to virtually any event. If this is correct, the nature of the items selected is of little consequence as long as they are sufficiently common and meaningful in a given social class to serve for the assessment of the emotionality of its members. Nevertheless, a list of this kind has its justification as long as we understand its limitations and do not extend its evaluation to stress resistance beyond that of emotional arousal.

Questionnaires. Haggard, E. A.: "Experimental studies in affective processes: I. Some effects of cognitive structure and active participation on certain autonomic reactions dur-

ing and following experimentally induced stress." *J. Exp. Psychol.* **33**: 257-284 (1943). B33,896/43

Experiments on man using a test consisting

of three time periods. "I, the conditioning or stressful session, during which the S's were asked to give chained associations to each of 42 stimulus words. They were always (and only) shocked between 10 and 12 sec. after the stimulus word *sword*, which recurred five times during the list; II, the therapy session, in which one of three experimental procedures was employed to alleviate the general disturbance and extinguish the specific reactions initiated during the first session; and finally, III, a test period to measure the relative effectiveness of the therapies." A strong electric shock was used as the stressor and GSR as the principal indicator of autonomic activity. "In general, those individuals who knew most about the conditions involved in the situation and who took an active attitude or role in facing this experience consistently showed less disturbance on all measures of autonomic reactivity during the stressful and therapy sessions" (87 refs.).

sponse to stress: a theoretical analysis and an experiment." *J. Pers. Soc. Psychol.* **6**: 291-303 (1967).

J8,942/67

An effort to find connections between personality and individual differences in response to stressors. "A 795-item personality inventory revealed 131 discriminating items in an ipsative (intraindividual) design. Ss who responded relatively more strongly to a threatening motion picture film than to threat of electric shock described themselves as lacking in impulse expression, socially inhibited, introverted, submissive, suggestible or obedient, insecure, passive, anxious and not caring about friends. Ss who responded more strongly to threat of shock than to the movie attributed the opposite qualities to themselves. Normative (interindividual) analyses (high response to film compared to low response to film, high response to shock compared to low response to shock) found no more discriminating personality items than would be expected by chance." The questionnaire included five hundred items of the BPI, MMPI, IES, APQ, SEI and other miscellaneous tests.

J13,891/67

Description of the SRE, a self-administered questionnaire based on the total LCU scores of Rahe and Holmes. It indicates what life events are salient to the subject and hence are likely to cause stress.

Masuda, M., Holmes, T. H.: "The Social Readjustment Rating Scale: a cross-cultural study of Japanese and Americans." *J. Psychosom. Res.* **11**: 227-237 (1967).

J13,504/67

Description of the SRRQ designed to quantify the amount of change in life adjustment required by forty-three categories of life events. Some of these are socially desirable, others undesirable, but "each usually evokes or is associated with some adaptive or coping behavior on the part of the involved individual. The emphasis is on change from the existing steady state, and not on psychological meaning, emotion, or social desirability." Similarities and differences between American and Japanese population samples are discussed (22 refs.).

Holmes, T. H., Rahe, R. H.: "The Social Readjustment Rating Scale." *J. Psychosom. Res.* **11**: 213-218 (1967).

J11,293/67

Description of the SRRQ, which serves as

a basis for the SRRS. The questionnaire contains forty-three life events which the subject must rate with regard to the demand for readjustment in his life, regardless of the pleasantness or unpleasantness of the situation. As expected, there were great individual variations in the significance of, and emotions raised by, a given event. In five thousand patients the ratings given to the events that coincided with disease onset were collated in the Social Readjustment Rating Scale (see p. 677).

These and similar investigations suggest a "relationship of what has been called 'life stress,' 'emotional stress,' 'object loss,' etc." The greater the magnitude of life change (or crisis) the greater the probability that it will be associated with disease onset as a consequence of stress involved in meeting demands for readaptation. [Although the questionnaires on which this scale is based very correctly avoided distinguishing between desirability of events (that is, between eustress and distress), application of the mean scores to any individual is handicapped by the fact that the degree of adaptive effort to meet the situation is subject to great variations. These had to be disregarded, since they are impossible to quantify (H.S.).]

Rahe, R. H.: "Life-change measurement as a predictor of illness." *Proc. R. Soc. Med.* **61**: 1124-1126 (1968).

H65,680/68

Brief description of the SRE questionnaire of Rahe and Holmes. "By the completion of this instrument a subject may indicate which of the several life changes listed in the questionnaire have happened to him, and how often, over the past few years. These life changes cover a broad spectrum of social interaction ranging from matters of occupation, residence, community, family and marriage, to matters of religion, personal habits and health. Previous studies have indicated that the more these separate life changes accumulate in a subject's life over a year's time the greater becomes the likelihood that he will experience a major illness within the following year."

Rahe, R. H.: "Multi-cultural correlations of life change scaling: America, Japan, Denmark, and Sweden." *J. Psychosom. Res.* **13**: 191-195 (1969).

J13,505/69

Social stress among inhabitants of various countries was compared using the SRRQ. "Despite many cross-cultural differences, similarities between twentieth century cultures are far more pronounced" (15 refs.).

SOCIAL READJUSTMENT RATING SCALE

Rank	Life event	Mean value
1	Death of spouse	100
2	Divorce	73
3	Marital separation	65
4	Jail term	63
5	Death of close family member	63
6	Personal injury or illness	53
7	Marriage	50
8	Fired at work	47
9	Marital reconciliation	45
10	Retirement	45
11	Change in health of family member	44
12	Pregnancy	40
13	Sex difficulties	39
14	Gain of new family member	39
15	Business readjustment	39
16	Change in financial state	38
17	Death of close friend	37
18	Change to different line of work	36
19	Change in number of arguments with spouse	35
20	Mortgage over \$10,000	31
21	Foreclosure of mortgage or loan	30
22	Change in responsibilities at work	29
23	Son or daughter leaving home	29
24	Trouble with in-laws	29
25	Outstanding personal achievement	28
26	Wife begin or stop work	26
27	Begin or end school	26
28	Change in living conditions	25
29	Revision of personal habits	24
30	Trouble with boss	23
31	Change in work hours or conditions	20
32	Change in residence	20
33	Change in schools	20
34	Change in recreation	19
35	Change in church activities	19
36	Change in social activities	18
37	Mortgage or loan less than \$10,000	17
38	Change in sleeping habits	16
39	Change in number of family get-togethers	15
40	Change in eating habits	15
41	Vacation	13
42	Christmas	12
43	Minor violations of the law	11

Reproduced, by permission, from T. H. Holmes and R. H. Rahe, *J. Psychosom. Res.* 11: 216 (1967).

Zyzanski, S. J., Jenkins, C. D.: "Basic dimensions within the coronary-prone behavior pattern." *J. Chron. Dis.* 22: 781-795 (1970).

J8,980/70

The self-administered JAS identifies men with a coronary-prone behavior pattern (Type A) with about 70 percent accuracy.

Actually, this behavior pattern is composed of at least three independent behavioral syndromes: (1) Hard-Driving Temperament, (2) Job Involvement, (3) Speed and Impatience. "A system was constructed for deriving factor scores for individuals on these dimensions, and these scores were demon-

strated to be reliable across forms of the test and stable over time. The 3 scores were uncorrelated with each other."

Rahe, R. H., Mahan, J. L. Jr., Arthur, R. J.: "Prediction of near-future health change from subjects' preceding life changes." *J. Psychosom. Res.* **14**: 401-406 (1970).
J14,839/70

On the basis of the LCU questionnaire, it was possible to predict subsequent illness frequency among U.S. naval personnel on three combat cruises, thus confirming many earlier retrospective studies which documented the association between a subject's life stress and illness rate. "The finding, then, that the life change and subsequent illness hypothesis held up in the prospective test is perhaps more impressive when it is realized these experiments dealt with a very restricted portion of the spectrum of stress and disease" (23 refs.).

Harmon, D. K., Masuda, M., Holmes, T. H.: "The Social Readjustment Rating Scale: a cross-cultural study of Western Europeans and Americans." *J. Psychosom. Res.* **14**: 391-400 (1970).
J13,507/70

The SRRQ is described in detail. In French translation, it was administered to French, Belgian and Swiss subjects of widely different cultural backgrounds, and in comparison with the scores of Americans, "a high correlation of relative rank ordering of readjustment required by life events was observed ($r_s = 0.89$), but differences in cultures and living conditions were reflected in the SRRS obtained."

G82,945/71

The SRE questionnaire is used to assess recent life changes in personal, family, social, religious, residential, community, economic, occupational and health experience. This test has been modified by including appropriate questions for use on military populations.

Wyler, A. R., Masuda, M., Holmes, T. H.: "Magnitude of life events and seriousness of illness." *Psychosom. Med.* **33**: 115-122 (1971).
J11,297/71

The SRE, the SRSS and the SIRS are briefly discussed and the pertinent literature quoted. Mainly on the basis of the SRE, "a significant positive relationship of life events to illness magnitude was found."

Takakuwa, E.: "Maintaining concentration (TAF) as a measure of mental stress." *Ergonomics* 14: 145-157 (1971). J17,215/71

Discussion of a technique for measuring the ability to maintain concentration as an indicator of stress. For reasons not explained in this article, the author refers to it as the "TAF test."

Smith, R. C., Melton, C. E., McKenzie, J. M.: *Affect Adjective Check List Assessment of Mood Variations in Air Traffic Controllers*, p. 8. Washington, D.C.: Department of Transportation, Federal Aviation Administration, 1971. G86,726/71

Description of the CMACL, which evaluates stress in ATCs by their subjective assessment of eighty adjectives (including aggression, anxiety, concentration, depression, distrust, dizziness, fatigue and so on). Night shifts prove to be especially fatiguing.

Thurlow, H. J.: "Illness in relation to life situation and sick-role tendency." *J. Psychosom. Res.* 15: 73-88 (1971). J14,015/71

Life stress, determined by the SRE of Rahe and Holmes in 165 industrial employees, showed a definite correlation with "sick-role tendency." However, "the most effective predictor of the number of future illness episodes was the number of past illness episodes and the most effective predictor of future absenteeism was past absenteeism" (23 refs.).

Holmes, T. H., Masuda, M.: "Psychosomatic syndrome: when mothers-in-law or other disasters visit, a person can develop a bad, bad cold. Or worse." *Psychol. Today* April, 1972, pp. 71-72, 106. J13,886/72

Semipopular description of the close relationship between life events (as determined by the questionnaire of Rahe and Holmes) and various maladies, including peptic ulcers, tuberculosis, psychic breakdown, heart disease, nasal infections and even common cold.

Buck, V. E.: *Working Under Pressure*, p. 252. London: Staples Press, 1972.

E10,629/72

Description of the FPJP questionnaire, which is based on seven key indices: frustration, pressure, upset, jumpy-nervousness, tension, stress and strain.

Neufeld, R. W. J., Davidson, P. O.: "Scaling of the Subjective Stress Scale with a sample of university undergraduates." *Psychol. Rep.* 31: 821-822 (1972).

J13,318/72

Hare, E. H., Payne, H., Laurence, K. M., Rawnsley, K.: "Effect of severe stress on the Maudsley Personality Inventory score in normal subjects." *Br. J. Soc. Clin. Psychol.* 11: 353-358 (1972). G97,218/72

In mothers of spina bifida children, the MPI score is considerably influenced by the stress of grief.

Smith, R. C.: "A study of the state-trait anxiety inventory and the assessment of stress under simulated conditions." *Federal Aviation Administration*, Aviation Med. pamphlet, pp. 1-5. Washington, D.C., 1972. G96,466/72

The STAI "produces scores indicating the individual's current level of anxiety, i.e., A-State, and how prone the individual is to experience anxiety, i.e., A-Trait. It is easily administered and scored and, since it contains only 40 items which are to be rated on four-point scales, it takes only a few minutes for the respondent to complete." Its possible use in the study of aviation stress is examined. "It appears that the STAI can be used for measuring the anxiety of air traffic controllers, or workers in other high-demand occupations, with considerable confidence that the validity of findings will not be reduced by the unsuspected effects of biasing response sets."

Paykel, E. S., Uhlenhuth, E. H.: "Rating the magnitude of life stress." *Can. Psychiatr. Assoc. J.* 17 Supp. 2: SS93-SS100 (1972).

J13,508/72

A questionnaire inquiring to what extent sixty-one life events (ranging from death of child or spouse to trivial or desirable experiences) produced substantially similar reactions in different socio-demographic groups. [Very similar to the SRSS of Rahe and Holmes (H.S.).]

Leighton, D. C.: "Measuring stress levels in school children as a program-monitoring device." *Am. J. Public Health* 62: 799-800 (1972). G91,217/72

A simple and rapid program-monitoring test has been developed which lends itself to computer analysis. It consists of twenty psychologic screening questions followed by eight questions about the child's situation

and feelings. Girls and blacks have disproportionately high stress scores.

Heisel, J. S.: "Life changes as etiologic factors in juvenile rheumatoid arthritis." *J. Psychosom. Res.* **16**: 411-420 (1972).

J19,671/72

Children who develop juvenile rheumatoid arthritis or Still's disease "tend to have recently experienced a cluster of changes in their world, higher in amount and intensity than the average child." Several life change questionnaires have been worked out for different age groups.

Nelson, P., Mensh, I. N., Hecht, E., Schwartz, A. N.: "Variables in the reporting of recent life changes." *J. Psychosom. Res.* **16**: 465-471 (1972).

J19,897/73

"The Index of Emotional Stress (IES) successfully discriminated between users and nonusers of a large public university mental health clinic."

Ramprasad, G.: "Evaluation of stress in non-manual work: an empirical investigation." *Indian J. Med. Res.* **61**: 1714-1721 (1973).

J12,450/73

Description of a questionnaire designed to test stress and work satisfaction among the personnel of research and teaching institutions.

Smith, R. C., Melton, C. E. Jr.: "Susceptibility to anxiety and shift difficulty as determinants of state anxiety in air traffic controllers." *Federal Aviation Administration, Aviation Med. pamphlet*, pp. 1-3. Washington, D.C., 1973.

J17,246/73

Anxiety proneness scores as determined by the STAI "were predictive of the general A-state level of controllers, but were not predictive of the degree of anxiety experienced under the stress of difficult shifts."

Holmes, T. H., Masuda, M.: "Life change and illness susceptibility." In: Scott, J. P. and Seney, E., *Separation and Depression*, pp. 161-186. Washington, D.C.: Amer. Assoc. Advancement of Science, 1973.

J10,480/73

Detailed description of the SRSS which is meant to give an objective assessment of an individual's adaptive and coping behavior in dealing with stress, regardless of the desirability of an event.

Cochrane, R., Robertson, A.: "The Life Events Inventory: a measure of the relative severity of psycho-social stressors." *J. Psychosom. Res.* **17**: 135-139 (1973).

J726/73

The LEI of Rahe and Holmes has three distinct advantages over the SRE: "it is more comprehensive; more consistent in the kind of events included, and has weights derived from groups most likely to have experience of the events involved."

Cline, D. W.: "A stress-value scale for officer candidates." *J. Psychosom. Res.* **17**: 15-20 (1973). G98,344/73

An SVS has been established for officer candidates by asking 191 trainees to assign values from 0 to 1000 to twenty-eight items encountered in their daily life (for example, assuming command position, lack of sleep, writing examinations, corrective criticism from superior).

Reeder, L. G., Schrama, P. G. M., Dirken, J. M.: "Stress and cardiovascular health: an international cooperative study. I." *Soc. Sci. Med.* **7**: 573-584 (1973). J15,755/73

The data obtained from questionnaires used in the SSS correlate well with a similar psychosomatic stress scale developed in the Netherlands. An extensive study on postal and telegraph workers indicated that "a relatively low job level was related to a relatively high number of EKG abnormalities. These latter findings may be predictive of future coronary artery disease in this group" (53 refs.).

Rahe, R. H.: "Life change and subsequent illness reports." In: Gunderson, E. K. E. and Rahe, R. H., *Life Stress and Illness*, pp. 58-78. Springfield, Ill.: Charles C Thomas, 1974.

E10,682/74

Detailed discussion of the SRE questionnaire in relation to subsequent illness (28 refs.).

Nelson, P. D.: "Comment." In: Gunderson, E. K. E. and Rahe, R. H., *Life Stress and Illness*, pp. 79-89. Springfield, Ill.: Charles C Thomas, 1974. E10,683/74

Comments on the SRE questionnaire.

Ander, S., Lindstrom, B., Tibblin, G.: "Life changes in random samples of middle-aged men." In: Gunderson, E. K. E. and Rahe, R. H., *Life Stress and Illness*, pp. 121-

124. Springfield, Ill.: Charles C Thomas, 1974. E10,686/74

The SRE questionnaire correlates fairly well with CHD in a retrospective study.

Horowitz, M. J., Schaefer, C., Cooney, P.: "Life event scaling for recency of experience." In: Gunderson, E. K. E. and Rahe, R. H., *Life Stress and Illness*, pp. 125-133. Springfield, Ill.: Charles C Thomas, 1974.

E10,687/74

Discussion of factors which influence the stress value of life events in the SRE questionnaire, such as age, sex, time elapsed since the event and so on.

Stress Interviews. The so-called "stress interviews" have become very popular, especially in industry, the army and the air force, to appraise a candidate's suitability for a demanding job. In general, they are based on behavior (poised, resourceful, well-adjusted, nervous) and somatic reactions (blood pressure variations, heart rate, cutaneous conductance, plasma hormone levels) during and after the interview, which is planned to be disturbing or confusing and which demands of the candidate a high degree of self-control. Often, such interviews are coupled with interfering distractive stimuli.

Stress Interviews. Freeman, G. L., Manson, G. E., Katzoff, E. T., Pathman, J. H.: "The stress interview." *J. Abnorm. Soc. Psychol.* **37**: 427-447 (1942). B26,742/42

General description of stress interview techniques in selecting proper candidates for a variety of tasks. "The stress interview is designed to select those individuals, who, when highly aroused internally, are able to maintain such intelligent control over their behavior as to be judged 'poised,' 'master of the situation,' 'resourceful,' and 'well adjusted.' It appears that some individuals manifest these attributes better when under stress than when under non-stress conditions. Another important aspect of the personality structure is the rate of recovery in outward poise and higher-order control of total behavior following removal of the stress situation. Adequate control of self during stress and quick recovery of higher-order adjustments after stress is removed are the qualities sought in candidates selected by the stress-interview technique."

Freeman, G. L.: "Suggestions for a standardized 'stress' test." *J. Gen. Psychol.* **32**: 3-11 (1945). 35,101/45

Any complex discrimination problem coupled with interfering distraction stimuli will arouse emotional stress if the subject considers the outcome important for his future or a threat to his present security. There are several possible ways of constructing stress tests on the basis of ability to manipulate machines or answer questions under difficult conditions, and evaluation of the results may be reinforced by such objective indices as GSR.

Wolf, S., Cardon, P. V. Jr., Shepard, E. M., Wolff, H. G.: *Life Stress and Essential Hypertension. A Study of Circulatory Adjustments in Man*, p. 253. Baltimore: Williams & Wilkins, 1955. E145/55

tional Hypertension. A Study of Circulatory Adjustments in Man, p. 253. Baltimore: Williams & Wilkins, 1955. E145/55

Monograph on the role of stress in the production of essential hypertension in man. Principal emphasis is placed upon stress interviews and a cold pressor test as diagnostic indices. Adrenocortical participation is only briefly considered (158 refs.).

Hetzell, B. S., Schottstaedt, W. W., Grace, W. J., Wolff, H. G.: "Changes in urinary 17-hydroxycorticosteroid excretion during stressful life experiences in man." *J. Clin. Endocrinol. Metab.* **15**: 1057-1068 (1955). C8,424/55

In patients a one-hour discussion of "stressful subjects" caused diuresis with increased excretion of 17-OHCS, nitrogen, sodium and potassium.

Cline, V. B.: "Ability to judge personality assessed with a stress interview and sound-film technique." *J. Abnorm. Soc. Psychol.* **50**: 183-187 (1955). J1,948/55

Analysis of the predictive value of sound movies or stress interviews.

Miller, L. H., Shmavonian, B. M.: "Repli-

cability of two GSR indices as a function of stress and cognitive activity." *J. Pers. Soc. Psychol.* **2**: 753-756 (1965). J8,698/65

Through the use of GSR as an indicator of

psychogenic stress during stress interviews, "it was concluded that the changes following the interview could not be attributed solely to the interview."

Media. The viewing of films or television shows which cause arousal (pornographic, suspenseful, cruel or fear-inspiring subjects) or relaxation (nature films, mild humor) may be employed to assess a subject's predisposition to psychogenic stress, using objective indicators such as blood catecholamines, glucose, FFA, triglycerides, blood pressure, cutaneous conductance and so on as measures of the stress produced.

Media. Speisman, J. C., Osborn, J., Lazarus, R. S.: "Cluster analyses of skin resistance and heart rate at rest and under stress." *Psychosom. Med.* **23**: 323-343 (1961).

D10,039/61

Handlon, J. H., Wadeson, R. W., Fishman, J. R., Sachar, E. J., Hamburg, D. A., Mason, J. W.: "Psychological factors lowering plasma 17-hydroxycorticosteroid concentration." *Psychosom. Med.* **24**: 535-542 (1962). D46,696/62

Viewing Disney nature-study films actually lowers 17-OHCS levels, whereas arousing films have an opposite effect. The former "may serve to narrow the subjects' attention away from other possibly stressful stimuli of either internal or external origin."

Lazarus, R. S., Speisman, J. C., Mordkoff, A. M., Davison, L. A.: "A laboratory study of psychological stress produced by a motion picture film." *Psychol. Monogr.* **76**: 1-35 (1962). J11,289/62

Detailed description of a technique for measuring stress reactions by having subjects view a "stressor film" on subincision that "vividly presents a sequence of crude operations performed with a piece of flint on the penis and scrotum of several adolescent boys." The psychologic reactions to this experience are then estimated on the basis of answers to a standard questionnaire and are compared with the response to a control film (*Corn Farming in Iowa*) which has no emotionally charged content. Apart from the psychologic effects, the authors also measured GSR and heart rate.

Handlon, J. H.: "Hormonal activity and individual responses to stresses and easements in everyday living." In: Roessler, R. and Greenfield, N. S., *Physiological Correlates of Psychological Disorder*, pp. 157-170. Madison: University of Wisconsin Press, 1962. D55,075/62

The plasma 17-OHCS levels of normal persons are increased during viewing of "arousing" films, whereas "bland" films have an opposite effect.

Wadeson, R. W., Mason, J. W., Hamburg, D. A., Handlon, J. H.: "Plasma and urinary 17-OHCS responses to motion pictures." *Arch. Gen. Psychiatry* **9**: 146-156 (1963).

E22,691/63

"Significant elevations in plasma 17-OHCS levels were observed during a war movie in one group. Marked decreases in plasma 17-OHCS levels occurred rather consistently during the viewing of Disney nature films. Plasma and urinary values did not consistently correlate well, and plasma measurements were regarded as more reliable."

Mordkoff, A. M.: "The relationship between psychological and physiological response to stress." *Psychosom. Med.* **26**: 135-150 (1964). G12,092/64

During viewing of *Subincision*, a "stressor film" depicting the puberty rites of an Australian aboriginal tribe (crude operations performed with a piece of flint on the penis and scrotum of adolescent boys), the ratings of psychologic impact upon the audience were closely related to such physiologic indices of stress as GSR, heart rate and respiration (21 refs.).

Speisman, J. C., Lazarus, R. S., Davison, L., Mordkoff, A. M.: "Experimental analysis of a film used as a threatening stimulus." *J. Consult. Psychol.* **28**: 23-33 (1964).

J23,441/64

Tannenbaum, P. H., Gaer, E. P.: "Mood change as a function of stress of protagonist and degree of identification in a film-viewing situation." *J. Pers. Soc. Psychol.* **2**: 612-616 (1965). J8,271/65

Among subjects viewing films with a happy or unhappy ending, those identifying more with the hero experienced significantly

more stress than those identifying less. The degree of stress was rated only on the basis of answers to a questionnaire.

Lazarus, R. S., Opton, E. M. Jr.: "The study of psychological stress: a summary of theoretical formulations and experimental findings." In: Spielberger, C. D., *Anxiety and Behavior*, pp. 225-262. New York and London: Academic Press, 1966.

J10,620/66

Detailed description of the authors' use of films, occasionally combined with tape recording, in order to produce psychogenic stress. GSR and heart rate proved to be helpful objective indicators of autonomic activity, yet the two were not necessarily parallel. This may be due to differences in endocrine sensitivity.

Goldstein, M. J., Jones, R. B., Clemens, T. L., Flagg, G. W., Alexander, F. G.: "Coping style as a factor in psychophysiological response to a tension-arousing film." *J. Pers. Soc. Psychol.* **1**: 290-302 (1966).

Carruthers, M., Taggart, P.: "Vagotonicity of violence: biochemical and cardiac responses to violent films and television programmes." *Br. Med. J.* August 18, 1973, pp. 384-389. H74,499/73

Description of the changes in blood EP, glucose, FFA, triglycerides and STH that occurred in men and women watching films and television programs depicting violence, humor or suspense. "Groups of people taken

to see two particularly violent films showed similar evidence suggesting vagal overactivity, together with increases in plasma free fatty acids and decreases in triglycerides. As these changes occurred even with β -blockade it is suggested that they might be caused by non-sympathetically mediated changes in the levels of hormones, such as growth hormone, producing lipolysis."

Horowitz, M. J.: "Phase oriented treatment of stress response syndromes." *Am. J. Psychother.* **27**: 506-515 (1973). J17,978/73

In concentration camp survivors, psychologic "stress response syndromes" may persist for decades. Their characteristics are classified, and treatment schedules are recommended. Even viewing "stress films" may induce persistent, intrusive and repetitive thoughts in normal subjects (23 refs.).

Ancona, L., Capoleoni, M.: "L'aggressione giustificata e non giustificata attraverso il dosaggio catecolaminico" (Justified and unjustified aggression through dosage of catecholamines). *Totus Homo* **5**: 17-26 (1974). H97,091/74

In man, "stress produced by a stimulus set on film representing a sadistic scene induces diverse biochemical and psychodynamic reactions depending on whether the subject thinks that the stressing action seen by him is justified or not. When the subject watches an action that he judges socially and normally deplorable, the ratio of noradrenaline/adrenaline excreted in the urine varies in favor of the adrenaline and there is a significant increase in the projected aggressiveness."

Flicker Fusion Frequency. This test is based on the ability to distinguish between separate flickers and their fusion with increasing flicker rates. However, well-controlled experiments failed to confirm the validity of this alleged stress indicator.

Flicker Fusion Frequency. Brozek, J., Simonson, E., Taylor, H. L.: *Changes in Flicker Fusion Frequency Under Stress*, p. 5. Randolph Field, Texas: USAF School of Aviation Med. Report No. 3, 1953. B94,564/53

The flicker fusion frequency test is based on the ability to distinguish between separate flickers and fusion with increasing flicker rates. Performance has previously been claimed to be impaired during stress, but in the present experiments work in a laboratory,

illumination, nutritional stressors, physical effort and so on failed to confirm the validity of this alleged indicator.

Kubzansky, P. E.: "Anxiety, stress, and flicker fusion measurements" (abstracted). *Am. Psychol.* **9**: 410-411 (1954). J13,187/54

"There were no effects in the flicker measures attributable to stress."

Landis, C., Clausen, J., Gjesvik, A.: "Effect of varying stimulus conditions on the

flicker-fusion threshold when nitroglycerin or the cold pressor test was employed." *J. Appl. Physiol.* **7**: 513-518 (1955). J25,408/55

Nair, C. S., Malhotra, M. S., Gopinath, P. M.: "Effect of altitude acclimatization and simultaneous acclimatization to altitude

and cold on critical flicker frequency at 11,000 ft. altitude in man." *Aerosp. Med.* **43**: 1097-1100 (1972). H81,634/72

In healthy men, acclimatization to high altitude did not significantly affect critical flicker frequency, whereas "cold stress produced a profound deterioration."

Culture Stress. The index of "culture stress" is based on a comparison of traditions and social habits in a large number of totally dissimilar societies of different races. Protest suicide, defiant homicide, drunken brawling and witchcraft attribution were used as tentative indices of "culture stress." These aspects have repeatedly been discussed in relation to the G.A.S.

Culture Stress. Naroll, R.: "A tentative index of culture-stress." *Int. J. Soc. Psychiatry* **5**: 107-116 (1959). J11,585/59

A tentative index of "culture-stress" in thirty-seven totally dissimilar societies and races, based upon comparison of four symptoms: protest suicide, defiant homicide, drunken brawling and witchcraft attribution. This report reviews the theoretical grounds for supposing each indicator to be a symptom of culture-stress and offers a formal set of definitions, rules and corollaries to delineate each. "The construction of the index is described and its validity and reliability discussed."

Naroll, R.: *Data Quality Control: A New Research Technique. Prolegomena to a Cross-cultural Study of Culture Stress*, p. 198. Glencoe, Ill.: Free Press, 1962.

E10,632/62

A monograph on "culture stress" with reference to the G.A.S. Special attention is given to witchcraft attribution as a symptom of culture stress, and an extensive bibliography on this topic is provided. There is also an "index of culture stress," based upon this phenomenon and such others as drunken brawling, defiant homicide and protest suicide among numerous peoples of different racial and ethnic backgrounds.

Rorschach Test. Although often recommended to appraise actual psychogenic stress or predisposition to it, the Rorschach test was not found to be especially instructive and it lost its popularity.

Rorschach Test. Williams, M.: "An experimental study of intellectual control under stress and associated Rorschach factors." *J. Consult. Psychol.* **11**: 21-29 (1947) (29 refs.). B75,220/47

Eichler, R. M.: "Experimental stress and alleged Rorschach indices of anxiety." *J. Abnorm. Soc. Psychol.* **46**: 344-355 (1951). G65,604/51

Rorschach indices did not prove to be particularly reliable for the detection of stress.

Smith, S., George, C. E.: "Rorschach factors related to experimental stress." *J. Consult. Psychol.* **15**: 190-195 (1951). E41,451/51

Eriksen, C. W., Lazarus, R. S., Strange, J. R.: "Psychological stress and its personality correlates. Part II. The Rorschach test and other personality measures." *J. Pers.* **20**: 277-286 (1952). B29,029/52

A review on various personality tests designed to predict performance under psychogenic stress. "No relationships were found between performance under stress from various personality measures. No relationships were found between performance under stress and any Rorschach variable. Some nonsignificant trends were found on the Guilford-Martin Inventory of Factors (GAMIN) and the Bell Adjustment Inventory indicating that subjects who improve in performance under stress are more ascendant and have greater self-confidence." It is concluded that subjects themselves can usually predict how they would perform under stress, and "with our present techniques, the best way to predict how a man will perform under stress is to ask him."

Carlson, V. R., Lazarus, R. S.: "A repetition of Meyer Williams' study of intellectual control under stress and associated Ror-

schach factors." *J. Consult. Psychol.* **17**: 247-253 (1953). B26,577/53

Careful personal studies and a review of the literature suggest that, contrary to the claims of Meyer Williams, there is no relationship between Rorschach variables and performance under stress (13 refs.).

Westrope, M. R.: "Relations among Rorschach indices, manifest anxiety, and performance under stress." *J. Abnorm. Soc. Psychol.* **48**: 515-524 (1953). J13,304/53

Problem Solving (including Pursuit Meter Test). Various psychogenic and even physical stressors interfere with the solving of a great variety of problems that have been selected to test not only the stressor effect of solving the problem but the ability to do so. Among these, the following have enjoyed particular popularity: the SAM Rotary Pursuit Test with Divided Attention, the Hoagland-Werthessen Pursuit Meter test and the WCST. The pursuit meter tests are based on the ability to track a moving target, thus imitating the problem of fighter pilots. Digit span tests require the subject to repeat an increasingly long number of digits, forward and backward, often in the presence of disturbing circumstances. In addition, arithmetic calculation tasks performed under unfavorable circumstances have been employed to test stress resistance, using corticoids, FFA, blood pressure, electrolytes, cholesterol, neck muscle potentials, finger movements, heart rate, blockade of alpha rhythm in the EEG and so on as indicators.

Problem Solving (including Pursuit Meter Test). Hoagland, H., Pincus, G., Elmadjian, F.: "Stressful psychomotor performance and adrenal cortical function in man." *Fed. Proc.* **5**: 48 (1946).

A95,861/46

In men breathing air low in oxygen, performance (as scored on the Hoagland pursuit meter) shows a decline roughly parallel to the degree of lymphopenia and the rise in urinary 17-KS.

Deese, J., Lazarus, R. S.: *The Effects of Psychological Stress upon Perceptual-Motor Performance*, p. 15. Research Bulletin 52-19. Human Resources Research Center. San Antonio, Texas: Lackland Air Force Base, 1952.

G27,359/52

Description of the "SAM Rotary Pursuit Test With Divided Attention" for the measurement of performance, especially under the influence of stress caused by failure, in Air Force trainees.

Ross, B. M., Rupel, J. W., Grant, D. A.: "Effects of personal, impersonal, and physical stress upon cognitive behavior in a card sorting problem." *J. Abnorm. Soc. Psychol.* **47** Supp.: 546-551 (1952). B29,005/52

A study of the effect of various stressors ("heckling," electric shock and auditory distraction) upon performance in the WCST. "Electric shock, the physical threat, alone or in combination with other factors, was the only variable which degraded performance on

the WCST to a statistically significant extent" (16 refs.).

Hoagland, H., Bergen, J. R., Bloch, E., Elmadjian, F., Gibree, N. R.: "Adrenal stress responses in normal men." *J. Appl. Physiol.* 8: 149-154 (1955). C12,916/55

Manipulation of the Hoagland-Werthessen pursuit meter was used as a stress test. Young men (sixteen to twenty years) "appear to call very little on adrenal cortical mechanisms to meet stresses which enhance adrenocortical responses of older men. Eosinopenia correlates better with the urinary excretion" of EP than with that of 17-KS. Both are regarded as indicators of adrenocortical activity.

Kakizaki, T.: "6. Effect of unpleasant feeling due to pure sound noise on the stress response during arithmetical calculation tasks." *Ind. Health (Kawasaki)* 11: 77-83 (1973).

J10,266/73

Detailed description of a test in which responses (corticoid, FFA, blood pressure, electrolytes, blood proteins, cholesterol and so on) are used as indicators of the stress produced by arithmetic calculations. Both the difficulty and the duration of the task are of significance, but curiously, several interfering unpleasant factors (for example, sound) do not significantly affect the results.

O'Hanlon, J. F., Horvath, S. M.: "Interrelationships among performance, circulating concentrations of adrenaline, noradrenaline, glucose, and the free fatty acids in men performing a monitoring task." *Psychophysiology* 10: 251-259 (1973). J3,116/73

In young men performing an exacting vigilance test, basal levels of blood EP and NEP were inversely related to glucose. EP initially increased during the test but later returned to its basal level in proportion to performance. NEP was not related to performance. Glucose and FFA were elevated both during the task and throughout a control period spent watching slide projections.

Trumbo, D. A.: "Some laboratory tasks for the assessment of stressor effects." *Psychiatr. Neurol. Neurochir.* 76: 199-207 (1973).

J5,079/73

Brief survey of the literature on various performance tasks that have been recommended to assess the severity of stress (vigilance, tracking, reaction time, serial reactions and so on).

Shearer, E., Fulkerson, F. E.: "The effects of physical and psychological stress on the performance of high- and low-anxious Ss on a difficult verbal discrimination task." *Bull. Psychonomic Soc.* 1: 255-256 (1973).

H91,958/73

Studies with the TMAS on performance in verbal discrimination tasks.

Temperature. A standardized pain stimulus may be used to quantify a subject's responsiveness to a stressor. For example, the application of heat to the forehead produces lymphopenia as well as changes in cutaneous conductance and EEG, and these have been employed to test the stress resistance of psychoneurotics. For such purposes, a special thermal stimulator was designed which has shown that schizophrenics exhibit a relative lack of discrimination among various pain intensities.

In this connection, the well-known "cold pressor test" might also be mentioned, especially since, in addition to causing a rise in blood pressure, the application of cold also produces other manifestations of stress, such as changes in heart rate, cutaneous conductance and so on.

Temperature. Malmo, R. B., Shagass, C., Davis, J. F., Cleghorn, R. A., Graham, B. F., Goodman, A. J.: "Standardized pain stimulation as controlled stress in physiological studies of psychoneurosis." *Science* **108**: 509-511 (1948). B47,043/48

In psychoneurotics, heat applied to the forehead caused stress as indicated by lymphopenia as well as by GSR and EEG changes. It is concluded that pain tests "may profitably be employed in more extensive analyses of disturbances in mental patients undergoing stress."

Malmo, R. B., Shagass, C.: "Physiologic studies of reaction to stress in anxiety and early schizophrenia." *Psychosom. Med.* **11**: 9-24 (1949). B47,045/49

Quantifiable stress was produced in man by

a standardized series of painful stimulations administered by means of a Hardy-Wolff thermal stimulator. Used as indicators of stress were finger movements, neck muscle potentials, GSR, heart rate, blocking of the α -rhythm in the EEG and so on. Schizophrenics showed a relative lack of discrimination among various pain intensities.

Lacey, J. I., Lehn, R. van: "Differential emphasis in somatic response to stress. An experimental study." *Psychosom. Med.* **14**: 71-81 (1952). J13,182/52

Measurements of heart rate, blood pressure and palmar conductance as indicators of stress during the "cold pressor test," with a discussion of the methodological and theoretical implications.

Cutaneous Conductance, Sweating, GSR. An increased secretion by the sweat glands, especially palmar sweating, is a very popular index of psychogenic stress. It can be measured by colorimetric techniques but is measured more accurately by GSR, both of which reflect cutaneous conductance. It is not yet quite clear to what extent changes in the conductance of the skin tissues themselves contribute to those induced by an increase of sweat.

In any event, the GSR has proven to be an adequate indicator of stress produced by anxiety, the viewing of cruel or sexually arousing films, the threat of electroshocks, stress interviews and so on.

Cutaneous Conductance, Sweating, GSR. Furer, M., Hardy, J. D.: "The reaction to pain as determined by the galvanic skin response." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 72-89. Baltimore: Williams & Wilkins, 1950. B51,896/50

Extensive studies on man exposed to pain (heat) in hot or cold environments as well as after induced anxiety led to the conclusion that the GSR is a good index of stress under these conditions (35 refs.).

Bixenstine, V. E.: "A case study of the

use of palmar sweating as a measure of psychological tension." *J. Abnorm. Soc. Psychol.* **50**: 138-143 (1955). B29,398/55

Description of a colorimetric method for measuring palmar sweating objectively. The test is recommended as a counterpart to the GSR measurements to indicate psychogenic tension.

Beam, J. C.: "Serial learning and conditioning under real-life stress." *J. Abnorm. Soc. Psychol.* **51**: 543-551 (1955). J10,605/55

The stress of academic examinations seri-

ously interfered with serial learning of a list of nonsense syllables. Stress was appraised by the palmar sweat index.

Adrenocortical Function Tests. A variety of tests have been designed to examine the functional reactivity of the hypothalamus-pituitary-adrenocortical axis. Some of these have been discussed in detail elsewhere in this volume, for example, the inhibition of ACTH production by the corticoid feedback mechanism. In clinical medicine, dexamethasone is most commonly used for this purpose and it has been shown that in some diseases (for example, in certain psychiatric disturbances) the feedback mechanism is defective.

On the other hand, injections of EP or bacterial pyrogens normally stimulate CRF release and consequently increase the production of ACTH and of glucocorticoids, as long as the structures of the hypothalamus-pituitary-adrenocortical axis are intact.

Metyrapone reduces cortisol production by inhibition of 11β -hydroxylation. Thus, the biosynthesis of cortisol, the principal adrenal glucocorticoid in man, is blocked at the 11-desoxycortisol level, a compound which has practically no suppressing effect upon ACTH release. Normally, administration of metyrapone causes a compensatory increase in ACTH release and the secretion of 11-desoxycorticosterone (a 17-OHCS) in the urine. In patients with diseases of the hypothalamus-pituitary axis who are unable to respond with this compensatory reaction, the diminution or absence of increased

17-OHCS excretion after metyrapone is of diagnostic value. Although this is not strictly speaking a "stress test," it does deserve mention here because it assesses the functional activity of structures indispensable for a normal response to stressors.

Adrenocortical Function Tests. Faurbye, A., Vestergaard, P., Kobbernagel, F., Nielsen, A.: "Adrenal cortical function in chronic schizophrenia (stress, adrenaline-test, ACTH-test)." *Acta Endocrinol. (Kbh.)* 8: 215-246 (1951). B63,996/51

In man, EP treatment and the production of fever by injections of killed *B. faecalis alcaligenes* are regarded as adequate "stress tests," as indicated by the increase in uric acid and potassium excretion, as well as the hematologic changes that result.

Elmadjian, F., Hope, J. M., Lamson, E. T.: "Excretion of epinephrine and norepinephrine under stress." *Rec. Prog. Horm. Res.* 14: 513-553 (1958). C57,735/58

Observations on people exposed to various types of stressors "support the hypothesis that active aggressive emotional displays are related to increased excretion of NE, whereas tense, anxious, but passive, emotional displays are related to increased excretion of E in association with normal excretion of NE."

Jovy, D., Brüner, H., Klein, K. E., Wegmann, H. M.: "Adaptive responses of adrenal cortex to some environmental stressors, exercise and acceleration." In: Martini, L. and

Pecile, A., *Hormonal Steroids. Biochemistry, Pharmacology, and Therapeutics*, p. 545. New York and London: Academic Press, 1965.

E5,499/65

Plasma corticoid and eosinophil determinations in healthy young men exposed to several stressors encountered during space flights (hypoxia, cold, heat, acceleration, muscular work). The results of exposure to these stressors, alone or in various combinations, are taken as an expression of the individual sensitivity towards stress, and offer a criterion of practical importance.

Jenkins, J. S.: "The pituitary-adrenal response to pyrogen." In: James, V. H. T. and Landon, J., *Memoirs of the Society for Endocrinology*, No. 17, pp. 205-212. Cambridge: Cambridge University Press, 1968.

E7,508/68

In man the stressor effect of bacterial pyrogens provides a useful test of pituitary-adrenal reactivity, as indicated by the resulting increase in plasma cortisol. "If our present views on the pituitary site of its action are correct, the pyrogen test would seem to be complementary to such procedures as the vasopressin test, where the site of action seems to lie in the hypothalamus."

Multifactorial Stress Tests. As we explained before, on the basis of present-day knowledge, it is virtually impossible to recommend or even imagine any single indicator that would truly reflect stress, or the "nonspecific response of the organism to any demand made upon it." This may become possible after we have identified the "first mediator" (if it is a single substance) which relays the message from any peripheral tissue to the neurohormonal regulators of defense that a condition of stress exists.

Most of the "stress tests" now in use actually reflect only psychogenic stress and are not applicable to the estimation of such somatic stress situations as those caused by loss of blood, chemical toxicants or extremes of temperature. This is particularly obvious in the case of the Rorschach test, problem solving, or stress interviews. In addition, several tests are presently used to measure the specific effects of certain stressors; for example, the GSR would show a misleadingly high response to heat stress because sweating is specifically stimulated by high temperatures. Probably, direct determination of "stress hormones," such as catecholamines, ACTH or corticoids in the blood and/or urine, as well as the eosinopenia of stress, are least conducive to such misinterpretations.

In view of these factors, which diminish the significance of stress tests based upon the determination of any individual indicator, several batteries or combinations of tests have been recommended. In these, the average value of the most reliable indicators of nonspecific responses is considered to reflect stress as such.

Of course these tests are laborious because numerous endpoints must be determined to eliminate, as far as possible, distortions occasioned by specific responses. However, at the present time, multifactorial stress tests are still the best, especially if they include the many reliable indicators of nonspecific reactions, such as determinations of ACTH, corticoids, catecholamines, blood eosinophils and plasma FFA.

Another type of multifactorial stress test is based upon exposure of a subject to a great variety of stressors to determine his general resistance. However, these examinations are rarely meaningful except within a limited field. For example, it is possible to select a number of stressors likely to be encountered in aviation, business life or muscular exercise and for practical purposes, these will give a fairly instructive picture of a candidate's probable suitability for a particular task but not of his stress resistance in general.

Multifactorial Stress Tests. Rodnick, E. H., Rubin, M. A., Freeman, H.: "Related studies on adjustment. Reactions to experimentally induced stresses." *Am. J. Psychiatry* **99**: 872-880 (1943). B26,250/43

Comparative studies on the value of a battery of tests to measure stress in a camp devoted to instruction for industrial occupations.

Pincus, G., Hoagland, H., Freeman, H., Elmadjian, F.: "Adrenal function in mental disease." *Rec. Prog. Horm. Res.* **4**: 291-322 (1949). B41,235/49

Rather than using any single indicator of stress, the authors recommend a "total response index" (TRI). "This is obtained by employing the data of the principal indices of adrenocortical activity, namely 17-ketosteroid and neutral reducing lipide outputs, the potassium, sodium, and uric acid excretions, and the blood lymphocyte changes. The value is constructed for each individual by averaging the stress and poststress percentage increases of the urinary determinations with twice the stress and poststress lymphocyte percentage decreases" (20 refs.).

Parsons, O., Phillips, L.: "Some problems associated with development of stress scores for the individual." *J. Appl. Physiol.* **6**: 691-695 (1954). J13,191/54

Observations on the correlation between 17-KS excretion, eosinopenia, and psychomotor performance tests following exposure to various stressors (air blasts, intense light, sound and so on) have led to attempts to develop meaningful "stress scores."

Kraft, J. A.: "Measurement of stress and fatigue in flight crews during confinement." *J. Aviat. Med.* **30**: 424-430 (1959).

C70,483/59

Description of an elaborate facility for the

automatic measurement and registration of various stress indices (skin temperature, heart rate, respiratory cycle, muscular tension, GSR and so on) as they are affected by the stressors to which flight crews and astronauts are likely to be exposed (for example, gravity forces, loneliness, confinement, isolation, sensory deprivation).

Dykman, R. A., Ackerman, P. T., Galbrecht, C. R., Reese, W. G.: "Physiological reactivity to different stressors and methods of evaluation." *Psychosom. Med.* **25**: 37-59 (1963). J23,479/63

Thiesen, J. W., Forgas, R. H., Spaner, F. E.: "An objective method of assessing a stress syndrome related to achievement motivation." *Percept. Mot. Skills* **19**: 183-197 (1964). G35,813/64

A multifactorial battery of stress tests "indicate that the sustained heart-rate response, as utilized in this procedure, is a sensitive and convenient measure of stress associated with achievement motivation. It is suggested that the test battery and methodology described may be useful in research concerning striving-induced stress and its role in psychosomatic disorders."

Thiesen, J. W., Brown, K. D., Forgas, R. H., Evans, S. M., Williams, G. M., Taylor, J.: "Further data on a stress syndrome related to achievement motivation: relationships with age and basal serum cholesterol level." *Percept. Mot. Skills* **20**: 1277-1292 (1965). G35,812/65

Verification of a multifactorial stress test based on heart rate acceleration. "While a tendency toward higher over-all heart rates with increased age was observed, the principal specific finding was a positive association of basal serum cholesterol level with poststress heart rate, independent of age. Indi-

viduals with higher serum cholesterol levels showed less complete recovery following stress and higher initial heart rates, but they did not necessarily show a stronger immediate response to the stressors."

Klein, K. E., Brüner, H., Ruff, S.: "Untersuchungen zur Belastung des Bordpersonals auf Fernflügen mit Düsenmaschinen" (Evaluation of resistance to stress in air crew members on transatlantic jet flights). *Z. Flugwisschft.* **14**: 109-121 (1966).

G42,395/66

An attempt to evaluate resistance to fatigue using blood circulation, pulse rate, ECG, oral temperature and motor coordination as indices.

Fleishman, E. A.: "Performance assessment based on an empirically derived task taxonomy." *Hum. Factors* **9**: 349-366 (1967).

J7,673/67

Technique for the assessment of general performance based on an empirically developed task taxonomy. Allegedly, it is suitable for appraising the effect of stress upon efficiency in general.

Hale, H. B., Anderson, C. A., Williams, E. W., Tanne, E.: "Endocrine-metabolic effects of unusually long or frequent flying missions in C-130E or C-135B aircraft." *Aerosp. Med.* **39**: 561-570 (1968).

G63,855/68

"Flight-stress appraisal was made by means of a battery of urinary determinations (epinephrine, norepinephrine, 17-OHCS, urea, uric acid, phosphorus, magnesium, sodium, and potassium) for flyers who participated in (a) 20-hour missions in C-130E aircraft (flights from New Zealand to Antarctica, and back), (b) 6-day missions in C-135B aircraft (earth-circling missions) or (c) 7-week missions in C-135B aircraft (overfrequent transoceanic and transconti-

nental flying). The adrenal medulla (judging by urinary epinephrine) consistently showed flight-sensitivity, but other endocrine-metabolic functions varied in ways indicative of adaptation." East- and westbound earth-circling missions did not elicit essentially different degrees of flight-stress as indicated by the above-mentioned indices.

Mefferd, R. B. Jr., Hale, H. B., Shannon, I. L., Prigmore, J. R., Ellis, J. P. Jr.: "Stress responses as criteria for personnel selection: baseline study." *Aerosp. Med.* **42**: 42-51 (1971).

G99,772/71

Exploratory studies on the feasibility of using a battery of tests for the selection of stress-resistant personnel for Air Force duty. Moderate hypoxia was employed as a stressor, and various psychologic and metabolic changes were used as indicators. A number of potentially useful indices are listed, but no definite combination of these is recommended as an overall stress resistance test.

Wardwell, W. I.: "A study of stress and coronary heart disease in an urban population." *Bull. N.Y. Acad. Med.* **49**: 521-531 (1973).

J3,167/73

A technique for the assessment of stress is developed by combined evaluation of socio-economic status, social stress, physical illness, emotional stability and behavioral pattern in an urban population.

Smith, J. J., Bonin, M. L., Wiedmeier, V. T., Kalbfleisch, J. H., McDermott, D. J.: "Cardiovascular response of young men to diverse stresses." *Aerosp. Med.* **45**: 583-590 (1974).

J13,387/74

Comparative studies on the interpretation of eight stress tests (postural, cold pressor, Valsalva, various exercise stresses) with respect to cardiovascular responses in healthy young men.

Special Instruments. A number of special instruments for the measurement of stress reactions have already been mentioned, for example, various pursuit meters and the machinery necessary for the determination of the EEG, GSR, EMG, and so on.

Here, we merely want to call attention to the polygraphs that simultaneously determine skin temperature, GSR, pulse rate, blood pressure, respiration and so on. A number of lie detectors and "stressalyzers" are based upon this principle. Some of these instruments are highly sophisticated and can even be used for biotelemetry in different operational environments. It is important, however, to select the parameters to be measured according to the type of stress situation for which the candidate is to be appraised.

Special Instruments. Gerard, D. L., Phillips, L.: "Relation of social attainment to psychological and adrenocortical reactions to stress." *Arch. Neurol. Psychiatry* **69**: 350-354 (1953). G85,802/53

A pinball-like device, the Rotter aspiration board, is manipulated by an experimenter so that the subject becomes inept after a period of successful performance. Subjects with high social attainment showed better adaptive responses and less pronounced increases in corticoid excretion than others, because they shifted their goals more realistically after failure.

Baker, L. M., Taylor, W. M.: "The relationship under stress between changes in skin temperature, electrical skin resistance, and pulse rate." *J. Exp. Psychol.* **48**: 361-366 (1954). J13,305/54

Polygraph recordings of skin temperature, GSR and pulse rate are used to appraise the degree of stress elicited by emotional excitement in man.

Tomberg, V. T.: "The monitoring of synergistic stress inducing environmental factors." *3rd Manned Space Flight Convention of NASA & AIAA*, p. 138. Houston, 1964.

G37,471/64

"A Bio-Instrumentation and Monitoring device is described which relates complex environmental variables such as altitude, O₂, CO₂, CO, Temperature-Humidity and radiation dose to the development of psycho-physiological stress for the purpose of controlling the environment in advance." If the astronauts or aircraft flight crews are instrumented, the onset of adverse reactions may be detected early when corrective action is still possible. [The instrument is not described in detail (H.S.).]

Kugelmas, S., Lieblich, I.: "Effects of realistic stress and procedural interference in experimental lie detection." *J. Appl. Psychol.* **50**: 211-216 (1966). J10,619/66

Contemporary professional lie detectors are based on "a limited number of polygraph instruments which usually include the following channels: (a) blood pressure and pulse rate, (b) respiration, and (c) galvanic skin response (GSR). The procedure for measuring blood pressure includes the use of a cuff placed around the upper arm of the subject." The GSR appears to be the most reliable of these indices, but reactivity is probably related to ethnic origin.

Ellestad, M. H.: "Telemetry in monitoring stress electrocardiograms." *Biomed. Sci. Instrum.* **3**: 249-256 (1967).

J23,433/67

Description of an instrument that records by telemetry a patient's ECG and blood pressure while he is exercising on a treadmill.

Fuchs-Schmuck, A., Naumann, H. J.: "Arbeitsphysiologische Belastungsuntersuchungen mit dem Kreislaufkontrollgerät 'Physiomat'" (Physiologic work stress studies using the blood circulation control device "Physiomat"). *Dtsch. Gesundheitsw.* **23**: 1280-1283 (1968).

J23,686/68

Rosenbrock, F.: "Hardware problems in ergonomics measurements." *Ergonomics* **14**: 617-623 (1971).

J19,713/71

Multichannel automatic data acquisition and processing instruments are described for the objective measurement of work loads on ATCs, using physiologic variables such as ECG, EMG, EOG (electro-oculogram), respiration and so on. "To correlate these variables with factors of stress and strain a coding is described, which renders the evaluation of a multi-dimensional work process study automatically and synchronously with the physiological data."

Buck, L.: *Performance Data for the NRC Stressalyzer*, p. 66. National Research Council Pamphlet. Res. Lab. Techn. Rep. LTR-CS-69. Ottawa, 1972.

J12,632/72

"The NRC Stressalyzer is a step-input pursuit tracking task used in studying human perceptual-motor skill." The paper sketches

the development of this instrument and defines the measures obtained from it.

Křišťian, L., Dvořák, M., Žáček, I., Pokorný, F.: "Experience with the application of biotelemetry (ECG, EMG) under strenuous working conditions in various operational environments." *Biotelemetry Int. Symp.*, pp. 289-297 (1972). H80,195/72

Buck, L., Leonardo, R.: *Sleep Patterns and Psychomotor Performance of Aircrew Flying the North Pacific*, p. 22. National Research Council, Div. Mech. Eng. Rep. LTR-CS-97. Ottawa, 1973. J10,491/73

Preliminary data on stress levels in aircrews flying the North Pacific, which are measured by means of the "stressalyzer." This is an instrument which permits objective assessment of a step-tracking task in which the subject pursues a light as it moves among five horizontally aligned positions. "The task is subject-paced, target movement depending on pointer alignment, and the coupling between control wheel and pursuit pointer is inverse, the two moving in opposite directions. The instrument yields a number of performance indices relating to the speed and accuracy of decision and movement." Due to various technical difficulties the application of the machine to this particular task did not yield definitive results.

Hatch, T. F.: "Design requirements and limitations of a single-reading heat stress meter." *Am. Ind. Hyg. Assoc. J.* **34**: 66-72 (1973). J19,382/73

Pikus, V. G., Korotich, A. F., Batrakov, V. N.: "Instrument for investigating the parameters of human attention." *Med. Tekh.* No. 3: 53-55 (1973) (Russian). In English translation: *Biomed. Eng. (N.Y.)* **7** No. 3: 185-187 (1974). J18,102/73

Description of an instrument which, "in addition to automation of the process of investigation, objective recording of the results obtained, and possibility of investigation both under sparing conditions (without distracting external stimuli) and under conditions of graduated noises, also permits studying the parameters of human attention in a state of emotional stress." During investigation, the introduction of various noises allows determination of the stability of the subjects' attention. "This test is used widely in psycho-

physiological selection of railroad engineers, pilots, and cosmonauts."

Fraser, B. A., Buck, L., McKendry, J. B. R.: "Psychomotor performance during insulin-induced hypoglycemia." *Can. Med. Assoc. J.* **110**: 513-518 (1974).

H82,550/74

In man, hypoglycemia-producing doses of insulin impair performance on the stressalyzer (subject-paced, step-input, pursuit-tracking tasks). The authors state that "in the numerous reports concerning effects of stress on performance of tasks requiring psychomotor ability it is evident that stress situations usually result in deterioration in the quality of performance. In this study the stress applied was insulin-induced lowering of the plasma glucose. In seven of eight subjects in whom reduced plasma glucose was temporally correlated with signs and symptoms suggesting hypoglycemia, speed of performance on the stressalyzer deteriorated concomitantly owing principally to increased movement times and to a lesser extent to increased reaction times."

Other Stress Tests. Chalke, F. R. C.: "The Harrower Stress Tolerance Test." *Psychosom. Med.* **8**: 215-216 (1946).

B26,505/46

Validation experiments indicate the value of the *HSTT* in screening persons susceptible to specific disturbing situations and in differentiating normal subjects from neurotics.

Weller, E.: "Über den 'Operations-Stress,' seine Diagnostik und Prophylaxe. Eine Untersuchung mit besonderer Berücksichtigung des Histamin-Erythem-Testes" (On "operation stress," its diagnosis and prophylaxis. A study with special reference to the *histamine-erythema test*). *Ärztl. Forsch.* **13**: 559-569 (1959). C80,994/59

Observations on patients with stress induced by anesthesia and surgery indicated that "the histamine sensitivity of the skin, the individual histamine index, shows a reciprocal ratio to the individual efficiency of the adrenal cortex, and can serve as a gauge for the evaluation of stress-tolerance due to operation."

Arima, J. K.: "Performance of normal males on the *Halstead Tactual Performance Test* under severe environmental stress." *Percept. Mot. Skills* **21**: 83-90 (1965).

J23,599/65

Erickson, J. M., Pugh, W. M., Gunderson,

E. K. E.: "Status congruency as a predictor of job satisfaction and life stress." *J. Appl. Psychol.* **56**: 523-525 (1972). J10,599/72

Description of a "*status congruency*" test to measure the extent to which an individual's occupation and reward coincide with that of his peers. Deviation from such congruency can to some extent predict job satisfaction and life stress.

Schneider, R. A.: "Newer insights into the role and modifications of olfaction in man through clinical studies." *Ann. N.Y. Acad. Sci.* **237**: 217-223 (1974). H93,890/74

Perception and adaptation to an odor (*olfactometer test*) can be used as an indicator of stress caused by daily life events. In a group of women, "those who failed to adapt (or rarely did) had the greatest incidence of stress on the day of the test or the day preceding. The correlation was significant but

was unrelated either to initial threshold level or to nasal mucous membrane function. It would seem appropriate, in the biological sense, that adaptation be inhibited under circumstances of stress if odors are capable of initiating the 'alarm reaction' of Selye."

Hartley, L. R., Adams, R. G.: "Effect of noise on the Stroop test." *J. Exp. Psychol.* **102**: 62-66 (1974). J17,211/74

In the *Stroop color interference test*, "color names written in inks of different hues, excluding ink of the hue the name indicates, are presented to Ss who are required to name the hue of the ink and not the color name." Brief exposure to noise is beneficial, whereas prolonged exposure to intense noise damages performance, in that elimination of the irrelevant interfering feature (color name) is more difficult during stress.

Body Temperature

Stress, especially if it is severe, characteristically interferes with the regulation of body temperature. Curiously, the direction of the change produced largely depends upon the species. Thus, for example, it has long been known that in man a great variety of infections, intoxications and injuries tend to elicit fever, whereas in the rat, even the first observations on the alarm reaction revealed an almost constant occurrence of hypothermia during acute stress caused by virtually any agent.

It is also common knowledge that even in man, severe stress, especially if conducive to shock, induces heat loss that must be countered by keeping the patient covered in warm surroundings.

Some psychoneurotic individuals are predisposed to "stress-hyperthermia" which has been ascribed to a cortico-hypothalamic imbalance.

Several investigators have tried to determine the relative role of decreased heat production and increased heat loss during severe stress conducive to hypothermia, but this problem has not been definitely solved; the relative importance of the two factors probably varies depending upon circumstances.

Body Temperature

(See also our earlier stress monographs, p. xiii)

Selye, H.: "Studies on adaptation." *Endocrinology* **21**: 169-188 (1937). 38,798/37

First detailed description of the alarm reaction to stressors mentioning an initial drop in body temperature as one of the characteristic changes.

Goodell, H., Graham, D. T., Wolff, H. G.: "Changes in body heat regulation associated with varying life situations and emotional states." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 418-432. Baltimore: Williams & Wilkins, 1950.

B51,917/50

Friedman, M.: "Hyperthermia as a manifestation of stress." In: Wolff, H. G., Wolf,

S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 433-444. Baltimore: Williams & Wilkins, 1950. B51,918/50

"Approximately 45 per cent of psychoneurotic individuals exhibiting somatic reference of their disorder exhibit the phenomenon of neurogenic hyperthermia, as defined." This stress hyperthermia is ascribed to "cortico-hypothalamic imbalance."

Bartlett, R. G. Jr., Bohr, V. C., Helmenstine, R. H., Foster, G. L., Miller, M. A.: "Evidence of an emotional factor in hypothermia produced by restraint." *Am. J. Physiol.* **179**: 343-346 (1954).

J25,354/54

Brodie, D. A., Valitski, L. S.: "Production of gastric hemorrhage in rats by multiple stresses." *Proc. Soc. Exp. Biol. Med.* **113**: 998-1001 (1963). E28,039/63

"Gastric hemorrhage was produced in 93% of rats subjected to cold + restraint stress for 60 minutes." This combination of stressors also elicited a marked depression of body temperature lasting three hours after the stress. "Anticholinergics, ganglionic blocking agents, certain central nervous system depressants and epinephrine reduced the incidence of hemorrhage."

Foss, C. R., Horvath, S. M.: "Reactions of wild and albino mice in response to forced swimming." *Proc. Soc. Exp. Biol. Med.* **120**: 588-592 (1965). F59,402/65

The ability of wild and domestic albino mice to swim until exhaustion was much shorter in water of 20°C than at 37°C. The drop in colonic temperature was an excellent indication of exhaustion in temperatures of 28°C or less but remained normal or even rose at higher temperatures. There was no significant difference in either colonic temperature or endurance between the two strains.

Strydom, N. B., Wyndham, C. H., Williams, C. G., Morrison, J. F., Bredell, G. A. G., Joffe, A.: "Oral/rectal temperature differences during work and heat stress." *J. Appl. Physiol.* **20**: 283-287 (1965).

G27,148/65

Studies on the relationship of the BMR to oral and rectal temperatures under different conditions. [Despite the title, the authors made no effort to show a relationship to stress, and presumably studied the specific effects of work at different temperatures (H.S.).]

Wyndham, C. H., Williams, C. G., Morrison, J. F., Bredell, G. A. G.: "A comparison of multi-stress tests on the sweat rate/rectal temperature relationship." *Int. Z. Angew. Physiol.* **23**: 305-321 (1967). G45,958/67

Fiorica, V., Higgins, E. A., Iampietro, P. F., Lategola, M. T., Davis, A. W.: "Physiological responses of men during sleep deprivation." *J. Appl. Physiol.* **24**: 167-176 (1968). G55,182/68

Metabolic studies on resistance to cold in man after eighty-four to eighty-six hours of sleep deprivation showed no very constant and significant deviations from the norm.

Yokoi, Y.: "Effect of heat and cold stress on thermal responses to antipyretic drugs." *Fed. Proc.* **28**: 1115-1117 (1969).

H13,183/69

Prioux-Guyonneau, M.: "Répercussions de la contrainte sur la régulation thermique du rat blanc maintenu à différentes températures ambiantes" (Repercussions of restraint on thermal regulation of white rats kept at different environmental temperatures). *C.R. Soc. Biol. (Paris)* **164**: 72-75 (1970).

J21,917/70

Adams, T., Morgan, M. L., Hunter, W. S., Holmes, K. R.: "Temperature regulation of the unanesthetized cat during mild cold and severe heat stress." *J. Appl. Physiol.* **29**: 852-858 (1970) (24 refs.). G80,331/70

Harris, D. A., Hale, H. B., Hartman, B. O., Martinez, J. A.: "Oral temperature in relation to inflight work/rest schedules." *Aerospace Med.* **41**: 723-727 (1970). G83,677/70

Hagberg, B.: "Emotionally released hyperthermia in cerebral palsy." *Neuropaediatrica* **1**: 295-306 (1970).

J21,364/70

Oyama, J., Platt, W. T., Holland, V. B.: "Deep-body temperature changes in rats exposed to chronic centrifugation." *Am. J. Physiol.* **221**: 1271-1277 (1971).

J19,653/71

In rats, the stressor effect of centrifugation causes a rapid fall in deep-body temperature monitored continuously by implant biotelemetry.

Yordanova, L., Gotsev, T.: "Alterations in the enzyme activity of students with increased body temperature during examinations." *J. Physiol. (Paris)* **63**: 463-464 (1971).

J20,215/71

Among students under "examination stress," the most outstanding objective

changes were tachycardia, hypertension, dilatation of the pupils, increased intraocular pressure, sweating, alterations in erythrocytes and platelets, a rise in body temperature and in the blood levels of carbonic anhydrase and cholinesterase.

Oyama, J., Chan, L.: "Oxygen consumption and carbon dioxide production in rats during acute centrifugation stress and after adaptation to chronic centrifugation." *Fed. Proc.* **32**: 392 (1973). H67,544/73

In rats, stress produced by continuous centrifugation causes a pronounced hypothermia and a decrease in the BMR. However, upon

continued exposure to the stressor, the BMR rises above normal when adaptation occurs. The authors "conclude that the principal factor responsible for the centrifugation stress-induced hypothermia in rats is a decrease in their rate of heat production."

Wells, C. L., Horvath, S. M.: "Heat stress responses related to the menstrual cycle." *J. Appl. Physiol.* **35**: 1-5 (1973). J4,516/73

The few differences occurring during the menstrual cycle phase had a minimal influence upon the ability of normal women "to regulate body temperature when exposed to environmental heat stress."

Cardiovascular System, including Blood Pressure, ECG

The cardiovascular system is particularly sensitive to stress although the intensity and quality of its response is highly dependent upon special conditioning circumstances. Thus, stress is usually associated with a rise in blood pressure and pulse rate, but in severe stress conducive to shock, blood pressure characteristically falls and the heart rate may be decreased. Similarly, whether a stressor causes vasoconstriction or vasodilatation depends upon circumstances.

After hypophysectomy or adrenalectomy, virtually any type of stress induces hypotension. Hence, it may be assumed that pituitary and adrenal hormones play an important role in conditioning the response of the cardiovascular system. Many of the early animal experiments on the mechanism through which stressors, corticoids and catecholamines influence vascular responses during systemic stress were performed on the mesoappendix vessels of the rat. This work confirmed that both adrenalectomy and stress diminish the responsiveness of the vessels to the topical application of NEP, and it has been suggested that the beneficial effect of corticoids in stress is largely due to the restoration of normal vascular contractility. Glucocorticoids even act topically in sensitizing small splanchnic vessels to NEP after adrenalectomy in the rat.

As we shall see later in the section on Diseases of Adaptation, various stressors can produce hypertension and different types of cardiac arrhythmias in both man and experimental animals.

In man, psychogenic stress often causes an increase in forearm blood flow.

Cardiovascular System, including Blood Pressure, ECG

(See also our earlier stress monographs, p. xiii, and cf. ECG under Stress Tests)

Morris, D. P.: "Blood pressure and pulse changes in normal individuals under emotional stress; their relationship to emotional

instability." *Psychosom. Med.* **3**: 389-398 (1941). B26,186/41

In student nurses undergoing examinations and student pilots performing various flying exercises for the first time, a rise in blood pressure was quite constant, but the pulse rate was more variable and sometimes actually decreased. Pallor, tremor, flushing, excessive sweating, restlessness and apprehensive

facial expression were also studied as possible indicators of stress, but the results proved more difficult to interpret.

Fritz, I., Levine, R.: "Action of adrenal cortical steroids and nor-epinephrine on vascular responses of adrenalectomized rats." *Am. J. Physiol.* **163**: 713 (1950).

B54,186/50

By use of the mesoappendix preparation of the rat, it is shown that vasoconstriction following topical application of NEP is impaired by formaldehyde-induced stress, especially after adrenalectomy, but can be restored by topical application of adrenocortical extract. These and other experiments support the concept that corticoids are necessary for the normal response of small vessels to vasoconstrictors.

Fritz, I., Levine, R.: "Action of adrenal cortical steroids and nor-epinephrine on vascular responses of stress in adrenalectomized rats." *Am. J. Physiol.* **165**: 456-465 (1951).

B58,944/51

In adrenalectomized rats the blood vessels of the mesoappendix become refractory to topical application of NEP. Stress induced by subcutaneous formaldehyde does not impair circulation in the mesoappendix of the normal rat, but it does cause sluggishness of flow and eventually stasis prior to death after adrenalectomy. These changes can be prevented by Dibenamine, which also prolongs the survival time after formaldehyde treatment of adrenalectomized rats. Apparently, corticoids are necessary to permit the blood vessels to respond normally to NEP, and at the same time they protect against toxic amounts of NEP.

Kuhl, W. J. Jr., Ralli, E. P.: "Effect of acute stress upon blood constituents, white cells, and urine constituents in normal individuals." *Proc. Assoc. for the Study of Internal Secretions—33rd. Meeting*, p. 51. Atlantic City, N.J., 1951. Also in: *J. Clin. Endocrinol. Metab.* **11**: 776 (1951).

B58,505/51

Normal men immersed in cold water (9.5°C) for eight minutes showed: "1—A decrease in temperature (immediate, 1 and 2 hours); 2—An increase in systolic and diastolic blood pressure (immediate) and a decrease (2 hours); 3—A decrease in heart rate (1, 2, and 4 hours); 4—An increase in neutrophiles (immediate); 5—A decrease in lymphocytes (2 hours); 6—A decrease in eosinophiles (2 hours); 7—A decrease in serum

chloride (immediate); 8—An increase in total proteins (immediate and 4 hours); 9—A decrease in serum water (immediate); 10—An increase in total cholesterol (4 hours); 11—An increase in the urine uric acid/creatinine ratio (2 and 4 hours)." All of these changes were significant and ascribed to stress, but no one indicator gave uniformly positive results.

Ramey, E. R., Goldstein, M. S., Fritz, I., Levine, R.: "Relation of nor-epinephrine and other autonomic agents to vascular collapse of stressed adrenalectomized animal." *Fed. Proc.* **10**: 108 (1951). B57,125/51

In dogs, adrenalectomy decreases the pressor response to NEP. This cannot be corrected by DOC, but adrenocortical extract largely restores normal responsiveness. Glucocorticoids can even act topically in sensitizing small splanchnic vessels to NEP.

Levine, R., Goldstein, M. S., Ramey, E. R., Fritz, I.: "Studies on the mode of action of cortisone in stress situations." *Bull. N. Eng. Med. Cent.* **13**: 114-120 (1951).

B65,214/51

Studies on the Chambers-Zweifach mesoappendix preparation suggest that the beneficial effect of adrenocortical extract in stress is due largely to restoration of normal vascular contractility.

Bernreiter, M.: "Cardiac arrhythmias in physical or emotional stress." *Mo. Med.* **53**: 19-20 (1956). C11,328/56

Case reports showing that violent arguments with superiors, witnessing a serious car accident, or lifting a heavy weight may cause ventricular or paroxysmal auricular tachycardia, complete heart block and even death. It is concluded that "physical exertion and emotional stress may lead to almost all types of cardiac arrhythmias and death in the abnormal as well as the normal heart. An attempt is made to describe some of these phenomena that occur during the alarm reaction and their possible relationship to the production of ectopic rhythms."

Muscular System

[See also Bruxism, and Muscular Function under Stress Tests]

The behavior of the muscular system during stress was studied mainly in connection with the rigidity and tension developing in striated muscles under the influence of psychogenic stressors. This includes bruxism, hyperkinesia (in the form of a tendency to move about without any particular destination), violent gesticulation and even painful muscular cramps.

Muscular hyperactivity can be objectively demonstrated by the EMG and occasionally has been used as a stress test.

Since very little is known about structural changes in the musculature during stress, the few observations along these lines are arbitrarily included in this section otherwise devoted to function.

Blood Coagulation

The earliest experiments of Cannon showed that fear, rage, asphyxia and pain cause a discharge of EP, and like the injection of EP itself, they accelerate blood coagulation.

Since that time, much work has been done to explore the effect of stress upon the blood clotting mechanism. Undoubtedly, stress can enhance blood coagulation and this effect is usually held responsible for stress-induced coronary thromboses. However, fibrinolysis is also accelerated after surgery or even by anxiety during the preoperative period. An increased fibrinolytic activity has also been observed in human blood after stressful muscular exercise, emotional arousal or exposure to heat.

In rabbits, a curious syndrome of "hemorrhagic death" occurs with application of stressors following treatment with indirect anticoagulants (dicumarol, phenylindandione) but not after treatment with heparin. In themselves, alleged stressors (electric shocks, high-pitched sound) cause no change in the coagulation system of the rabbit, although they do increase prothrombin time in rats.

In a large group of accountants, an acceleration of blood clotting consistently occurred at the time of maximum occupational stress, that is, when tax reports became due.

In man, various surgical operations and other traumatic injuries enhance thrombocyte aggregation; this may be another factor predisposing to thromboembolism or disseminated intravascular coagulation. The stress-induced increase in FFA may also play a role in this response. However, hyperventilation and some other stressors allegedly cause a decrease in platelet aggregation.

ADP-induced platelet aggregation in rats was markedly delayed during the first hours after scalds, concurrently with a transient appearance of a plasma inhibitor. Such changes may contribute to the hypercoagulability that is characteristic of burned or traumatized patients.

Some systematic studies have dealt with the effect of stress upon individual blood coagulation factors but these data are too complex to be discussed here and will have to be looked up in the original literature.

Blood Coagulation

(See also our earlier stress monographs, p. xiii)

35,529/11

Cannon, W. B.: "The emergency function of the adrenal medulla in pain and the major emotions." *Am. J. Physiol.* **33**: 356-372 (1914).
57,873/14

Review on the earliest animal experiments showing that fear, rage, asphyxia and pain cause a discharge of EP from the adrenal medulla, and that this response is mediated through the splanchnic nerves. Direct stimulation of the latter exerts the same effect. The resulting glycogenolysis and increase in blood sugar furnish energy. At the same time, blood circulation is improved. Stimulation of the splanchnics also hastens blood coagulation and thereby protects against bleeding in the event of injury. All these changes are "directly serviceable in making the organism more efficient in the struggle which fear or rage or pain may involve."

Macfarlane, R. G., Biggs, R.: "Observations on fibrinolysis. Spontaneous activity associated with surgical operations, trauma, &c." *Lancet* December 14, 1946, pp. 862-864.
B26,947/46

In man, fibrinolysis occurs not only after surgery but even during the preoperative period, presumably under the influence of anxiety and drug treatment. "The activation of the proteolytic system of normal blood, almost certainly responsible for the phenomenon of fibrinolysis, may be a part of the 'alarm reaction' of Selye."

Latner, A. L.: "Anxiety as a cause of fibrinolysis." *Lancet* February 1, 1947, pp. 194-195.
B26,725/47

Various stressors, particularly anxiety, anesthesia and surgery, increase the fibrinolysin content of the blood and produce fibrinolysis.

Schneider, R. A.: "The relation of stress to clotting time, relative viscosity and certain other biophysical alterations of the blood in

the normotensive and hypertensive subject." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 818-831. Baltimore: Williams & Wilkins, 1950.

B51,946/50

Review of the literature on the shortening of blood clotting time and the associated biophysical alterations caused by physical exercise or stress interviews. These changes occur in normotensive people only when pressor responses are manifest during stress and appear to be related to the rise in blood pressure. Normally, this response is useful in that it shortens bleeding from wounds sustained in combat, but in hypertensive subjects it may predispose to coronary or cerebral thromboses.

Schneider, R. A., Zangari, V. M.: "Variations in clotting time, relative viscosity, and other physicochemical properties of the blood accompanying physical and emotional stress in the normotensive and hypertensive subject." *Psychosom. Med.* **13**: 290-303 (1951).

B62,983/51

Review of the blood clotting changes induced in normotensive and hypertensive individuals by various stressors (30 refs.).

Dreyfuss, F.: "Coagulation time of the blood, level of blood eosinophils and thrombocytes under emotional stress." *J. Psychosom. Res.* **1**: 252-257 (1956). C26,923/56

In medical students during final examinations, eosinopenia and accelerated blood clotting were not accompanied by significant variations in the platelet count.

Jaques, L. B., Mogenson, G. J., Fisher, L. M.: "The relation of stress to hemorrhage and prothrombin time following anticoagulants." *Trans. R. Soc. Can.* **50** Sect. V: 9-16 (1956).
C28,187/56

In rabbits a high incidence of hemorrhagic death occurs after exposure to stressors together with indirect anticoagulants (dicumarol, phenindione) but not after treatment with heparin. In themselves, stressors (electric stimulation, high-pitched sound) cause no change in the coagulation system of the rabbit, but they do increase prothrombin time in rats.

Friedman, M., Rosenman, R. H., Carroll,

V.: "Changes in the serum cholesterol and blood clotting time in men subjected to cyclic variation of occupational stress." *Circulation* **17**: 852-861 (1958).

C56,083/58

In a large group of accountants, "each subject's highest serum cholesterol consistently occurred during severe occupational or other stress, and his lowest at times of minimal stress. The results could not be ascribed to any changes of weight, exercise, or diet. Marked acceleration of blood clotting time consistently occurred at the time of maximum occupational stress, in contrast to normal blood clotting during periods of respite."

Friedman, M., Uhley, H. N.: "Role of the adrenal in hastening blood coagulation after exposure to stress." *Am. J. Physiol.* **197**: 205-206 (1959). C71,261/59

In rats, repeated electroshocks caused depletion of adrenal cholesterol and acceleration of blood clotting time. The latter was not affected by adrenalectomy.

Sawyer, W. D., Fletcher, A. P., Alkjaersig, N., Sherry, S.: "Studies on the thrombolytic activity of human plasma." *J. Clin. Invest.* **39**: 426-434 (1960). J11,002/60

In man, such stressors as muscular exercise or emotional arousal enhance thrombolytic activity.

Ogston, D., McDonald, G. A., Fullerton, H. W.: "The influence of anxiety in tests of blood coagulability and fibrinolytic activity." *Lancet* September 15, 1962, pp. 521-523. D32,583/62

In man, minor degrees of anxiety decreased recalcified-plasma clotting time and increased fibrinolytic activities.

Bedrak, E., Beer, G., Furman, K. I.: "Fibrinolytic activity and heat stress." *Isr. J. Exp. Med.* **11**: 1-6 (1963). G9,119/63

"Single acute exposures of normal resting men to environmental heat stress without physical activity caused increased fibrinolytic activity in both whole blood and plasma systems. With more prolonged heat stress exposures, proportionately greater activity was observed in the whole blood system." The literature on fibrinolytic activity after application of various stressors is reviewed.

In dogs, postmortem loss of fibrinogen is normal, but antemortem stress involving little or no tissue trauma may cause postmortem coagulation of the blood.

Fessel, W. J.: "Dextran turbidity: acute distress-phase reaction." *Nature* **205**: 771-773 (1965). F32,709/65

Among patients treated for various types of psychogenic stress, heavy turbidity in the plasma occurs after additional dextran therapy. This response can also be induced experimentally by exposing subjects to stressful mental experiences. "The presence of so much fibrinogen in the precipitate suggests the possibility that the increased levels of dextran turbidity in mental disease and emotional stress result from activation of various serum enzyme systems which cause changes in the internal structure of blood proteins. Plasmin, which affects the fibrinogen molecule, is activated by various agents including emotional stress, physical stress, adrenal steroids, adrenaline, acetylcholine and histamine, and some evidence suggests that plasmin may be under reflex control. Other serum enzymes are also activated by stress, which is known to influence a variety of blood proteins" (20 refs.).

Latour, J. G., Renaud, S.: "Blood platelet fluctuation consecutive to trauma and surgical intervention in the rat, a possible stress effect." *Can. J. Physiol. Pharmacol.* **44**: 581-588 (1966). F68,011/66

It has repeatedly been observed in man that, following surgical interventions, thrombocytopenia occurs during the first two days and thrombocytosis after five to eight days. These changes have now been reproduced in the rat by various stressors, and are therefore ascribed to stress itself.

Engquist, A., Winther, O.: "Variations of plasma cortisol and blood fibrinolytic activity during anaesthetic and surgical stress." *Br. J. Anaesth.* **44**: 1291-1297 (1972).

J672/72

In man, during thirty to ninety-three minutes of "surgical stress, enhancement of fibrinolysis was significantly correlated with an increase of plasma cortisol levels."

Ruxin, R. L., Bidder, T. G., Agle, D. P.: "The influence of autonomic arousal on blood clotting time in patients receiving electroconvulsive treatments." *J. Psychosom. Res.* **16**: 185-192 (1972). J19,669/72

In patients, electroconvulsive treatments raised plasma FFA, but the observations "do not support previous reports demonstrating a direct relationship between arousal and decreased clotting time. Furthermore, they provide no evidence for the hypothesis that emotional factors may influence the pathogenesis of vascular disease or play a part in hemostasis during stress through changes in blood coagulability" (37 refs.).

Zwiener, U., Hindersin, P.: "Die Wirkung von Schmerzreizen auf die Fibrinolyse- und Gerinnungsaktivität postoperativ und bei erhöhter immunologischer Abwehrlage" (The effect of pain on fibrinolysis and coagulation activity after surgery and during increased immunologic defense reactions). *Folia Haematol. (Leipz.)* **98**: 330-337 (1972).

J7,670/72

It is now well established that the most diverse stressors can influence fibrinolytic activity. In rabbits exposed to surgery, "psychic factors of stress only cause inconstant, weak and short-time increases of fibrinolysis as in healthy animals, however they seem to

be able to induce a total plasmalysis when an increased postoperative tendency for fibrinolysis exists. Even increased immunological defense reactions are connected with a significantly higher tendency of fibrinolysis without total plasmalysis occurring here after pain stimulation."

Larcan, A., Stoltz, J. F., Voiry, A. M., Streiff, F.: "Modifications of the electric charge of platelets during various medical stresses." *Acta Univ. Carol. [Med. Monogr.] (Praha)* **53-54**: 455-459 (1972).

H86,544/72

"The electrophoretic mobility of platelets during certain stresses (infarction, arterial thrombosis, endotoxic shock, acute hemolysis) is markedly decreased."

Zwiener, U., Hindersin, P.: "Zur Dynamik von Veränderungen in der fibrinolytischen Plasmaaktivität nach Schmerzreizung" (Painful stimuli causing changes in the fibrinolytic activity of plasma). *Folia Haematol. (Leipz.)* **98**: 322-329 (1972).

H79,337/72

In rabbits, strong painful stimuli often cause acute short-term increases in fibrinolytic activity, with a subsequent drop below the initial values. Similar changes have previously been noted after exposure to other stressors (37 refs.).

Lasierra, J., Ferreira, I. J., Mostacero, C., Viladés, E.: "Changes in platelet aggregation during voluntary hyperventilation." *Rev. Esp. Fisiol.* **28**: 255-259 (1972).

H79,324/72

During respiratory alkalosis induced by voluntary hyperventilation in man, there is a decrease of platelet aggregation. Since various stressors, including anxiety, exert similar effects, the authors "are tempted to see in the decrease of platelet aggregation during respiratory alkalosis a physiological and defence response... [which] ...may be considered as a way to protect somehow the subject from the risk of thrombosis."

Rompel, K., Pfeiffer, H., Höbel, W., Heene, D. L.: "Gerinnungsveränderungen nach akuten apoplektischen Insulten" (Coagulation changes after acute apoplectic strokes). *Med. Klin.* **68**: 1729-1732 (1973).

H81,159/73

After acute apoplectic strokes, the resulting "hyperfibrinogenemia is possibly caused by the unspecific stress situation."

Stremmel, W.: "Stressinduzierte Stoffwechselveränderungen und gesteigerte Throm-

bozyten-Aggregation nach Operationen und Traumen" (Stress-induced metabolic changes and enhanced thrombocyte aggregation after surgery and trauma). *Münch. Med. Wochenschr.* **115**: 416-421 (1973). H68,723/73

In man, various surgical operations and other traumatic injuries enhance thrombocyte aggregation and may cause postoperative thromboembolism or disseminated intravascular coagulation. The stress-induced increase in FFA may play a role in this response (40 refs.).

Uzhanskii, I. G.: "Stress and hemolysis." *Probl. Gemat. Pereliv. Krovi* **18** No. 11: 13-15 (1973) (Russian). J24,004/73

Haft, J. I., Fani, K.: "Intravascular platelet aggregation in the heart induced by stress." *Circulation* **47**: 353-358 (1973). G99,534/73

In rats, immersion in cold water causes platelet aggregation in myocardial vessels, as shown by EM. "It is concluded that stress, probably via catecholamine secretion that enhances platelet stickiness, can induce intravascular platelet aggregation. It is possible that this mechanism plays a part in the relationship between stress and acute clinical myocardial infarction."

Chernigovskaya, S. V., Cherkovich, G. M., Uzunyan, L. A.: "Effect of emotional stress on blood-clotting system indices in monkeys." *Bull. Éksp. Biol. Med.* **75** No. 3: 29-32 (1973) (Russian). Engl. trans.: *Bull. Exp. Biol. Med.* **75**: 250-253 (1973).

H92,268/73

"Prolonged emotional stress causes a marked rise in the blood fibrinogen level of healthy monkeys and of monkeys fed for a long time (3 years) with cholesterol."

Gordon, J. L., Bowyer, D. E., Evans, D. W., Hutchinson, M. J.: "Human platelet reactivity during stressful diagnostic procedures." *J. Clin. Pathol.* **26**: 958-962 (1973). H83,536/73

In conscious patients, cardiac catheterization and other stressful procedures caused a rise in the platelet aggregation response to ADP, with a concurrent increase in plasma FFA. "It is suggested that catecholamines released due to emotional stress may be responsible for the increased platelet responses to ADP and that this could influence the development of thrombosis and atherosclerosis."

Landaburu, R. H., Castellanos, D. E.: "Further evidence for a humoral control of

factor VIII plasma levels." *Thromb. Diath. Haemorrh.* **30**: 460-470 (1973).

H85,654/73

Review of the literature and personal observations on the effect in various species of stressors and EP upon blood clotting, and particularly the factor VIII plasma level.

Jaques, L. B.: "Spontaneous hemorrhage and stress." *Clin. Sci.* **10**: 171-187 (1973).

H82,949/73

In rabbits, commonly employed doses of phenindione and other anticoagulants produced no sign of hemorrhage, and the same was true of a number of stressors (insulin, hypertonic sodium chloride, nervous stimuli and so on) when given alone. However, when the anticoagulants were administered after the stressors, extensive hemorrhages and mortality developed. This "hemorrhage syndrome meets Selye's major criterion for stress, namely 'nonspecificity.'" In fact, the author states that this "hemorrhage syndrome was found by us to provide a quantitative objective assessment of severe stress in animals" (15 refs.).

Maass, B., Jacobi, E., Esser, G.: "Thrombozytenadhäsivität unter Lärmeinwirkung" (Noise affecting thrombocyte adhesiveness). *Dtsch. Med. Wochenschr.* **98**: 2153-2155 (1973).

H78,870/73

Various forms of auditory stress increase thrombocyte adhesiveness and thereby may predispose to thrombosis in man (27 refs.).

Metze, R., Linke, P.-G., Hoffmann, H.-D.: "Veränderungen des Blutgerinnungssystems bei Belastung" (Changes in blood coagulation under stress). *Med. Sport* **13**: 284-289 (1973).

J15,365/73

Both physical and psychogenic stressors, which stimulate the sympathetic nervous system, cause an activation of the clotting and fibrinolytic processes in man (38 refs.).

Haft, J. I., Fani, K.: "Stress and the induction of intravascular platelet aggregation in the heart." *Circulation* **48**: 164-169 (1973).

J5,700/73

In rats, NEP and various stressors enhance intravascular platelet aggregation and may thereby predispose to myocardial infarction (36 refs.).

Jacey, M. J., Madden, R. O., Tappan, D. V.: "Hemostatic alterations following severe dysbaric stress." *Aerosp. Med.* **45**: 1062-1066 (1974).

J16,190/74

In rats, "acute decompression stress pro-

duced a transient decrease in clotting time. Circulating platelet population was unchanged during the early phase of recovery from severe decompression but had declined significantly by 2 d post-surfacing and then returned to control levels by the end of the observation period. Associated with the thrombocytopenic episode was a tendency toward platelet aggregation." A significant hyperfibrinogenemia developed on the day after the "dysbaric stress," with subsequent normalization. Alterations in prothrombin time or partial thromboplastin time were not found (24 refs.).

Egan, E. L., Bowie, E. J. W., Kazmier, F. J., Gilchrist, G. S., Woods, J. W., Owen, C. A. Jr.: "Effect of surgical operations on certain tests used to diagnose intravascular coagulation and fibrinolysis." *Mayo Clin. Proc.* **49**: 658-664 (1974) (66 refs.).

H93,315/74

Casellas, E., Smith, L., D'Aoust, B. G.: "Effects of stress on salmonid blood clotting mechanisms" (abstracted). *Physiologist* **17**: 371 (1974). H89,978/74

Ferguson, E. W., Guest, M. M.: "Exercise, physical conditioning, blood coagulation and fibrinolysis." *Thromb. Diath. Haemorrh.* **31**: 63-71 (1974). H87,867/74

In healthy young men, "immediately after exercise, a marked increase in fibrinolytic activity and an acceleration of most clotting assays were observed. After physical conditioning there was a decrease in the level of fibrinolytic activity at rest and after exercise, but the reactivity of the fibrinolytic system, i.e., the percent increase in fibrinolytic activity in response to exercise, was unaltered. Following physical conditioning, the clotting times of certain assays were less accelerated."

Britton, B. J., Hawkey, C., Wood, W. G., Peele, M.: "Stress. A significant factor in venous thrombosis?" *Br. J. Surg.* **61**: 814-820 (1974). H95,489/74

Herman, C. M., Oshima, G., Erdös, E. G.: "The effect of adrenocorticosteroid pretreatment on kinin system and coagulation response to septic shock in the baboon." *J. Lab. Clin. Med.* **84**: 731-739 (1974) (40 refs.).

J18,036/74

Pina-Cabral, J. M., Rodrigues, C.: "Blood catecholamine levels, factor VIII and fibrinolysis after therapeutic electroshock." *Br. J. Haematol.* **28**: 371-380 (1974).

J18,676/74

Observations on patients undergoing therapeutic electroshock "suggest that while catecholamines are probably not responsible for plasminogen activator release during stress, adrenergic mediation of the concomitant increase in factor VIII is highly probable."

Teshima, H., Inoue, S., Ago, Y., Ikemi, Y.: "Plasminic activity and emotional stress." *Psychother. Psychosom.* **23**: 218-228 (1974).

J16,685/74

Angioneurotic or Quincke's edema often occurs immediately after psychogenic stress. This may be related to increased plasmin activity, found in animals following exposure to various stressors or EP.

Eurenius, K., Rothenberg, J.: "Platelet aggregation after thermal injury." *J. Lab. Clin. Med.* **83**: 355-363 (1974).

J10,809/74

As judged by ADP-induced platelet aggregation in rats, platelet function was markedly depressed during the first hours after scalds, with the concurrent transient appearance of a plasma inhibitor. These changes may contribute to the "hypercoagulability" frequently described in burned or traumatized patients (37 refs.).

Letheby, B. A., Davis, R. B., Larsen, A. E.: "The effect of major surgical procedures on plasma and platelet levels of factor XIII." *Thromb. Diath. Haemorrh.* **31**: 20-29 (1974). H87,866/74

Immunology

Some thirty years ago a great deal was written about the "anamnestic reaction" (reaction of recalling, defined as the enhancement of antibody titer) which follows treatment with a variety of stressors or glucocorticoids in previously immunized ani-

mals. It coincides with lymphopenia and may reflect the liberation of antibodies from disintegrating lymphocytes.

Although little subsequent work has been done to clarify the mechanism and the significance of this reaction, a good deal of evidence has been adduced to show that stress does affect a number of immune responses. It appears to increase resistance to passive anaphylaxis but only in the presence of the adrenals or upon glucocorticoid treatment of adrenalectomized animals (for instance, mice).

Various immune reactions (for example, those responsible for skin homograft rejection) are inhibited by stress, presumably owing to the production of immunosuppressive glucocorticoids. However, susceptibility to poliomyelitis virus, murine sarcoma virus, Coxsackie virus, vesicular stomatitis virus and various bacteria is enhanced.

The increased susceptibility of mice to vesicular stomatitis and polio viruses induced by sound stress may be due to a concurrent inhibition of interferon production.

Some observations suggest that the effect of stressors and glucocorticoids upon immune responses is mediated through "suppressor T-cell" activity. In the bones, stress inhibits thymidin incorporation into T-cell and B-cell-mitogen stimulated lymphocytes, and this suppression can be further accentuated by glucocorticoids. However, T-cells, which are directly concerned with cell-mediated immunity, are more readily inhibited by glucocorticoids than are B-cells, which control humoral antibody production. Hence, the immunosuppressive effect of stress and glucocorticoids is probably one of the characteristic consequences of thymic lymphatic involution and lymphopenia which have long been recognized as typical stress effects.

cholera vibrio lipopolysaccharide and psychological stress." *Trans. R. Soc. Trop. Med. Hyg.* **60**: 514-518 (1966). J24,875/66

"The capability of the serum to neutralize the toxicogenicity of the vibrios, in animals under [psychogenic] stress, developed more slowly than in the control group."

Trapani, I. L.: "Altitude, temperature and the immune response." *Fed. Proc.* **25**: 1254-1259 (1966). F69,414/66

Filipp, G.: *Pathogenese und Therapie allergischer Reaktionen. Grundlagenforschung und Klinik* (Pathogenesis and therapy of allergic reactions. Theory and practice), p. 767. Stuttgart: Ferdinand Enke Verlag, 1966.

E6,824/66

Monograph on the pathogenesis of allergic reactions, with several sections on the G.A.S. Stress influences the immune system in various ways, since activation of the hypothalamus-pituitary-adrenocortical axis mobilizes corticoids and catecholamines, causes involution of the thymicolympathic apparatus, and brings about "anamnestic reactions" which reactivate pre-existent immune responses. Furthermore, histamine metabolism is largely dependent upon the above-mentioned stress hormones, and cortisone, as well as catecholamines, has long been shown to affect allergies of various kinds. Presumably, the so-called "nonspecific irritation therapy" (injection of foreign proteins, bacterial polysaccharides, etc.) also plays a role in this respect.

Hill, C. W., Greer, W. E., Felsenfeld, O.: "Psychological stress, early response to foreign protein, and blood cortisol in vervets." *Psychosom. Med.* **29**: 279-283 (1967).

G48,085/67

In vervet monkeys (*Cercopithecus aethiops*) exposed to psychogenic stress (noise, light, handling), serum cortisol levels rose considerably, and antibody formation to bovine serum albumin was diminished and delayed.

Weinmann, C. J., Rothman, A. H.: "Effects of stress upon acquired immunity to the dwarf tapeworm, *Hymenolepis nana*." *Exp. Parasitol.* **21**: 61-67 (1967).

J22,590/67

"Severe and prolonged fighting among male mice hindered development of acquired immunity in stressed animals and increased the reinfection rate in mice with well-established acquired immunity. Stress induced by repeated association with strange mice also

enhanced reinfection rates in immune mice. Severe nutritional stress rendered most immune mice susceptible to reinfection but cold stress did not significantly increase reinfection rates."

Fischer, G.; Dostal, V.: "Einfluss von kältestress auf die Vakzine-Infektion bei Ratten" (Influence of cold-induced stress on vaccinia infections in rats). *Z. Immun. Forsch.* **133**: 313-316 (1967). F87,491/67

In rats, stress induced by cold diminishes the local reaction and increases antibody production after vaccinia infections.

Belfer, M. L.: "Stress-tempered antibiotic response." *N. Engl. J. Med.* **279**: 1002 (1968). J21,992/68

Jensen, M. M.: "Transitory impairment of interferon production in stressed mice." *J. Infect. Dis.* **118**: 230-234 (1968).

G58,629/68

Avoidance learning in a shuttlebox apparatus caused "transitory impairment of interferon production by forms of stress which were mediated primarily through the central nervous system and which were considered comparable to psychological or the nonspecific stress response of Selye." Possibly, excess glucocorticoid production mediates this reaction.

Thaxton, P., Sadler, C. R., Glick, B.: "Immune response of chickens following heat exposure or injections with ACTH." *Poultry Sci.* **47**: 264-266 (1968). G58,548/68

In chickens exposed to heat, treatment with ACTH or cortisone before antigen injection depresses the antibody response to sheep red blood cells. Such treatment also interferes with the development of the bursa of Fabricius and the spleen. This "might be explained by an interference with phagocytosis or immunoglobulin producing cells brought about by direct effect of the treatment or by some humoral substance like corticosterone."

Abeatici, S., Lamarca, S., Canino, V., Sassi, I., Calvi, A.: "Influenza dello stress sulla reazione di rigetto di omotriplanti cutanei (ricerche sperimentali)" (Influence of stress on the rejection reaction of skin transplants [experimental research]). *Chir. Patol. Sper.* **16** Supp. 6: 14-27 (1968). H27,346/68

In rats exposed to the stress of centrifugation, it was shown that under the influence of "the alarm stimulus, the survival of the cutaneous homografts is significantly higher than that observed in the control animals."

Horwitz, K. B., Ball, R. J., Schmidt, J. P.: "Resistance to infection of mice and hamsters following short term acceleration stress." *Aerosp. Med.* **40**: 1248-1251 (1969).

H44,833/69

Brief exposure to acceleration significantly protected mice but not hamsters against subsequent infection with *Clostridium tetani* or *S. typhimurium*. Cortisol secretion was not demonstrable in the stressed mice. It is suggested that the previously documented effect of stress and cortisol in lowering resistance to infection does not occur following very short exposure.

Friedman, S. B., Glasgow, L. A., Ader, R.: "Psychosocial factors modifying host resistance to experimental infections." *Ann. N.Y. Acad. Sci.* **164**: 381-393 (1969).

H19,304/69

Review of the literature and personal observations on the effect of stress upon im-

mune mechanisms, including those against tumorigenic viruses, and the possible participation of interferon in these phenomena (22 refs.).

Solomon, G. F.: "Stress and antibody response in rats." *Int. Arch. Allergy Appl. Immunol.* **35**: 97-104 (1969). G64,541/69

"Overcrowding stress but not the stress of apprehension-electric shock administered for a week prior to immunization with a potent bacterial antigen, flagellin, and continued during the course of observation significantly reduced both primary and secondary antibody response in inbred male rats. The stress of remaining on a small platform (with rapid eye-movement sleep deprivation) or medium sized platform (without REM deprivation) over a pan of water significantly reduced primary but not secondary response" (31 refs.).

Anderlik, P., Bános, Z., Szeri, I., Koltay, M., Virág, I.: "Response to stressors of mice undergoing graft-versus-host reaction." *Experientia* **26**: 94-95 (1970).

H21,168/70

In mice, intravenous injection of homologous splenic cells causes lymphopenia with body weight loss. Following such treatment, these animals no longer respond to a second stressor with further lymphopenia.

Thaxton, P., Siegel, H. S.: "Adrenocortical function and immunodepression in young chickens." *Poultry Sci.* **49**: 1444 (1970).

J11,183/70

The immune titers developed by young chickens following challenge with sheep red blood cells were depressed by exposure to heat or ACTH. This immunodepression could in turn be at least partially blocked by metyrapone, which interferes with corticoid synthesis.

Friedman, S. B., Glasgow, L. A., Ader, R.: "Differential susceptibility to a viral agent in mice housed alone or in groups." *Psychosom. Med.* **32**: 285-299 (1970).

G76,988/70

"In two strains of mice, individually housed animals were more susceptible to encephalomyocarditis (EMC) virus than those housed in groups." Interferon and antibody levels following virus inoculation did not explain the differences in resistance. Corticosterone levels at the peak of the circadian rhythm were higher in individually housed mice.

Kurochkin, V. I.: "Properdin concentration and protein composition of the lymph

and blood in stress." *Biull. Éksp. Biol. Med.* **71**: 12-13 (1971) (Russian). Engl. trans.: *Bull. Exp. Biol. Med.* **71**: 10-11 (1971).

J21,620/71

"After fractures of the tibia and fibula in rabbits the properdin concentration in the lymph draining from the injured limb is reduced, while the total protein concentration is increased. The properdin, total protein, and albumin levels in the blood are lowered under these circumstances."

Portugalov, V. V., Kaplanskii, A. S., Duranova, G. N.: "The condition of immunocompetent organs in the presence of hypokinesia." *Vestn. Akad. Med. Nauk SSSR* **26** No. 10: 29-34 (1971) (Russian). Engl. trans.: *Vestn. USSR Acad. Med. Sci.* **26**: 40-46 (1971). J20,535/71

The thymicolympathic and splenic involution associated with stress (restraint) is accompanied by a decrease in the production of immunocompetent cells, but this paradoxically fails to diminish the antibody content of the blood.

Ermolov, V. I.: "Effects of disturbance of the normal course of pregnancy in dogs on development of natural immunity in the progeny." *Biull. Éksp. Biol. Med.* **71** No. 3: 64-66 (1971) (Russian). Engl. trans.: *Bull. Exp. Biol. Med.* **71** No. 3: 285-287 (1971).

J21,617/71

In dogs exposed to stressors during pregnancy, "the immunologic properties of the blood of the fetuses and newborn puppies were appreciably weakened. The phagocytic response was depressed most sharply, and this was accompanied by a decrease in the digestive power of the leukocytes. Weakening of the immunobiological properties led to the appearance of inflammation in the lungs and intestine by the action of the automicroflora and was responsible for death of a large proportion of the newly born animals."

Olinescu, A., Olinescu, E., Istrate, N., Oprisan, R., Potorac, E.: "Modificari ale răspunsului imun la soareciile de laborator supuși acțiunii factorului stress-ant de transport" (Changes in the immune response of laboratory mice undergoing transport stress). *Microbiologia* (Bucur.) **16**: 417-422 (1971) (Roumanian). J19,887/71

In mice, "transport stress" decreases the titer of antibodies and increases mortality following inoculation with pathogenic organisms.

Noble, G. A.: "Leishmania braziliensis:

physical and chemical stress in hamsters." *Exp. Parasitol.* **29**: 30-32 (1971).

G81,736/71

In hamsters, various stressors, and particularly restraint, significantly diminished resistance to inoculation with *Leishmania braziliensis*.

Gisler, R. H., Bussard, A. E., Mazié, J. C., Hess, R.: "Hormonal regulation of the immune response. I. Induction of an immune response in vitro with lymphoid cells from mice exposed to acute systemic stress." *Cell. Immunol.* **2**: 634-645 (1971).

G88,149/71

Observations on mice exposed to the stressor effect of acceleration or ether anesthesia "showed a close relationship between depletion of small lymphocytes in the peripheral areas of the follicles and in the marginal zones of the spleen and diminished immune reactivity of the corresponding cell suspensions in vitro."

Gisler, R. H., Schenkel-Hulliger, L.: "Hormonal regulation of the immune response. II. Influence of pituitary and adrenal activity on immune responsiveness in vitro." *Cell. Immunol.* **2**: 646-657 (1971).

G88,150/71

In mice, stress (acceleration, ether) or ACTH decreases antigen production by explanted spleen cells *in vitro*. Pretreatment with STH counteracts this effect and accelerates recovery of corticoid-induced depression of immune reactivity (30 refs.).

Cianci, P., Donahoo, S., Minogue, T., Staver, R.: "Stress as a factor in the development of clinical malaria: a comparative study of malarial incidence in RVN casualties." *Milit. Med.* **137**: 113-114 (1972). G89,300/72

In military personnel, malaria often "appeared after the added stress of surgery and anesthesia, including minor procedures."

Mullane, J. F., Wilfong, R. G., LaForce, F. M., Huber, G. L.: "Effect of acute stress on pulmonary host defenses." *Clin. Res.* **20**: 580 (1972). H54,070/72

Zdrodovskii, P. F., Gurvich, G. A.: *Physiologic Basis and Regulation of Immune Reactions*, p. 88. Moskva: Meditsina, 1972 (Russian). E9,933/72

Monograph on the regulation of immunologic mechanisms. The G.A.S. is intimately involved in the first anamnestic reactions. For example, in rats previously immunized

with paratyphoid, the G.A.S. (produced by cold) first leads to a "passive anamnestic reaction" in which the preformed agglutinins are liberated owing to lysis of plasmocytes in the involuting lymph nodes. Later, during the stage of resistance, there is an "active anamnestic reaction," ascribed to increased synthesis, under the influence of anabolic hormone production, which follows the initial glucocorticoid discharge. Several other experiments are cited in support of the concept that the G.A.S., through the effect of adaptive hormones upon antibody formation, represents an important aspect of immunologic defense, even in the adult organism. On the other hand, it has previously been demonstrated that immunologic challenge can act as a stressor provoking the manifestations of the G.A.S.

Seifter, E., Rettura, G., Zisblatt, M., Levenson, S. M., Levine, N., Davidson, A., Seifter, J.: "Enhancement of tumor development in physically-stressed mice inoculated with an oncogenic virus." *Experientia* **29**: 1379-1382 (1973). H80,975/73

In rats, restraint by a partial body cast produced typical manifestations of systemic stress, and at the same time it increased susceptibility to the tumorigenic action of murine sarcoma virus. In the restrained animals, "there appeared to be a smaller number of small lymphocytes due to stress and a proliferation of epithelioid elements. Hassall bodies were also involved in agreement with earlier findings of Selye. If stress or cortisone treatment results in impaired function of these structures, then the endocrine function of the thymus gland as well as its role in providing circulating cells would be disturbed." In any event, the response of the thymus during stress is assumed to increase susceptibility to the virus through interference with immune reactions.

Amkraut, A. A., Solomon, G. F., Kasper, P., Purdue, A.: "Stress and hormonal intervention in the graft-versus-host response." *Adv. Exp. Med. Biol.* **29**: 667-674 (1973). J24,477/73

The authors quote literature which indicates that stress generally suppresses immune reactions. They then add, "We have shown such suppressive effects on antibody formation and have also reported stress-induced increases in tumor size, which are probably a consequence of immunosuppression."

Gross, W. B., Siegel, P. B.: "Effect of

social stress and steroids on antibody production." *Avian Dis.* **17**: 807-815 (1973). J22,009/73

Stalheim, O. H. V.: "Failure to reproduce acute porcine leptospirosis by physiologic stress or concurrent infections." *Am. J. Vet. Res.* **34**: 1257-1260 (1973). J22,019/73

Jensen, M. M.: "Possible mechanisms of impaired interferon production in stressed mice." *Proc. Soc. Exp. Biol. Med.* **142**: 820-823 (1973). H66,962/73

In mice, avoidance-learning and confinement stress inhibited interferon production following endotoxin injections. "Neither the blocking of alpha adrenergic receptors with phenoxybenzamine nor the antagonism of serotonin with methysergide influenced this response. The spleen did appear to play a role in this response, as no difference in interferon production was seen between stressed and control splenectomized mice."

Ježkova, Z., Petz, R.: "Effect of experimental stress on the immunological response in experimental atherosclerosis in rabbits" (Author's translation). *Čas. Lék. Čes.* **113** (42): 1279-1283 (1974) (Czech). J24,350/74

Brown, K. I., Nestor, K. E.: "Implications of selection for high and low adrenal response to stress." *Poultry Sci.* **53**: 1297-1306 (1974). J21,587/74

In turkeys, exposure to stressors increases susceptibility to viral diseases and resistance to bacterial infections.

Tizard, I. R., Ellicott, D. I.: "Cell-mediated hypersensitivity to *Pasteurella hemolytica* in normal and cold-stressed mice." *Can. J. Comp. Med.* **38**: 44-48 (1974). J21,563/74

Hamid, J., Sayeed, A., McFarlane, H.: "The effect of 1-(o-chlorophenyl)-1-(p-chlorophenyl)-2,2-dichloroethane (o,p'-DDD) on the immune response in malnutrition." *Br. J. Exp. Pathol.* **55**: 94-100 (1974). H86,118/74

In rats, o,p'-DDD caused a loss of body weight as well as involution of the thymus, spleen and adrenals. In malnourished rats the adrenal atrophy was particularly marked and was associated with a diminution of plasma corticoids and a decrease in the impairment of the immune response normally occasioned by this drug.

Folch, H., Waksman, B. H.: "The splenic suppressor cell. I. Activity of thymus-depen-

dent adherent cells: changes with age and stress." *J. Immunol.* **113**: 127-139 (1974).

J13,910/74

Review and personal observations on the effect of various stressors, glucocorticoids, and age upon "suppressor T cell" activity, which may play a decisive part in stress-induced changes of immunologic defense (81 refs.).

Gisler, R. H.: "Stress and the hormonal regulation of the immune response in mice." *Psychother. Psychosom.* **23**: 197-208 (1974).

J16,683/74

In mice, various stressors and ACTH decreased immune reactivity of the spleen cells in vitro, while raising plasma corticosterone levels. "Restraint stress significantly increased the homing of ^{51}Cr -labeled lymph node cells from normal nu/+ mice (B and T cells) to spleen and bone marrow. In contrast, homing of nu/nu lymph node cells (B cells) to lymph nodes and spleen was decreased in stressed recipients, and an increased proportion of cells was found in the liver. Hypophysectomy of cell donors resulted in a persistent depression of immune responsiveness, which was restored by treatment with somatotrophic hormone (STH). STH presumably accelerates recovery from stress-induced immunosuppression. Moreover, exogenous STH interfered with the effect of increased endogenous corticosterone" (43 refs.).

Palmlad, J., Cantell, K., Strander, H., Fröberg, J., Karlsson, C. G., Levi, L.: "Stressor exposure and human interferon production." *Lab. Clin. Stress Res.* (Stockh.) Rep. No. 35: 1-8 (1974).

J17,329/74

In women exposed to a seventy-seven-hour vigil and showing hormonal changes characteristic of stress, the ability of the blood cells to produce interferon following addition of Sendai virus to blood samples rose considerably.

Ahmed, A., Herman, C. M., Knudsen, R. C., Sode, J., Strong, D. M., Sell, K. W.: "Effect of exogenous and endogenous glucocorticosteroids on the in vitro stimulation of lymphocytes from sedated and awake-restrained healthy baboons." *J. Surg. Res.* **16**: 172-182 (1974).

J12,487/74

In baboons the stress of squeeze-cage manipulation and restraint decreases the relative and total blood lymphocyte counts. There is also an associated suppression of methyl- ^3H -thymidine incorporation by unstimulated as

well as by T-cell mitogen- and B-cell mitogen-stimulated lymphocytes. Subsequent injection of methylprednisolone blocks this inhibition of incorporation; however, exogenous corticoids affect the thymus-derived T-cells more than the bursa of Fabricius equivalent B-cells. The T-cells seem to be directly concerned with the cell mediated immunity and the B-cells with the production of humoral antibodies. Hence, the immunosuppressive effect of stress and glucocorticoids is probably one of the characteristic consequences of the thymicolympathic involution and lymphopenia that have been recognized as a typical stress effect since the first formulation of the G.A.S. concept.

Hamilton, D. R.: "Immunosuppressive effects of predator induced stress in mice with acquired immunity to *Hymenolepis nana*." *J. Psychosom. Res.* **18**: 143-150 (1974).

J15,134/74

"Predator stressed groups showed a high level of reinfection, high plasma corticosterone levels, increased adrenal gland weights, and decreased body weight gains in proportion to increasing frequency of exposure" (21 refs.).

Blumöhr, T., Klöcking, R., Sprössig, M.: "Veränderungen der Plasmakreatinkinaseaktivität durch Coxsackievirusinfektion bei Mäusen" (Coxsackie virus infection causing plasma creatine kinase changes in mice). *Pathol. Microbiol.* (Basel) **40**: 241-250 (1974).

H89,273/74

In mice, swimming (allegedly owing to its stressor effect) predisposes to Coxsackie virus infection and raises plasma creatine kinase activity. Causal connections between these changes are suspected but not proven.

Dressler, D. P., Skornik, W. A.: "Pulmonary bacterial susceptibility in the burned rat." *Ann. Surg.* **180**: 221-227 (1974).

J15,111/74

Exposure of burned and control rats to *P. aeruginosa* and *S. aureus* showed that susceptibility to pulmonary infection is greatly increased within twenty-four hours of thermal injury.

Cormane, R. H.: "A molecular explanation of stress dermatitis." *Psychother. Psychosom.* **23**: 188-196 (1974).

J16,682/74

In contact dermatitis, deposition mechanisms of immune complexes are "hastened by release of vasoactive amines and hormones due to psychological reasons, stress, or trauma. As a consequence of the aforemen-

tioned sequence of events, it is understandable that release of sympathomimetic amines and hormones along with the presence of antigen may perpetuate or even worsen cell-mediated immunity."

Solomon, G. F., Amkraut, A. A., Kasper, P.: "Immunity, emotions and stress, with special reference to the mechanisms of stress effects on the immune system." *Psychother. Psychosom.* **23**: 209-217 (1974).

J16,684/74

Review of the literature and experiments on rats suggest that stress and CNS lesions "affect thymus-derived lymphocytes (T-cells) and play a role in cell-cell interaction or the release of mediators from reacting lymphocytes. Ultimately, we may find that stress affects the macrophage, a hormone-sensitive cell that plays a role in afferent, central and efferent limbs of the immune system" (no refs.).

Howard, R. J., Simmons, R. L.: "Acquired immunologic deficiencies after trauma and surgical procedures." *Surg. Gynecol. Obstet.* **139**: 771-782 (1974). H95,043/74

In man, "surgical trauma is associated with a number of temporary deficits in the immune system which might conceivably lead to increased susceptibility to infection or tumor spread" (109 refs.).

Wagner, V., Andrlíková, J., Pálek, V.: "Immunoglobulins under the influence of nonspecific factors. II. The influence of work-stress on levels of immunoglobulins (IgG, IgA, IgM) of miners in uranium mines." *Z. Immunitätsforsch.* **148**: 356-365 (1975). J23,619/75

In miners, prolonged exposure to work stress caused "a significant decrease of all 3 classes of Ig. In the group exposed for a shorter time only the IgG decreased significantly."

Death

Sudden death has been observed repeatedly as a consequence of violent arguments with superiors or the emotional upset of witnessing serious accidents. It is usually ascribed to paroxysmal auricular tachycardia, complete heart block or ventricular fibrillation. However, in addition to painful psychogenic stressors, sudden reunion with long-lost relatives, triumphs, or the happy ending of some event which is particularly meaningful to the patient may also lead to sudden death.

Among primitive tribes in New Zealand and Haiti, death induced by "black magic," especially "voodoo" death, is a well-known phenomenon. Presumably it results from a sudden, particularly intense catecholamine discharge. Among animals, intense overactivity of the parasympathetic nervous system allegedly may cause sudden death.

In cockroaches, fighting can result in the death of the subordinates even without any evidence of physical damage. This has been described as "death from stress."

Some authors believe that even certain cases of "crib death" are due to unpredictable stress reactions.

Death

(See also our earlier stress monographs, p. xiii)

Weiss, S.: "Instantaneous 'physiologic' death." *N. Engl. J. Med.* **223**: 793-797 (1940). B23,665/40

Sudden death may often occur under the influence of an acute stressor in the absence of any detectable morphologic change. It is

considered that in these cases the immediate cause of death is usually fatal syncope with asystole of various types and ventricular fibrillation (20 refs.).

Cannon, W. B.: "'Voodoo' death." *Am. Anthropol.* **44**: 169-181 (1942).

B26,335/42

Death induced by spells, sorcery or "black magic" among primitive tribes, especially

"voodoo" death among the natives of New Zealand and Haiti, is ascribed to sudden extreme fear, probably causing overexcitement of the sympathetico-adrenal medullary system. Many pertinent cases are described and analyzed.

Bernreiter, M.: "Cardiac arrhythmias in physical or emotional stress." *Mo. Med.* **53**: 19-20 (1956). C11,328/56

Case reports showing that violent arguments with superiors, witnessing a serious car accident, or lifting a heavy weight may cause ventricular or paroxysmal auricular tachycardia, complete heart block and even death. It is concluded that "physical exertion and emotional stress may lead to almost all types of cardiac arrhythmias and death in the abnormal as well as the normal heart. An attempt is made to describe some of these phenomena that occur during the alarm reaction and their possible relationship to the production of ectopic rhythms."

Sandberg, A. A., Eik-Nes, K., Migeon, C. J., Samuels, L. T.: "Metabolism of adrenal steroids in dying patients." *J. Clin. Endocrinol. Metab.* **16**: 1001-1016 (1956).

C20,121/56

In agonal patients the plasma clearance of intravenous radiocortisol was delayed, and terminal subjects excreted most of the 17-OHCS in conjugated form. These and other findings are interpreted as indicating that "elevated plasma corticoid levels in dying patients are due to impaired metabolism of these steroids in the presence of continued production and secretion of steroids by the adrenal cortex at normal or reduced rates."

Richter, C. P.: "On the phenomenon of sudden death in animals and man." *Psychosom. Med.* **19**: 191-198 (1957).

J24,112/57

The phenomenon of sudden death has been described in man, rats and many other animals as being due primarily to overactivity of the parasympathetic system, with consequent failure of the heart.

Finkel, I. I., Kovanev, V. A.: "The role of the stress reaction in the postoperative mortality of the patients with acquired cardiac affections." *Arkh. Patol.* **25** No. 5: 19-26 (1963) (Russian). G29,660/63

Sudden death during the first three days after an operation, especially among patients with rheumatic cardiac affections, is usually associated with morphologic changes in the endocrine and other internal organs, referred

to by the authors as "nonspecific manifestations of the general adaptational syndrome."

Elkington, A. R., Steele, P. R., Yun, D. D.: "Scared to death?" *Br. Med. J.* August 7, 1965, pp. 363-364. J22,826/65

Report on "an apparently healthy middle-aged woman dying with massive adrenal haemorrhage, following a relatively minor operation, who was subsequently found to have had forebodings of death." The authors suggest that emotional plus traumatic stress may have been the cause of sudden death here.

Ewing, L. S.: "Fighting and death from stress in a cockroach." *Science* **155**: 1035-1036 (1967). J22,668/67

In the cockroach *Nauphoeta cinerea*, fighting may result in death in subordinates without evidence of external damage. "The situation is likened to death from stress as found in mammals."

Bishop, L. F., Reichert, P.: "Emotion and heart failure." *Psychosomatics* **12**: 412-415 (1971). H51,328/71

Stimulating review of the electrolyte and hormonal changes associated with sudden cardiac failure following exposure to psychogenic stressors.

Elkinton, J. R.: "Scared to death?" *Ann. Intern. Med.* **74**: 789-790 (1971). J20,741/71

Porter, A. L., McCarthy, C. D., Pearman, H. E.: "Effect of stressful physical illness on future time perspective." *J. Clin. Psychol.* **27**: 447-448 (1971). J20,216/71

A variety of particularly stressful diseases, and especially myocardial infarction, shorten life expectancy in man.

Engel, G. L.: "Sudden and rapid death during psychological stress. Folklore or folk wisdom?" *Ann. Intern. Med.* **74**: 771-782 (1971). G83,212/71

Excellent and detailed review of the socio-logic-demographic literature shows that the causes of sudden death in man may be classified into eight categories: "1) on the impact of the collapse or death of a close person; 2) during acute grief; 3) on threat of loss of a close person; 4) during mourning or on an anniversary; 5) on loss of status or self-esteem; 6) personal danger or threat of injury; 7) after the danger is over; 8) reunion, triumph, or happy ending" (89 refs.).

Nahum, L. H.: "Emotional stress and sud-

den death." *Conn. Med.* **35**: 558-560 (1971). J20,214/71

Halpern, W. I.: "Some psychiatric sequelae to crib death." *Am. J. Psychiatry* **129**: 398-402 (1972). J19,544/72

Unexplained infant death has not been shown to be related to stress in the usual sense of the word, but it causes unpredictable stress reactions in the mother. When she discovers the dead child, the mother will at times use a young sibling as a scapegoat.

Tejmar, J.: "Berlin wall and sudden death." *Ann. Intern. Med.* **78**: 620 (1973). J19,555/73

Sudden death during joyful meetings after long years of separation has been described, but it is undoubtedly a very rare occurrence.

Lown, B., Verrier, R., Corbalan, R.: "Psychologic stress and threshold for repetitive ventricular response." *Science* **182**: 834-836 (1973). H77,441/73

Psychogenic stressors reduce the threshold of the dog's ventricle for repetitive responses and indicate "electrical instability and a predisposition to ventricular fibrillation, the mechanism of sudden death."

Pruitt, R. D.: "Death as an expression of functional disease." *Mayo Clin. Proc.* **49**: 627-663 (1974). H93,314/74

General review of death, including "Voo-

doo Death" and death from fright (as, for example, among canaries who were exposed to but could not be reached by a leopard), explained by nervous reflexes, especially those regulating heartbeat (excellent bibliography).

Opie, L. H.: "Sudden death and sport." *Lancet* February 1, 1975, pp. 263-266. H98,865/75

"Of 21 sudden deaths in sportsmen, 18 were thought to be caused by heart-attacks either during or after sport." Psychologic factors were considered to be important in eight cases.

Schmidt, R. T.: "Personality and fainting." *J. Psychosom. Res.* **19**: 21-25 (1975). J22,160/75

Vasodepressor fainting often occurs in response to stressful situations in predisposed individuals. It may be precipitated by "a situation, which elicits little emotional response from most people, [but which] can be extremely unpleasant for the fainter. The injury threatened may be minimal, but the related psychic stress is great. Chronic fainters learn to anticipate fainting and avoid precipitating stresses." This differs from hysterical fainting, in which pulse and blood pressure remain normal. "A vasodepressor reaction leads to collapse of the circulatory system, which sometimes resembles shock and has been known to result in death."

Varia

The abstract section contains data on changes in respiration, voice, blood-brain barrier, ultrasonic vocalizations, smell, sweating (for which see also GSR under Stress Tests), handwriting, and drug clearance, among other functional alterations induced by stress.

In man, stressors which reduce *liver* plasma flow (heat, exercise, fluid deprivation) delayed the plasma clearance of drugs normally eliminated by the liver.

Bell, R. W., Nitschke, W., Bell, N. J., Zachman, T. A.: "Early experience, ultrasonic vocalizations, and maternal responsiveness in rats." *Dev. Psychobiol.* **7**: 235-242 (1974). J12,730/74

Exposure of neonatal rats to cold and several other stressors induces *ultrasonic vocalization* and agitation of their mothers. "If the pup is mildly stressed he displays a pattern of ultrasonic signaling which elicits adaptive maternal responsiveness. If the pup is too severely stressed he displays persistent signaling which agitates the mother, preventing an adaptive pattern of behavior, and resulting in a prolonged response to stress in the pup."

IV. DISEASES OF ADAPTATION

Generalities

Soon after the description of the G.A.S., the concept of stress-induced diseases or "diseases of adaptation" was formulated; it appeared then that stress (particularly maladaptation to stress) played a decisive role in a number of maladies. At times these maladies have been referred to as "diseases of our civilization." This is hardly justifiable; stress and demands for adaptation, as well as faulty responses to such demands, have existed since time immemorial, although the stressors of our era are of course very different from those that affected man in prehistoric times or in antiquity.

Diseases of adaptation are essentially always pluricausal or multifactorial. As we pointed out before, no agent alone produces stress without also eliciting specific manifestations of its own and the latter are necessarily superimposed upon the former. Conversely, all pathogens make some nonspecific demands, hence they all produce stress in addition to their specific pathogenic effects, and there is an element of stress in every disease. It is customary, however, to speak of diseases of adaptation only in referring to those maladies in which stress plays the predominant pathogenic role, although its manifestations are modified not only by the specific effects of the pathogen but also by external and internal conditioning factors that determine disease susceptibility.

Among the most important diseases of adaptation in this sense, we shall discuss shock, peptic ulcers, various cardiovascular diseases (particularly hypertension and cardiac infarcts), psychiatric disturbances (including toxicomanias), certain immune diseases and so on. In many of these maladies, inappropriate (excessive or insufficient) corticoid secretion plays an important part.

In the 1950s, it was claimed that "the tissues of the organism with a normal pituitary-adrenal system are never subjected to a plethora of cortical hormones as implied in the 'Diseases of Adaptation' thesis of Selye" because at that time it was thought that the corticoid feedback mechanism worked perfectly even during stress (Sayers). However, it is now generally accepted that a stress-induced excess of corticoids or catecholamines does play a role in the development of many diseases, although this factor may be more or less important within the framework of a given "pathogenic situation" (Ingle, Thorn *et al.*).

During the 1960s, the view gained some momentum, especially in Germany, that stress hormones are not involved in the production of morbid lesions, but that non-specific changes of resistance are due to "vegetative total reorientation," which is in essence a modification of the relative predominance of sympathetic or parasympathetic nervous impulses (Hoff). There can be no doubt that changes in the activity of the ANS also play an important role in diverse stress-induced diseases, but the "vegetative

tonus" is much more difficult to quantify than the hormone level of the blood and urine. The concept of "vegetative total reorientation" proved to be very difficult to substantiate by quantitative observations, and hence much more work has been done on the hormonal than on the nervous components involved in the pathogenesis of stress diseases.

Finally, it should be pointed out that embryonic and immediately postnatal development of diseases of adaptation may also cause permanent malformations and that many of the manifestations of aging are probably the accumulated result of all the maladaptations to stress experienced during a lifetime.

Hoff, F.: "Krankheit und Adaptation" (Disease and adaptation). *Med. Welt* No. 1: 1-10 (1964).

F508/64

Detailed description of a lecture in which stress and the G.A.S. are considered to play no role in the pathogenesis of disease. In particular, the so-called stress hormones are not involved in the production of morbid lesions. Nonspecific changes of resistance are due to "vegetative total reorientation" ("vegetative Gesamtumschaltung"), which is a modification of the relative predominance of sympathetic and parasympathetic nervous impulses as described by the author many years ago. The concept of stress is superfluous, and to a large extent is based merely on linguistic innovations applied to the author's theory of vegetative total reorientation.

H87,100/74

In this Nobel lecture the author points out that, more than half a century ago and without any medical training, F. M. Alexander developed a technique for correcting various somatic and mental disorders by improvement of body posture and avoidance of faulty use of our neuromuscular system. "Misuse, with all its psychosomatic, or rather somatopsychic, consequences must therefore be considered a result of modern living conditions of a culturally determined stress." There is considerable evidence that arthritis, respiratory troubles, asthma, hypertension, gastrointestinal disorders, various gynecologic derangements, sexual failures, migraine, and depression (all diseases not caused by identifiable pathogens), as well as suicide, are actually due to stress. These diseases can be corrected by proper ethologic counseling. "It is stress in the widest sense, the inadequacy of our adjustability, that will become perhaps the most important disruptive influence in our society."

J18,275/74

Shock

Perhaps shock is the most typical stress disease, since it can be produced by virtually any pathogen as long as its effect is sufficiently severe. However, this condition has already been previously discussed in the sections on trauma, hemorrhage, and various intoxications (Chapter II), all of which can elicit shock.

Shock

(See also our earlier stress monographs, p. xiii)

Wiggers, C. J.: *Physiology of Shock*, p. 459. Cambridge, Mass.: Harvard University Press, 1950. B68,707/50

Technical treatise on shock, with a few pages on its relationship to the alarm reaction.

Levij, I. S., Fuente, A. A. de la: "A post-mortem study of gastric and duodenal peptic lesions. Part I. Frequency and distribution by age and sex. Part II. Correlations with other pathological conditions." *Gut* 4: 349-359 (1963). E35,115/63

Statistical studies on clinical material suggest that "the correlation of acute peptic lesions with acute pathological conditions of the central nervous system may be explained by the mechanism of stress. In cases with a severe stress condition, shock is usually present, and in shock there is stasis of blood and haemoconcentration. In the mucous membrane of the stomach and the duodenum, small infarctions are formed, which are di-

gested as a result of the concomitant hyperacidity of the gastric contents in shock."

Menguy, R., Masters, Y. F.: "Mechanism of stress ulcer: influence of hypovolemic shock on energy metabolism in the gastric mucosa" (abstracted). *Digestion* 10: 233 (1974). H91,851/74

In rats, hypovolemic shock produced by hemorrhage results in gastric ulcers, presumably owing to shock-induced ischemia with diminution of energy metabolism in the mucosa.

GASTROINTESTINAL DISEASES OF ADAPTATION

Peptic Ulcers

Acute gastroduodenal peptic ulcers or bleeding surface erosions known as "stress ulcers" are among the most characteristic manifestations of stress induced by trauma in man as well as in various other mammals. The abundant literature on this topic furnishes much detail on the histologic structure, distribution, and occurrence of stress ulcers, both after surgical interventions and as a consequence of accidental wounds (especially those sustained in combat). Their development has been investigated by light microscopy, EM and even by sequential photographic studies of the gastric mucosa before and after bleeding. Complications, such as sepsis and emotional arousal, may increase the incidence and aggravate the intensity of stress ulcers. Cranial injuries

appear to be particularly likely to elicit such lesions, but among the many mechanisms mentioned as possible causes, none appears to be supported by fully convincing arguments.

There is still some controversy about whether the acute hemorrhagic gastric erosions produced by sudden stress in man and in experimental animals are truly comparable to the classic, chronic peptic ulcers of clinical medicine. It is highly likely that the two lesions merely represent the acute and chronic stage of the same derangement.

In any event, the fact that extensive skin burns can produce duodenal ulcers in man was described by Swan in 1823, Cooper in 1839, and Long in 1840, although the discovery is usually attributed to Curling, whose monograph was published in 1842.

This observation has often been confirmed, not only after burns but also upon exposure to other severe stressors, such as surgery (especially brain lesions), massive infections, acute anxiety ("air raid ulcers") and so on. On the other hand, common, everyday stressful life events may be conducive to chronic peptic ulcers.

A statistical study on Polish miners revealed that hereditary predisposition and nightshift work increase the incidence of peptic ulcers.

According to one statistical study, 32.5 percent of ATCs suffered from duodenal or gastric ulcers.

In a patient with a gastric fistula, it was possible to establish that spontaneously-occurring day-to-day stress situations are associated with increased acidity and decreased mucoprotein concentrations in the gastric juice; this rendered the mucosa extremely fragile, leading to the appearance of small erosions and hemorrhagic spots. Other extensive psychologic and psychoanalytic studies have likewise revealed the importance of mental stress in regulating gastric secretion and ulcer formation. Predisposition to anxiety is one of the principal characteristics of the so-called "peptic ulcer personality."

Allegedly, both acute and chronic stress stimulates pepsin secretion by the stomach via the hypothalamus-pituitary-adrenocortical axis, that is, independently of the vagus nerve.

In patients with CNS injury, the serum gastrin level is unusually high and corresponds to their extraordinary predisposition to stress-ulcer formation.

Anxiety stimulates gastric hydrochloric acid and enzyme secretion but causes ulceration only in predisposed individuals. Hence, here again, we are dealing with a pluricausal pathogenic situation.

A great deal has been written about the relative ulcerogenic effect of various occupations but there is no conclusive evidence that executives have a higher ulcer incidence than their subordinates. As we said in connection with so many stress manifestations, it is not what happens to you but the way you take it that really counts. In some people, the responsibility of giving orders, in others the obligation to follow them, is more stressful. Hence, the best way to avoid stress ulcers is to develop a philosophy of life that permits friction-free interpersonal relations. The frequent combination of peptic ulcers in the upper intestinal tract with ulcerative colitis and other diseases of adaptation likewise argues in favor of a common etiology, namely, stress.

Anatomic studies revealed that stasis and minute infarctions in the mucosa of the stomach and duodenum are usually associated with peptic ulcers and presumably are of pathogenic significance.

There is ample evidence that children are at least as subject to stress ulcer formation as adults.

In one series of women with chronic peptic ulcers, the symptoms regularly disappeared during pregnancy.

Among the therapeutic measures recommended for stress ulcers, ingestion of milk and antacids proved to be particularly efficacious, but a detailed description of the clinical problems would be beyond the scope of this monograph.

Peptic Ulcers

(See also our earlier stress monographs, p. xiii, and *cf.* Psychosomatic Diseases of Adaptation as well as Gastrointestinal System under Morphologic Changes)

The author believes that it is incorrect to speak of "stress ulcers" without specifying the type. He distinguishes between (1) Curling's ulcer after lesions in the CNS or psychic stress, in which cholinergic mediation leads to over-secretion of acid and pepsin with normal mucus production, (2) Curling's ulcer after burns, especially when complicated by septicemia, hypervolemia and circulatory disturbances, (3) steroid ulcer after treatment with ACTH or glucocorticoids, with quantitative and qualitative diminution of mucus production and (4) ulcers after other stress situations in which blood loss, shock, ischemia and other humoral factors are of central importance (32 refs.).

History. Cooper, S.: "Pathology of burns and scalds." *Lond. Med. Gaz.* **23**: 837-838 (1839).

72,145/1839

In an eight-year-old girl who died about five weeks after severe scalds of the chest, an ulcer "about the size of a shilling" was noted in the duodenum just beyond the pylorus. Duodenal ulcers were also found after scalds and burns in other children.

Long, J.: "On the post-mortem appearances found after burns." *Lond. Med. Gaz.* **25**: 743-750 (1840).

B4,643/1840

One of the first descriptions of perforating duodenal ulcers, seen in eleven patients who died from extensive burns. "I have been induced to give the two cases of perforation of the duodenum in detail, as I believe they are unique; indeed I am not aware of any case being recorded, of perforation of the gastro-intestinal tube occurring after a burn, except the one I have quoted from Liston, which approximates to my two cases by the perforation being near the pylorus,

and by the change which had taken place in the duodenum."

Brinton, W.: *On the Pathology, Symptoms and Treatment of Ulcer of the Stomach.* London: John Churchill, 1857.

E3,954/1857

The author concludes that "mental anxiety ... so frequently coincides with ulcer that we are fully entitled to regard it as a more or less immediate cause."

Billroth, T.: "Aus klinischen Vorträgen. I. Ueber Duodenalgeschwüre bei Septicämie" (From clinical lectures. About duodenal ulcers in septicemia). *Wien. Med. Wochenschr.* **17:** 705-709 (1867). 23,917/1867

Description of patients with duodenal ulcers following septicemia as a consequence of operations on the thyroid or other causes. The so-called Curling's ulcer after extensive skin burns is also ascribed to the associated blood poisoning, that is, to sepsis.

Bardeen, C. R. "A study of the visceral changes in extensive superficial burns." *J. Exp. Med.* **2:** 501-514 (1897).

B19,954/1897

Autopsy report on several patients who died from severe skin burns revealed gastric or duodenal ulcers and thymicolumphatic atrophy, as well as hepatic and renal changes. Patients who died during the first few hours showed predominantly edematous lymphatic organs. "These lesions of the lymphatic tissue furnish most important additional evidence of a toxæmia after superficial burns."

Guilbert, J., Bounous, G., Gurd, F. N.: "Role of intestinal chyme in the pathogenesis of gastric ulceration following experimental hemorrhagic shock." *J. Trauma* **9:** 723-743 (1969). J10,786/69

Allegedly, gastric ulcers and intestinal hemorrhagic necrosis following extensive burns were observed by Dupuytren (1823), Swan (1823), Cooper (1839) and Long (1840), before Curling (1842) described the lesions which now bear his name. The literature on these and many subsequent observations on peptic ulceration following surgical interventions is reviewed up to recent times, when ulcers were recognized as part of the G.A.S. (98 refs.).

Hinchey, E. J., Hreno, A., Benoit, P. R., Hewson, J. R., Gurd, F. N.: "The stress ulcer syndrome." In: Welch, C. E., *Advances in Surgery*, Vol. 4, p. 325-392. Chicago: Year Book Medical Publ., 1970. J19,355/70

History and clinical characteristics of the stress ulcer syndrome, with comments on its pathogenesis and therapy (185 refs.).

Review of eighty-eight cases of acute stress ulcer which developed after surgical trauma, sepsis, and miscellaneous diseases. "Acute stress ulceration is usually present in the form of a single ulcer, either gastric or duodenal" (28 refs.).

Wense, G., Kreuzer, W.: "Stress ulcer" (The stress ulcer). *Bull. Soc. Int. Chir.* **27:** 513-520 (1968). G66,162/68

Stress ulcers frequently occur after traumatic surgical operations and may be associated with greatly increased 17-OHCS excretion.

Eiseman, B., Heyman, R. L.: "Stress ulcers; a continuing challenge." *N. Engl. J. Med.* **282:** 372-374 (1970). H21,079/70

The common occurrence of "stress ulcers" in combat casualties stimulated a review on

the pathology and etiology of this lesion, with special reference to the roles of mucus, gastric-cell growth, histamine and therapeutic measures.

Kunzman, J.: "Management of bleeding stress ulcers." *Am. J. Surg.* **119**: 637-639 (1970). G75,612/70

"Bleeding stress ulcers developed in seventy-four young men without previous ulcer disease and with major injuries received in the Vietnam war." Among various therapeutic procedures (vagotomy, pyloroplasty), rapid, aggressive treatment for the underlying illness was most effective.

Reding, R., Festge, A.: "Über das Auftreten postoperativer und posttraumatischer akuter Erosionen und Ulzerationen des Magens und Zwölffingerdarms" (The occurrence of acute postoperative and posttraumatic erosions and ulcerations of the stomach and duodenum). *Zentralbl. Chir.* **95**: 582-588 (1970). J21,698/70

Lucas, C. E., Sugawa, C., Riddle, J., Rector, F., Rosenberg, B., Walt, A. J.: "Natural history and surgical dilemma of 'stress' gastric bleeding." *Arch. Surg.* **102**: 266-273 (1971). G82,156/71

In patients undergoing major surgery or having septic complications, gastrointestinal bleeding was commonly observed. "Sequential photographic studies of the gastric mucosa performed prior and subsequent to bleeding revealed a wide spectrum of erosions limited to the body of the stomach. Gastric hypersecretion was present in most patients." Determinations of gastric mucus, as well as histologic and EM studies are also reported.

Lev, R., Molot, M. D., McNamara, J., Stremple, J. F.: "'Stress' ulcers following war wounds in Vietnam. A morphologic and histochemical study." *Lab. Invest.* **25**: 491-502 (1971). G87,574/71

Histologic study of stress ulcers following combat wounds in Vietnam. There was "acute inflammation and fibrin in the fresher ulcers and larger erosions. Chronic inflammatory cells, granulation tissue, and advanced epithelial repair were found in the older, deeper ulcers. In noneroded areas, patches of cuboidal surface epithelium with reduced cytoplasmic mucin and, elsewhere, foci of mucous cell hyperplasia were found. The cuboidal epithelium was interpreted as a form of chronic regenerative response to sustained injury. Mast cells were decreased in the areas of regeneration. It is concluded that

stress ulcers are accompanied by the usual type of inflammation and repair, that the injurious stimulus responsible for mucosal damage acts over a prolonged period from the time of original trauma (and/or associated surgery) onward, and that reduction in cytoplasmic mucus and degranulation of mucosal stromal mast cells may contribute to increased susceptibility to mucosal ulceration" (33 refs., excellent photographs).

Stremple, J. F., Molot, M. D., McNamara, J. J., Mori, H., Glass, G. B. J.: "Posttraumatic gastric bleeding. Prospective gastric secretion composition." *Arch. Surg.* **105**: 177-185 (1972). G93,305/72

In nine of fifty combat casualties, bleeding ulcers developed although steroid excretion remained within the normal range. Total gastric juice sialic acid output was independent of bleeding but the total "leak" of plasma protein was greater in the gastric ulcer group. "Initial decreased acid output, accompanied by plasma protein 'leakage' into the gastric lumen, is consistent with back diffusion of H⁺ ions soon after trauma," as has been postulated for stress ulcers occurring in the G.A.S. (33 refs.).

Fischer, R. P., Stremple, J. F.: "Stress ulcers in post-traumatic renal insufficiency in patients from Vietnam." *Surg. Gynecol. Obstet.* **134**: 790-794 (1972). H54,661/72

Stress ulcers are common during posttraumatic renal insufficiency among patients wounded in Vietnam. However, "sepsis, rather than renal insufficiency, probably is the reason for the high incidence of ulcers in these patients."

Fischer, H.: "Das Stress-Ulcus, eine Gefahr für den Unfallverletzten" (The stress ulcer, a danger to the accident victim). *Monatschr. Unfallheilk.* **75**: 124-130 (1972). G90,741/72

Histologic characterization of stress ulcers after severe trauma. There is much necrosis and relatively little inflammation with fibrosis.

Glass, G. B. J., Stremple, J. F.: "Stress ulcers." *Lancet* June 30, 1973, pp. 1506-1507. H71,825/73

Among soldiers wounded in battle, gastric bleeding and gastric or duodenal ulcers are common and are associated with increased nonsulfated glycoprotein secretion into the gastric juice.

Marchal, G., Balmes, M., Vergue, J., Selami, A.: "Les hémorragies par ulcération

de stress" (Hemorrhage due to stress ulcers). *Ann. Chir.* **27**: 1266-1268 (1973).

J10,030/73

Statistical studies on the frequency of "stress ulcers" in man after various surgical interventions.

Review of the literature on the effect of stress upon gastric acidity in animals and man. In patients, chronic anxiety is associated with increased gastric hydrochloric acid secretion and may be related to ulcerogenesis (18 refs.).

Wolff, P., Levine, J.: "Nocturnal gastric secretions of ulcer and nonulcer patients under stress." *Psychosom. Med.* **17**: 218-226 (1955). J13,311/55

Weiner, H., Thaler, M., Reiser, M. F., Mirsky, I. A.: "Etiology of duodenal ulcer. I. Relation of specific psychological characteristics to rate of gastric secretion (serum pepsinogen)." *Psychosom. Med.* **19**: 1-10 (1957). C31,678/57

Studies on more than two thousand army inductees revealed that, independently, "neither a high rate of gastric secretion nor a specific psychodynamic constellation" caused peptic ulcers. "Together, however, these two parameters constitute the essential determinants in the precipitation of peptic ulcer on exposure to social situations noxious to the specific individual" (24 refs.).

Sawrey, W. L., Conger, J. J., Turrell, E. S.: "An experimental investigation of the role of psychological factors in the production of gastric ulcers in rats." In: Reed, C. F., Alexander, T. E. et al., *Psychopathology. A Source Book*, pp. 200-208. Cambridge, Mass.: Harvard University Press, 1958.

C60,677/58

Experiments indicate "(a) that conflict per se contributes significantly to ulcer formation, (b) that hunger and shock also contribute significantly, but only in interaction, (c) that thirst does not contribute significantly, (d) that weight loss alone cannot account for the differences in ulcer formation between conflict and nonconflict groups, and (e) that weight loss is significantly related to the variables of shock, hunger, and thirst, though in the case of the latter two, only through interaction. However, the weight loss in these cases is not directly related to ulcer formation."

Dunn, J. P., Cobb, S.: "Frequency of peptic ulcer among executives, craftsmen, and foremen." *J. Occup. Med.* **4**: 343-348 (1962). J4,086/62

Statistical studies on several Pittsburgh companies showed that foremen suffered from peptic ulcer more frequently than craftsmen or executives. The data do not support the widely held notion that ulcer

disease is unusually high among executives. "Though both the prevalence and the incidence of peptic ulcer within the several groups correlated well with the level of serum pepsinogen it remains an enigma that the mean pepsinogen levels should be lowest for the foremen and highest for the executives."

Susser, M., Stein, Z.: "Civilisation and peptic ulcer." *Lancet* January 20, 1962, pp. 115-119. D46,685/62

"The immediate effects of war are evident in the rise in perforations and deaths from peptic ulcer which followed air-raids and the stress of war." Statistical studies suggest that with "the sharp rise in morbidity and mortality during this century, peptic ulcer, particularly of the duodenum, has earned a place as one of the 'diseases of civilisation'."

In man, partial gastrectomy with vagotomy is recommended as the initial operation when treating hemorrhage associated with stress ulcerations."

Rosoff, C. B., Goldman, H.: "Effect of the intestinal bacterial flora on acute gastric stress ulceration." *Gastroenterology* **55**: 212-222 (1968). G60,200/68

In rats, polymyxin B offers significant protection against acute stress ulcers elicited by restraint, probably because this nonabsorbable antibiotic reduces the coliform bacteria in the intestine. "This change in the flora results in a decrease in the motor tone of the stomach and cecum, and in the volume and concentration of gastric acid produced in response to the stress of immobilization. The protection offered by the coliform-poor state is eliminated when endotoxin is given to antibiotic-treated animals." Conversely, systemic administration of endotoxin increases

both gastric acid and stress ulcers. "It is suggested that, under the conditions induced by stress, detoxification mechanisms suffer and permit absorbed bacterial products to reach the systemic circulation and stimulate the hypothalamus."

J23,616/75

"Human growth hormone was effective in healing erosions and controlling hemorrhage in six of eight patients with stress ulcers."

Experimental Peptic Ulcers

Production of Experimental Peptic Ulcers. The occurrence of acute hemorrhagic gastric and upper-intestinal ulcers was described as one of the characteristic manifestations of the alarm reaction in the first publication in which the latter was reported. Ever since then, a large number of investigators have examined the production of experimental peptic ulcers by the most diverse stressors in rats and other species.

Unlike thymicolumphatic involution, eosinopenia, lymphopenia and many other characteristics of stress, the causation of peptic ulcers does not depend upon the presence of the pituitary or the adrenals, since they occur even after hypophysectomy or adrenalectomy. In fact, it appears that in the absence of the pituitary-adrenal axis, animals become particularly sensitive to the production of gastrointestinal erosions by stress, perhaps as a consequence of their greatly increased responsiveness to any aggression. Undoubtedly, these gastrointestinal ulcerations are part of the damage, not of the defense, elicited by stressors.

Curiously, a great excess of glucocorticoids can also provoke peptic ulcers, or at least condition the mucosa for their production during stress in both experimental animals and man. Here, the pathogenic situation is particularly complicated, but present evidence suggests that any decrease in the vitality of the gastric mucosa predisposes it to erosion by the digestive juices contained in the stomach. For example, in rabbits, the gastric wall usually digests itself and perforates after death. Apparently, hitherto unidentified vital mechanisms must continuously be at work to protect the gastric mucosa against self-digestion. This protection is impaired during severe stress, perhaps owing to the decrease in blood pressure, temperature, metabolism and so on. In addition, autonomic nervous impulses, especially cholinergic secretory stimuli, appear to participate in the production of these ulcers. Here, corticoids can play a dual role by protecting the mucosa when they antagonize shock and by predisposing it to ulceration when given in large amounts that suppress defensive phenomena in general, particularly protective granuloma formation in the connective tissue under the mucosa. That is why the crater of chronic ulcers often perforates in patients given large amounts of corticoids (for example, for rheumatoid arthritis). A better understanding of this complex pathogenesis, in which a general decrease in vitality, secretory autonomic impulses and corticoids participate, helps to explain many of the apparently paradoxical reports in the literature (for example, the fact that under varying circumstances corticoids can prevent or produce ulcers).

A great deal has been said about the experiments on "executive monkeys." Rhesus monkeys were placed in restraining chairs where some of them could, while others could not, prevent electric shocks by pressing a lever. Unexpectedly, those that had "executive control" over their stressor developed gastric and duodenal ulcers even more frequently than did the controls. These findings have been regarded as illustrating the high stressor effect of decision making, but this interpretation is not unanimously accepted.

Comparison of ulcer production in rats by avoidable and unavoidable electroshocks led to the concept that alterations in feedback from responding can considerably influence ulcer formation. This may explain the "executive monkey" phenomenon.

Gastric ulcers developed in rats exposed to various stressors, especially if they were sacrificed only two hours after the stress period. Presumably, reversal from stressful to ordinary conditions is also an ulcerogenic factor.

EM studies have shown that, in rats, gastric ulcers produced by a response-avoidance procedure or restraint begin with an initial surface breakthrough involving only a few cells and then the mucosal lesions increase by erosion of the more vulnerable lateral and basal cell surfaces.

Although acute stress ulcers are usually localized in the gastric mucosa, especially in rats, this is not always the case. Both acute and chronic duodenal ulcers may also develop during stress.

It has been claimed that the ulcer-producing agent can be transmitted through the blood in rats united by parabiosis since erosions occur in both partners even if only one is restrained on a mobile cart which the unrestrained partner is free to pull about. However, it may be assumed that under these conditions both animals are under considerable stress.

Certain drugs appear to have a specific ulcerogenic tendency. Thus, in the rat (which, as we have said, is normally rather resistant to duodenal ulcer production) propionitrile, and even more consistently, cysteamine produces perforating duodenal ulcers. The relationship of these to typical stress ulcers remains to be clarified, but the cysteamine-induced duodenal ulcers of the rat generally respond to the same therapeutic agents as the spontaneous duodenal ulcers of man; hence "they represent a useful model to detect antiulcer agents, and to study the mechanism of duodenal ulcer formation."

Large doses of digitoxin (like propionitrile and cysteamine) allegedly produce duodenal ulcers, but in our experience this has occurred only exceptionally.

Sensitization, Prophylaxis and Treatment of Experimental Stress Ulcers. Among the factors conditioning the gastric mucosa for stress-induced ulceration, I already alluded briefly to the role of corticoids and autonomic nervous impulses; these influence the resistance and secretory activity of the gastric mucosa.

In dogs, gastroduodenal ulcers were produced by electroshock stress, especially after reserpine sensitization. This synergistic effect was ascribed to the peptic action of gastric juice upon a mucosa damaged by angiitis.

Experiments on stress-induced ulcers in the rat have shown that fasting, cold and various other agents that aggravate stress in general also increase the tendency to develop gastrointestinal ulcers, whereas local application of antacids or glucose exerts a prophylactic effect.

The ulcers produced by stressors differ qualitatively from those elicited by the histamine liberator 48/80 in that the latter are readily prevented by glucocorticoids although these can themselves provoke gastric erosions if administered in very high doses.

Vagotomized rats are relatively resistant to stress ulcer formation, whereas—as previously stated—hypophysectomy or adrenalectomy predisposes to it.

The healing of the restraint-induced gastric ulcers is delayed by glucocorticoids in the rat presumably because of interference with the production of the protective granuloma in the ulcer crater.

Among other drugs that prevent stress ulcer formation in rats, we may mention anti-cholinergics, CNS depressants, fusaric acid (a dopamine hydroxylase inhibitor), nicotinic acid, chlorpromazine, asiaticoside (which also prevents cysteamine-induced duodenal ulcers) and prostaglandins. On the other hand, the ulcerogenic effect of stress-

ors is aggravated in rats by acetylsalicylic acid or large doses of reserpine (which is ulcerogenic in itself).

Curiously, atropine and other anticholinergic agents protect against ulcers when given in small doses; at the same time, they may produce ulcers in the proventriculus, which is normally unaffected by stress.

Calcitonin offers considerable protection against restraint-induced gastric ulcers.

Diazepam, vagotomy and particularly, combined application of both agents, offer considerable protection against stress-induced gastric ulcers in the rat. Presumably, the two act through different mechanisms.

Experimental Peptic Ulcers

←Neuropsychologic Stimuli. Brady, J. V.: "Ulcers in 'executive' monkeys." *Sci. Am.* **199**: 95-99 (1958). B28,871/58

Rhesus monkeys were placed in restraining chairs where some of them could, and others could not, prevent electric shocks by pressing a lever. Those that had control over the situation, the "executive monkeys," developed gastric and duodenal ulcers while the controls did not. Unexpectedly, even prolonged periods of this type of stress were not ulcerogenic, and "periodic emotional stress apparently causes ulcers only if its period coincides with that of some natural rhythm of the gastrointestinal system."

Levrat, M., Lambert, R.: "Experimental ulcers produced in rats by modification of environment." *Gastroenterology* **37**: 421-426 (1959). C77,394/59

Production of gastric ulcers in rats by the stress of placement in a shaking cage and intermittent photic stimulation.

Weiss, J. M.: "Influence of psychological variables on stress-induced pathology." In: Porter, R. and Knight, J., *Physiology, Emotion and Psychosomatic Illness*, pp. 253-278. Amsterdam, London and New York: Associated Scientific, 1972. J15,758/72

In rats exposed to electroshocks, predictability, avoidability and escapability of the stressor had a considerable influence upon the severity of tissue pathology. The theory is developed which holds "that ulceration is a function of two variables: the number of coping attempts an animal makes and the informational feedback it receives from making the coping attempts. Experiments have been carried out which show that alterations in feedback from responding greatly increase or decrease ulceration. The theory also explains a well-known paradoxical finding, the 'executive monkey' phenomenon."

Mikhail, A. A.: "Stress and ulceration in the glandular and nonglandular portions of the rat's stomach." *J. Comp. Physiol. Psychol.* **85**: 636-642 (1973). J8,643/73

Allegedly, "conditioned fear and conflict produce ulceration in the nonglandular portion of the stomach (rumen), while immobilization produces ulceration in the glandular portion (corpus)" in rats.

Freimark, S. J.: "Effects of electrical stimulation of the brain on the formation of acute gastric lesions." *Physiol. Behav.* **11**: 855-859 (1973). J8,677/73

In rats on a schedule of food-reinforced bar pressing, exposure to an unpredictable number of electric shocks induced the formation of gastric ulcers. High but not low frequency electric stimulation of the medial forebrain bundle attenuated the gastric changes produced by unpredictable footshock. Electric stimulation of the brain was used as a positive reinforcing event, since previous studies have shown it to be effective in this respect.

Morris, G. P., Harding, R. K.: "Topography and fine structure of acute fundic mucosal erosions in the rat." *Lab. Invest.* **30**: 639-646 (1974). J12,845/74

"Acute focal mucosal lesions occurred in rats following exposure to a response-avoidance schedule of 3 to 12 hours' duration. The topography of the fundic mucosa of experimental, yoked control, and normal animals was compared in the scanning electron microscope. Transmission electron microscopy was employed to substantiate and clarify the re-

sults of these topographic studies." The authors believe that "after an initial surface breakthrough involving a small number of cells, mucosal lesions increase in area, primarily by erosion of the more vulnerable lateral and basal cell surfaces."

→Electric Stimuli. Sawrey, W. L., Weisz, J. D.: "An experimental method of producing gastric ulcers." *J. Comp. Physiol. Psychol.* **49**: 269-270 (1956). G46,668/56

Gastric ulcers developed in fasted rats kept in a cage where they received an electric shock every time they approached receptacles containing food or water.

Brodie, D. A., Hanson, H. M., Sines, J. O., Ader, R.: "Current research on gastric ulcers." *J. Neuropsychiatry* **4**: 388-408 (1963). J2,287/63

Symposium on the experimental production of stress ulcers, particularly by restraint and electroshock, in the stomach of the rat. The influence of diet, vagotomy, adrenalectomy, corticoids, hypophysectomy, anticholinergic drugs and so on, upon these erosions is discussed (54 refs.).

Selzer, M. L.: "Stress ulcers and renal disease following electric convulsive therapy." *Psychiatr. Q.* **37**: 509-517 (1963).

Moreva, E. V.: "Biochemical changes in the brain during reflexes causing degeneration of the gastric mucosa." *Biull. Èksp. Biol. Med.* **62** No. 7: 49-52 (1966) (Russian). Engl. trans.: *Bull. Exp. Biol. Med.* **62**: 772-774 (1966). J24,289/66

In rats stressed by combined electroshock and restraint, the development of gastric lesions was accompanied by a "reduction in the level of bound acetylcholine mainly in the hypothalamic region and by a decrease in the amount of free acetylcholine mainly in the cerebral hemisphere." The GABA level of the brain was likewise diminished.

Weiss, J. M.: "Somatic effects of predictable and unpredictable shock." *Psychosom. Med.* **32**: 397-408 (1970). G77,862/70

Observations on rats exposed to electroshock show that "the same physical stressor can be markedly altered by psychologic factors such as predictability."

Gliner, J. A.: "Predictable vs. unpredictable shock: preference behavior and stomach ulceration." *Physiol. Behav.* **9**: 693-698 (1972). J444/72

In rats, unpredictable electroshock caused a greater incidence of gastric ulcers than did predictable shock.

Freimark, S. J.: "Effects of electrical stimulation of the brain on the formation of acute gastric lesions." *Physiol. Behav.* **11**: 855-859 (1973). *J8,677/73*

In rats on a schedule of food-reinforced bar pressing, exposure to an unpredictable number of electric shocks induced the formation of gastric ulcers. High but not low frequency electric stimulation of the medial forebrain bundle attenuated the gastric changes produced by unpredictable foot-shock. Electric stimulation of the brain was used as a positive reinforcing event since previous studies have shown it to be effective in this respect.

Wald, E. D., Mackinnon, J. R., Desiderato, O.: "Production of gastric ulcers in the unrestrained rat." *Physiol. Behav.* **10**: 825-827 (1973). *J3,751/73*

In unrestrained rats, gastrointestinal ulcers developed following six hours of exposure to intermittent electroshocks.

Hara, M.: "Gastroduodenal ulcers in dogs produced by electric stress after reserpine." *Nihon Univ. J. Med.* **16**: 119-128 (1974). *J15,282/74*

An article on production of gastroduodenal ulcers by electric stimulation and reserpine in pretreated dogs. The reserpine-stress-induced ulcer is ascribed to the peptic action of gastric juice upon a mucosa damaged by angiitis. Special attention is given to the Japanese literature which is unavailable in English (24 refs.).

←**Restraint.** Rossi, G., Bonfils, S., Lief-fogh, F., Lambling, A.: "Technique nouvelle pour produire des ulcérations gastriques chez le rat blanc: l'ulcère de contrainte" (A new method of producing gastric ulcers in the white rat: the restraint ulcer). *C.R. Soc. Biol. (Paris)* **150**: 2124-2126 (1956).

J3,771/56

Stress ulcers were produced in rats restrained in a wire grill tube for twenty hours.

Brodie, D. A., Hanson, H. M.: "A study of the factors involved in the production of gastric ulcers by the restraint technique." *Gastroenterology* **38**: 353-360 (1960).

C87,271/60

Mice, rats, guinea pigs and hamsters showed a high incidence of gastric ulcers fol-

lowing restraint, whereas rabbits and monkeys were much more resistant. Fasting predisposed the rat to this type of stress ulcer. Young rats proved to be more susceptible than old animals. Hypophysectomy and bilateral subdiaphragmatic vagotomy did not significantly reduce the incidence of restraint ulcers, whereas bilateral adrenalectomy considerably increased it.

Hanson, H. M., Brodie, D. A.: "Use of the restrained rat technique for study of the anti-ulcer effect of drugs." *J. Appl. Physiol.* **15**: 291-294 (1960). *C83,740/60*

In rats, atropine and other anticholinergic drugs inhibited restraint-induced gastric ulcers. Among the CNS-active agents, chlorpromazine, benactyzine and pentobarbital had a protective effect, but acetazolamide was inactive in this respect. Prednisolone delayed healing of existent ulcers.

François, G. R., Sines, J. O.: "Stress induced stomach lesion as related to destruction of the sympathetic ganglia." *J. Psychosom. Res.* **5**: 191-193 (1961).

Brodie, D. A., Hanson, H. M., Sines, J. O., Ader, R.: "Current research on gastric ulcers." *J. Neuropsychiatry* **4**: 388-408 (1963). *J2,287/63*

Symposium on the experimental production of stress ulcers, particularly by restraint and electroshock, in the stomach of the rat. The influence of diet, vagotomy, adrenalectomy, corticoids, hypophysectomy, anticholinergic drugs and so on, upon these erosions is discussed (54 refs.).

Guth, P. H., Mendick, R.: "The effect of chronic restraint stress on gastric ulceration in the rat." *Gastroenterology* **46**: 285-286 (1964). *G18,489/64*

Restraint is very useful for producing experimental ulcers in the rat, but after a certain time adaptation occurs and during the phase of resistance the ulcerogenic effect of this stressor diminishes.

Frisone, J. D., Essman, W. B.: "Stress-

induced gastric lesions in mice." *Psychol. Rep.* **16**: 941-946 (1965). G41,731/65

"Immobilization-induced stress contributed little more to the incidence and severity of gastric lesions in mice than did food deprivation alone." Apparently, the gastric ulcers produced by restraint are essentially due to fasting.

Sines, J. O.: "Elevated activation level as a primary characteristic of the restraint stress-ulcer-susceptible rat." *Psychosom. Med.* **28**: 64-69 (1966). G42,964/66

Restraint is most effective in producing gastric ulcers in rats if it is imposed at the peak of their activity, whether spontaneous or artificially induced.

Buchel, L., Gallaire, D.: "Influence de la température ambiante sur la production d'ulcères de contrainte chez le rat" (Influence of surrounding temperature on the production of restraint ulcers in rats). *C.R. Soc. Biol. (Paris)* **160**: 1817-1820 (1966).

F78,016/66

A decrease of the surrounding temperature from 24 to 14°C facilitates the production of restraint ulcers in rats, whether or not they are previously exposed to twenty-four hours of fasting. Yet starvation facilitates and accelerates the development of such restraint ulcers. On the other hand, body temperature does not appear to be the only important factor since rats kept at warm temperatures (28-32°C) still show gastric erosions, whereas treatment with phenobarbital or chloral hydrate during restraint aggravates the hypothermia and yet diminishes ulcer frequency.

Robert, A., Phillips, J. P., Nezamis, J. E.: "Production by restraint, of gastric ulcers and of hydrothorax in the rat." *Gastroenterology* **51**: 75-81 (1966). G40,473/66

In rats, restraint produced gastric ulcers and hydrothorax within four to six hours. Overnight fasting prevented the hydrothorax and reduced the gastric ulcerations (contrary to previous reports). Restraint ulcers and hydrothorax "were also inhibited by crowding of the animals, a rise in ambient temperature, or administration of prednisolone."

Brodie, D. A., Hanson, H. M.: "Restraint-induced gastric lesions." *J. Indian Med. Prof.* **12**: 5601-5606 (1966). J24,576/66

Wilson, T. R.: "Age and susceptibility to gastric ulceration in male and female rats." *Gerontologia (Basel)* **12**: 226-230 (1966). F78,288/66

Young rats are much more susceptible to restraint-induced gastric ulcers than adults.

Even self-immobilization, in which an unrestrained rat avoids footshock by remaining motionless, can produce stress ulcers (24 refs.).

Schwiller, P. O., Schellerer, W., Reitzenstein, M., Hermanek, P.: "Hyperglucagonemia, hypocalcemia and diminished gastric blood flow—evidence for an etiological role in stress ulcer of rat." *Experientia* **30**: 824-826 (1974). H90,543/74

In intact and adrenalectomized rats, re-

straint causes gastric ulcers with a considerable rise in glucagon and a decrease in gastrin attributed to stress.

Bauer, R. F., Ambromovage, A. M.: "The effect of restraint stress on food stimulated gastric secretion in the rhesus monkey." *Fed. Proc.* **33**: 330 (1974). H84,089/74

The increase in volume and acidity of gastric juice following food stimulation is diminished by restraint.

Popperová, E., Nikš, M., Hulín, I.: "Gastric motility and acidity in experimental gastric ulcer." *Folia Fac. Med. Univ. Comeniana Bratisl.* **12**: 55-105 (1974) (Czech, with extensive English summary).

J14,078/74

A detailed study on the mechanism of stress ulcer formation during restraint in the rat. Both the motility and the secretion of the stomach can readily be followed during ulcerogenesis by the technique employed (120 refs.).

Tran, T. A., Gregg, R. V.: "Transmittal of restraint-induced gastric ulcers by parabiosis in rats." *Gastroenterology* **66**: 63-68 (1974).

J9,758/74

In rats, induction of gastric ulcers "in the parabiotic mate of a restrained rat implicates a humoral factor in the etiology" of this lesion. In this experiment, "one rat of a parabiosed pair was restrained for 28 or 30 hr. on a mobile cart which its unrestrained mate was free to pull about. All restrained animals showed gastric ulceration, and 15 of 17 unrestrained mates also developed gastric ulceration" (28 refs.). [It may be assumed, however, that the control animal was also under considerable stress under such conditions (H.S.).]

←Reserpine (See also Drugs under Agents). Blackman, J. G., Campion, D. S., Fastier, F. N.: "Mechanism of action of reserpine in producing gastric haemorrhage and erosion in the mouse." *Br. J. Pharmacol.* **14**: 112-116 (1959). C68,958/59

Gastric hemorrhage and erosion are produced in mice by reserpine through a mechanism involving liberation of 5-HT.

Damrau, F.: "Peptic ulcers induced in white rats by reserpine and stress. The protective action of roterized bismuth subnitrate." *Am. J. Gastroenterol.* **35**: 612-618 (1961). D92,441/61

Harrity, A. L.: "The effects of reserpine

on the psychogenic production of gastric ulcers in rats." *J. Comp. Physiol. Psychol.* **55**: 719-721 (1962). J23,448/62

Observations on rats suggest that "although reserpine does not in itself induce ulceration at low dosages, it does appear to interact with restraint stress to increase ulceration."

Niks, M., Janovjakova, E., Hulin, I.: "Interaction between reserpine and stress in the production of experimental gastric ulcer." *Bratisl. Lék. Listy* **48**: 80-84 (1967).

J24,399/67

Kido, R.: "The hypothalamus and stomach function, with special reference to experimental peptic ulcer induced by administration of reserpine." *Brain Nerve (Tokyo)* **19**: 467-476 (1967) (Japanese). J25,107/67

Doteuchi, M.: "Studies on the experimental gastrointestinal ulcers produced by reserpine and stress. I. Relationship between production of ulcers and changes in tissue monoamines." *Jap. J. Pharmacol.* **17**: 638-647 (1967). F96,238/67

Doteuchi, M. "II. Ulcerogenic activities of reserpine and its analogues." *Jap. J. Pharmacol.* **18**: 130-138 (1968). J16,601/68

Observations on cats suggest that a decrease in peripheral and central monoamines is involved in gastric ulcer formation by reserpine and its analogues in combination with electroshock.

Doteuchi, M. "III. Effects of monoamines and their precursors." *Jap. J. Pharmacol.* **18**: 175-184 (1968). J16,602/68

In cats, gastric ulcer formation by reserpine plus electroshock could be inhibited by 5-hydroxytryptophane, dopa and atropine. These and other observations suggested that a decrease in the monoamine content of the CNS was involved in stress ulcer formation.

Nakane, S., Sakai, T.: "The effect of reserpine on stress-induced stomach ulcer in rats." *Folia Pharmacol. Jap.* **69**: 549-555 (1973) (Japanese). J22,204/73

Gupta, M. B., Tangri, K. K., Bhargava, K. P.: "Mechanism of ulcerogenic activity of reserpine in albino rats." *Eur. J. Pharmacol.* **27**: 269-271 (1974). H89,397/74

In rats, reserpine-induced gastric ulcers were prevented by α -adrenergic blockers, 6-hydroxydopamine and atropine, but not by

adrenalectomy. Presumably, both adrenergic and cholinergic mechanisms are involved in reserpine-induced stress ulcers.

←Other Drugs Producing Peptic Ulcers.
Selye, H., Szabo, S.: "Experimental model for production of perforating duodenal ulcers by cysteamine in the rat." *Nature* **244**: 458-459 (1973). G88,067/73

In rats, cysteamine produces perforating duodenal ulcers with even greater frequency and consistency than does 3,4-toluenediamine or propionitrile. However, to a large extent, these must be due to specific effects of the drugs, since nonspecific stress ulcers are located predominantly in the glandular stomach of this species. Yet this model may be of interest in elucidating the mechanism responsible for stress ulcers, as these are frequently localized in the duodenum in man.

Cheney, D. H., Slogoff, S., Allen, G. W.: "Ketamine-induced stress ulcers in the rat." *Anesthesiology* **40**: 531-535 (1974).

J13,522/74

In rats, restraint produced stress ulcers, whereas at the dose levels given ketamine alone did not, but it did increase the incidence of restraint-induced ulcers from 35 percent to almost 100 percent. This sensitization was counteracted by phenoxybenzamine and halothane, "suggesting that the action of ketamine is mediated by vasoconstriction. Antihistamine pretreatment with promethazine was without effect."

Glass, G. B. J., Pitchumoni, C. S., Kawashima, K.: "Gastric injury from acute and chronic alcohol use: its potentiation by stress" (abstracted). *Clin. Res.* **22**: 558A (1974). H90,434/74

In mice, "acute ethanol excess and stress are more important than underlying gastritis in causing mucosal injury and bleeding."

Robert, A.: "Experimental production of duodenal ulcers." *Biol. Gastroenterol. (Paris)* **7**: 145-161 (1974). J19,366/74

Comparison of various methods for the production of duodenal ulcers in rats, with special emphasis upon those elicited with cysteamine, 3,4-toluenediamine, and other drugs.

Robert, A., Lancaster, C., Nezamis, J., Badalamenti, J.: "A new model to test antiulcer agents, cysteamine-induced duodenal ulcers." *Fed. Proc.* **33**: 310 (1974).

H84,075/74

Cysteamine-induced duodenal ulcers in rats generally respond to the same therapeutic agents as spontaneous duodenal ulcers in man. Hence, "they represent a useful model to detect antiulcer agents, and to study the mechanism of duodenal ulcer formation."

Szabo, S., Dzau, V. J., Feldman, D., Reynolds, E. S.: "Effect of propionitrile and cysteamine on gastric secretion in rats" (abstracted). *Clin. Res.* **22**: 370A (1974).

H90,258/74

"The production of duodenal ulcer in the rat by propionitrile or cysteamine is associated with enhanced gastric secretion and acid output."

Robert, A., Nezamis, J. E., Lancaster, C., Badalamenti, J. N.: "Production of duodenal ulcers in the rat by administration of digitoxin." *Experientia* **30**: 781-783 (1974).

H90,530/74

In rats, large doses of digitoxin (like propionitrile and cysteamine) may produce duodenal ulcers. The role of stress in this response remains to be determined.

Mangla, J. C., Kim, Y., Desbaillets, L. G.: "Carbazochrome salicylate and its role in aspirin-induced gastric irritation in rats." *Am. J. Dig. Dis.* **19**: 830-834 (1974).

J15,798/74

Acetylsalicylic acid produced gastric ulcers in rats. Presumably, these were due to a specific gastrototoxic effect of the drug, since they occurred at dose levels that caused no severe manifestations of stress. Contrary to earlier claims, carbazochrome salicylate complex failed to antagonize these aspirin ulcers (14 refs.).

Greenberg, L., Himal, H. S.: "Hydrochloric acid clearance and endotoxin induced duodenal erosions in dogs." *Surg. Gynecol. Obstet.* **139**: 561-565 (1974).

H92,596/74

In dogs, intravenous endotoxin inhibited transmucosal hydrogen ion passage, bile flow, and pancreatic juice flow, all of which normally clear instilled hydrochloric acid. When bile and pancreatic ducts were ligated and acid instilled, the high concentration of hydrochloric acid remaining in the pouches led to acute duodenal erosions. When no acid was instilled, endotoxin markedly stimulated fluid and electrolyte flow into the lumen and was associated with hemorrhagic necrosis of the duodenal mucosa. The authors conclude that duodenal damage caused by endotoxin may vary from acute focal erosions to hemor-

rhagic necrosis, depending upon the ability of the duodenum to clear hydrochloric acid.

←**Sensitization** (See also preceding sections on the production of experimental peptic ulcers by various means). Dragstedt, L. R., Ragins, H., Dragstedt, L. R., Evans, S. O. Jr.: "Stress and duodenal ulcer." In: Moritz, A. R. and Helberg, D. S., *Trauma and Disease. Selections from the Recent Literature*, p. 792. New York: Central Book (1959).

C44,814/59

After vagotomy, stress and corticoids fail to produce gastric ulcers in dogs.

Sines, J. O.: "Selective breeding for development of stomach lesions following stress in the rat." *J. Comp. Physiol. Psychol.* **52**: 615-617 (1959).

J19,353/59

Selective mating of rats which readily developed gastric ulcers during restraint led to offspring which were even more genetically ulcer-prone.

Brodie, D. A., Hanson, H. M.: "A study of the factors involved in the production of gastric ulcers by the restraint technique." *Gastroenterology* **38**: 353-360 (1960).

C87,271/60

Adrenalectomy greatly sensitizes rats to the production by restraint of gastric ulcers.

Bonfils, S., Dubrasquet, M., Potet, F., Lambling, A.: "Influence de l'hypophysectomie sur l'ulcère expérimental de contrainte. Test de la pente de restriction" (Influence of hypophysectomy on experimental restraint ulcers. The test of graded restriction). *C.R. Soc. Biol. (Paris)* **155**: 1928-1930 (1961).

D21,555/61

Hypophysectomy actually increases the incidence of restraint ulcers in the rat.

Harjola, P. T., Sivula, A.: "Gastric ulceration following experimentally induced hypoxia and hemorrhagic shock: *in vivo* study of pathogenesis in rabbits." *Ann. Surg.* **163**: 21-28 (1966) (22 refs.).

Rosolovskii, A. P.: "The effect of the thyroid gland on the appearance of trophic affections of the stomach during the action of stress and steroids." *Probl. Endokrinol.* **20** No. 5: 70-72 (1974) (Russian).

H95,571/74

In rats "the ulcerogenic action of stress and steroids increased considerably in experimental hyperthyroidism, and was markedly diminished in hypothyroidism."

Fischer, R. P., Peter, E. T., Mullane, J. F.: "Experimental stress ulcers in acidotic and nonacidotic renal insufficiency." *Arch. Surg.* **109**: 409-411 (1974). J16,376/74

In rats, acute renal insufficiency with acidosis, hyperkalemia and uremia "enhances restraint-induced stress ulcer formation, possibly by impairing the normal reparative process of the gastric mucosa."

Koch, G., Schumpelick, V., Rehren, D. von: "Einfluss der Splenektomie auf Magensaftsekretion und Ulcusentstehung der Ratte" (The effect of splenectomy on gastric secretion and ulcer formation in rats). *Langenbecks Arch. Chir.* **336**: 15-23 (1974). J15,777/74

Splenectomy increases the incidence of gastric ulcers in both restrained and pylorus-ligated rats.

←**Prophylaxis and Treatment** (See also preceding sections on the production of experimental peptic ulcers by various means). Selye, H., MacLean, A.: "Prevention of gastric ulcer formation during the alarm reaction." *Am. J. Dig. Dis.* **11**: 319-322 (1944). A75,010/44

In rats the gastric ulcers produced by transection of the spinal cord at the height of the seventh cervical vertebra "may be prevented by the prophylactic administration of various food substances, aluminum hydroxide gel and especially by comparatively small doses of dextrose. Dextrose is effective when given either per os or intravenously. It prevents gastric ulcer formation even in doses

insufficient to raise the glucose content of the blood above the normal level for the duration of the experiment. The prophylactic effect of dextrose is nonspecific in the sense that the compound prevents the formation of gastric ulcers by a variety of widely different damaging agents such as formaldehyde injections, exposure to cold or spinal cord transection."

Robert, A., Selye, H.: "Effet de la cortisone et de la STH sur l'ulcère gastrique expérimental" (Effect of cortisone and STH on experimental gastric ulcers). *Ann. Endocrinol.* (Paris) **13**: 845-848 (1952).

B70,246/52

In rats, injection of formaldehyde into the gastric wall rapidly produces bleeding and necrotizing gastric erosions that are aggravated by STH but inhibited by cortisone. This is yet another finding that shows the antagonistic behavior of STH and glucocorticoids.

Atwater, J. S., Carson, J. M.: "Therapeutic principles in management of peptic ulcer. 3. Anticholinergic-tranquilizer combination." *Am. J. Dig. Dis.* **4**: 1055-1065 (1959). J18,431/59

Bonfils, S., Rossi, G., Liefooghe, G., Lambling, A.: "'Ulcère' expérimental de contrainte du rat blanc. I. Méthodes. Fréquence des lésions. Modifications par certains procédés techniques et pharmacodynamiques" (Experimental restraint "ulcer" in the white rat. I. Methods. Frequency of lesions. Modifications by some technical and pharmacodynamic procedures). *Rev. Fr. Etudes Clin. Biol.* **4**: 146-150 (1959). J22,385/59

Description of a modification of Selye's restraint technique for the production of stress ulcers in the rat. Adrenalectomy did not influence, whereas cortisone and vagotomy diminished the incidence of gastroduodenal ulcers.

Bonfils, S., Dubrasquet, M., Lambling, A.: "Les utilisations de la technique de l'ulcère de contrainte du Rat blanc comme test pharmacodynamique" (The use of the restraint ulcer technique in the white rat as a pharmacodynamic test). *Thérapie* **15**: 1096-1110 (1960). J23,582/60

Sines, J. O.: "Experimental production and control of stomach lesions in the rat." *J. Psychosom. Res.* **4**: 297-300 (1960).

J23,258/60

Certain strains of rats are especially susceptible to restraint-induced gastric ulcers.

Such lesions can be controlled by anticholinergics but are increased by large doses of chlorpromazine. This "suggests that stomach lesion development in the rat is at least in part dependent upon parasympathetic hyperactivity."

Selye, H., Jean, P., Cantin, M.: "Prevention by stress and cortisol of gastric ulcers normally produced by 48/80." *Proc. Soc. Exp. Biol. Med.* **103**: 444-446 (1960).

C78,128/60

"Experiments on rats indicate that gastric ulcers produced by various stressors (as part of the alarm reaction) differ qualitatively from those induced by the histamine liberator 48/80. The latter lesions as well as the anaphylactoid inflammation and shock produced by 48/80 can actually be prevented by stressors or cortisol, although these same agents are, in themselves, capable of producing the alarm-reaction type of gastric erosion." Evidently, certain types of gastric ulcers can be prevented by glucocorticoids.

Menguy, R.: "Effects of restraint stress on gastric secretion in the rat." *Am. J. Dig. Dis.* **5**: 911-916 (1960).

C93,988/60

"Previously vagotomized rats were partially protected from stress [restraint] ulcers whereas hypophysectomy or adrenalectomy were without effect" (13 refs.).

Hanson, H. M., Brodie, D. A.: "Use of the restrained rat technique for study of the antiulcer effect of drugs." *J. Appl. Physiol.* **15**: 291-294 (1960).

C83,740/60

In rats, atropine and other anticholinergic drugs inhibited restraint-induced gastric ulcers. Among the CNS-active agents, chlorpromazine, benactyzine and pentobarbital had a protective effect while acetazolamide was ineffective. Prednisolone delayed healing of existent ulcers.

Bonfils, S., Dubrasquet, M., Lambling, A.: "Ulcère expérimental de contrainte. Quelques applications du test de la pente de restriction" (Experimental restraint ulcer. Some uses of the restriction gradient test). *Thérapie* **16**: 384-392 (1961).

Djahanguiri, B., Sadeghi, D.: "Action préventive de l'acétazolamide sur l'ulcère de contrainte du rat blanc" (Preventive action of acetazolamide on restraint ulcers in white rats). *Acta Gastroenterol. Belg.* **31**: 689-692 (1968). G64,543/68

Levine, R. J., Senay, E. C.: "Histamine in the pathogenesis of stress ulcers in the rat." *Am. J. Physiol.* **214**: 892-896 (1968).

F96,913/68

Studies with brocresine (a potent inhibitor of histidine decarboxylase) and amino-guanidine (an inhibitor of diamine oxidase activity) "support the hypothesis that histamine plays an essential role in the pathogenesis of stress ulcers" produced in the rat by restraint and cooling.

Takagi, K., Okabe, S.: "An experimental gastric ulcer of the rat produced with anticholinergic drugs under stress." *Eur. J. Pharmacol.* **5**: 263-271 (1969).

H9,358/69

In rats the stress ulcers produced by immersion in cold water are prevented by atropine and other anticholinergic agents, but at the same time another type of ulcer appears in the proventriculus.

Brodie, D. A., Lotti, V. J., Bauer, B. G.: "Drug effects on gastric secretion and stress gastric hemorrhage in the rat." *Am. J. Dig. Dis.* **15**: 111-120 (1970). G73,656/70

Brodie, D. A., Hooke, K. F.: "The effect of vasoactive agents on stress-induced gastric hemorrhage in the rat." *Digestion* **4**: 193-204 (1971). H45,858/71

In rats, gastric hemorrhage induced by cold plus restraint is significantly inhibited by vasodepressors and aggravated by vasocon-

strictors (for example, vasopressin, angiotensin, NEP).

Hutcher, N., Silverberg, S. G., Lee, H. M.: "The effect of vitamin A on the formation of steroid induced gastric ulcers." *Surg. Forum* **22**: 322-324 (1971). J17,503/71

In rats, vitamin A significantly reduced methylprednisolone-induced gastric ulcers.

Frenkl, R.: "Humoral mechanism of ulcer-resistance of the organism adapted to physical exercise." *Acta Med. Acad. Sci. Hung.* **28**: 69-73 (1971). G87,952/71

In rats, stress ulcers of the stomach produced in various ways can be prevented with injections of the serum of sportsmen engaged in regular exercise. Inhibition of histamine-stimulated gastric secretion, or of the hypothalamus-pituitary-adrenocortical mediation of stress, is thought to be involved in this antiulcerogenic effect of the serum.

Mullane, J. F., Ritchie, W. P. Jr., Solis, R. T., Wilfong, R. G., Fischer, R. P.: "Experimental biliary obstruction and stress ulcer formation." *J. Surg. Res.* **12**: 180-184 (1972). G96,117/72

In rats the acute stress of restraint in conjunction with liver damage secondary to biliary obstruction produces particularly pronounced ulcers, which are prevented by vagotomy and (to facilitate emptying of the stomach) by pyloroplasty. "The gastric congestion that occurs in the patients with Laennec's and biliary cirrhosis may make their stomachs more susceptible to stress."

Ritchie, W. P. Jr., Roth, R. R., Fischer, R. P.: "Studies on the pathogenesis of 'stress ulcer': effect of hemorrhage, transfusion, and vagotomy in the restrained rat." *Surgery* **71**: 445-451 (1972). G89,104/72

"Restraint-induced ulcers in the rat resemble posttraumatic 'stress ulcers' in man in that they are acute and multiple, occur mainly in the stomach, are confined to the oxyntic cell area, and are not associated with gastric acid hypersecretion." The production of these ulcers is enhanced by hemorrhage and greatly diminished by vagotomy.

Voitk, A. J., Chiu, C. J., Gurd, F. N.: "Prevention of porcine stress ulcer following hemorrhagic shock with elemental diet." *Arch. Surg.* **105**: 473-476 (1972). G93,148/72

In pigs, "prefeeding with the predigested elemental diet protected the gastric mucosa

from the stress ulcers that occurred in nine of ten of the controls."

Requena, R., Forte, R., Knopf, M., Scherrer, J., Kirschner, J., Levowitz, B. S.: "Intracellular potassium and vitamin A in the prevention of stress ulcers." *Surg. Forum* **23**: 388-389 (1972). J21,575/72

Ferguson, W. W., Starling, J. R., Wangenstein, S. L.: "Role of lysosomal enzyme release in the pathogenesis of stress-induced gastric ulceration." *Surg. Forum* **23**: 380-382 (1972). J21,574/72

Restraint-induced gastric ulcers in the rat are accompanied by a reduction of the lysosomal enzyme, cathepsin D, from the gastric mucosa. Methylprednisolone diminishes the stress ulcers and prevents cathepsin D release. "Thus, lysosomal enzymes appear to play a role in the pathogenesis of stress ulcerations."

Perkins, W. E., Vars, L.: "Effects of carbenoxolone sodium on stress-induced gastric damage in rats." *Br. J. Pharmacol.* **47**: 847-849 (1973). H69,528/73

Intraperitoneal carbenoxolone offered significant protection against restraint-induced gastric ulcers in fed, but not in fasted rats.

Goodman, A. A., Osborne, M. P.: "Stress ulcer. A definition, a discussion of other stress-associated upper gastrointestinal lesions, and an experimental model." *Am. J. Surg.* **125**: 461-463 (1973). J2,449/73

Stress ulcers produced in piglets by hemorrhage could not consistently be prevented by vagotomy and pyloroplasty, despite reduction of gastric acid.

Osumi, Y., Takaori, S., Fujiwara, M.: "Preventive effect of fusaric acid, a dopamine- β -hydroxylase inhibitor, on the gastric ulceration induced by water-immersion stress in rats." *Jap. J. Pharmacol.* **23**: 904-906 (1973). H82,948/73

Earlier observations have shown that EP and NEP can inhibit the production of stress ulcers in the stomach of the rat. It has also been noted that most α -adrenergic blocking agents as well as the release of endogenous monoamines by reserpine and tetrabenazine aggravate these lesions, while β -adrenergic blockade inhibits them. In the present experiments, rats immobilized in restraint cages were immersed up to the xyphoid in water at 21°C, causing gastric ulceration within three hours. Tetrabenazine prior to the stress aggravated ulcer

production and elicited a decrease in NEP and dopamine content. Fusaric acid (5-butylpicolinic acid), a potent inhibitor of dopamine- β -hydroxylase, exerted an anti-ulcerogenic effect, presumably due to a decrease in the release of NEP from the CNS.

Rasche, R., Butterfield, W. C.: "Vitamin A pretreatment of stress ulcers in rats." *Arch. Surg.* **106**: 320-321 (1973).

J641/73

Studies on rats that received 10,000 international units of vitamin A prior to an eight-hour period of immobilization in a wire gauze device suggest that this vitamin "exerts a negligible, if any, protective effect on the occurrence of gastric ulceration."

Sibilly, A., Krivošić, I., Foucher, G., Fresnel, P. L., Boutelier, P.: "Prevention locale de l'ulcère gastrique expérimental. (Etude préliminaire)" (Topical prevention of experimental gastric ulcer [Preliminary study]). *J. Chir. (Paris)* **106**: 521-534 (1973).

J10,151/73

In rats the stress ulcers produced by restraint are aggravated by fasting and prevented by oral administration of glucose or aluminum gel. Neutralization of the gastric acid does not seem to be decisive, since aluminum gel protects less than hypertonic glucose; perhaps the latter helps to maintain cell metabolism and the gastric barrier.

Lindenbaum, E. S., Diamond, B., Yaryura-Tobías, J. A.: "Nicotinic acid and restraint induced ulcers." *Acta Physiol. Lat. Am.* **23**: 288-292 (1973).

J9,059/73

In rats, gastric ulcers produced by restraint with food and water deprivation are more effectively inhibited by nicotinic acid than by chlorpromazine.

Schumpelick, V., Paschen, U.: "Vergleich der protektiven Wirkung von Diazepam und Vagotomie auf das Stressulkus der Ratte" (Comparison of the protective activity of diazepam and vagotomy on stress ulcers in rats). *Arzneim. Forsch.* **24**: 176-179 (1974).

H82,750/74

In rats, stress ulcers (produced by restraint) can be inhibited by diazepam pretreatment or vagotomy, but combined application of these agents offers the best protection. "This fact demonstrates a different mode of action. The antiulcerative effect of diazepam is explained by its direct action on the vegetative regulation centers in the hypothalamic and limbic system, leading

to a partial inhibition of the vagally controlled HCl-pepsin component and the splanchnic nerve-dependent vascular factor of ulcerogenesis as well."

Lippmann, W.: "Oral gastric acid secretion-inhibitory activity and anti-ulcer activity of synthetic prostaglandin analogues: C-15 epimers of 15-hydroxy-15-methyl-9-oxoprostanic acid (AY-22,469)." *Prostaglandins* **7**: 223-229 (1974).

J16,177/74

Lippmann, W.: "Inhibition of gastric acid secretion and ulcer formation in the rat by orally-administered 11-deoxyprostaglandin analogues: 15-hydroxy-16,16-dimethyl-9-oxo-prost-5,13-dienoic acids." *Prostaglandins* **7**: 231-246 (1974).

J16,178/74

Ravokatra, A., Nigeon-Dureuil, M., Ratsimamanga, A. R.: "Action d'un triterpénoïde pentacyclique, l'asiaticoside, retirée de *Hydrocotyle Madagascariensis* ou *Centella asiatica*, contre les ulcéractions gastriques du rat Wistar, exposé au froid à + 2°" (The effect of asiaticoside, a pentacyclic triterpenoid, isolated from *Hydrocotyle Madagascariensis* or *Centella asiatica*, on gastric ulcers of Wistar rats exposed to cold at + 2°). *C. R. Acad. Sci. [D]* (Paris) **278**: 1743-1746 (1974).

J12,423/74

Asiaticoside inhibits the development of stress ulcers in rats exposed to cold.

Ravokatra, A., Loiseau, A., Ratsimamanga-Urverg, S., Nigeon-Dureuil, M., Ratsimamanga, A. R.: "Action de l'asiaticoside (triterpène pentacyclique) retiré de l'*Hydrocotyle Madagascariensis* sur les ulcères duodénaux créés par la mercaptoéthylamine chez le rat Wistar mâle" (The effects of asiaticoside [pentacyclic triterpene] extracted from *Hydrocotyle Madagascariensis* on mercaptoethylamine-induced duodenal ulcers in the male Wistar rat). *C. R. Acad. Sci. [D]* (Paris) **278**: 2317-2321 (1974).

J13,441/74

In rats, cysteamine-induced duodenal ulcers can be prevented by asiaticoside. This compound exerts a similar protective effect against peptic ulcers caused by stress.

Bates, R. F. L., Barlet, J. P.: "The preventative effect of porcine calcitonin given by mouth on restraint-induced gastric ulcer in rats." *Horm. Metab. Res.* **6**: 332-333 (1974).

H90,741/74

In rats, restraint-induced gastric ulcers can largely be prevented by calcitonin.

Norton, L., Mathews, D., Avrum, L., Eisenman, B.: "Pharmacological protection against swine stress ulcer." *Gastroenterology* **66**: 503-508 (1974). J12,432/74

In pigs, hemorrhagic shock induces stress ulcers in the stomach that can be prevented by cholestyramine (which binds bile acids), methysergide (a 5-HT antagonist), and methylprednisolone, but only under certain conditions of dosage and timing. Thus the clinical usefulness of this approach is problematic.

Cheney, D. H., Slogoff, S., Allen, G. W.: "Ketamine-induced stress ulcers in the rat." *Anesthesiology* **40**: 531-535 (1974).

J13,522/74

Restraint produced stress ulcers in rats, whereas at the dose levels given ketamine alone did not, but it did increase the incidence of restraint-induced ulcers from 35 to almost 100 percent. This sensitization was counteracted by phenoxybenzamine and halothane, "suggesting that the action of ketamine is mediated by vasoconstriction. Antihistamine pretreatment with promethazine was without effect."

Seiser, R. L., Houser, V. P.: "Effects of scopolamine methylbromide on shock-induced gastric lesions in the unrestrained rat." *Physiol. Behav.* **13**: 147-151 (1974).

J14,551/74

In rats the incidence and severity of gastric ulcers produced by the stress of electroshock avoidance conflict can be significantly decreased by pretreatment with the anticholinergic agent scopolamine methylbromide.

Cheney, C. D., Rudrud, E.: "Prophylaxis by vitamin C in starvation induced rat stomach ulceration." *Life Sci.* **14**: 2209-2214 (1974) (16 refs.). J14,496/74

Dai, S., Ogle, C. W.: "Gastric ulcers induced by acid accumulation and by stress in pylorus-occluded rats." *Eur. J. Pharmacol.* **26**: 15-21 (1974). H85,051/74

In pylorus-ligated rats, restraint decreased the volume and total acid output of gastric secretion. This type of "stress ulceration was prevented only by atropine, but not by antacids or adrenoceptor blocking agents. Increase in gastric motility during stress appears to cause these ulcers." Conversely, the proventricular ulcers produced by pyloric occlusion alone were prevented by atropine and antacids, suggesting their causation by gastric juice.

Moritz, E., Zacherl, H., Onderscheka, K., Helsberg, A.: "Vitamin A und Stressulkus-Prophylaxe" (Vitamin A and prevention of stress ulcers). *Bruns Beitr. Klin. Chir.* **221**: 208-221 (1974). J13,239/74

In rats the incidence of endotoxin-induced stress ulcers of the stomach can be reduced by vitamin A. Despite virtually unchanged plasma and liver levels, the vitamin content of the gastric wall was significantly increased after treatment.

Hemmati, M., Abtahi, F., Farrokhshiar, M., Djahanguiri, B.: "Prevention of restraint and indomethacin-induced gastric ulceration by bile duct or pylorus ligation in rats." *Digestion* **10**: 108-112 (1974). H87,920/74

In rats, restraint- and indomethacin-induced gastric ulcers were prevented by bile duct or pylorus ligation. This protection was abolished by bile administration. Presumably, the presence of bile in the stomach is necessary for the development of this type of ulcer.

Konturek, S. J., Radecki, T., Demitrescu, T., Kwiecień, N., Pucher, A., Robert, A.: "Effect of synthetic 15-methyl analog of prostaglandin E₂ on gastric secretion and peptic ulcer formation." *J. Lab. Clin. Med.* **84**: 716-725 (1974). J18,035/74

"In conscious cats with chronic gastric and pancreatic fistulas, a synthetic 15-methyl analog of prostaglandin E₂, 15/S/15-methyl-E₂-methyl ester, caused a dose-related inhibition of maximal gastric acid and pepsin response to pentagastrin and histamine." These antisecretory and antiulcerogenic effects may be of therapeutic value in man.

Yeomans, N. D., St. John, D. J. B.: "Effect of carbenoxolone sodium on aspirin-induced injury of the rat gastric mucosa." *Am. J. Dig. Dis.* **19**: 217-222 (1974). J12,310/74

Although carbenoxolone protects the rat against stress ulcers (restraint), it does not prevent erosions produced by aspirin.

Emerson, L., Kerkut, G. A.: "Effect of oral administration of degraded carrageenan on the induction of gastric ulcers in rats treated with glucocorticoids." *J. Comp. Pathol.* **84**: 151-159 (1974). J13,062/74

Discussion of the literature concerning the relationship between gastric ulcers produced by stressors and those caused by glucocorticoids. In fasted rats, fluocortolone, difluocortolone, and difluocortolone trimethyl acetate

elicited gastric ulcers that could be inhibited by oral carrageenan.

Shirazi, S. S., Paluska, G., Zike, W. L.: "The role of dexamethasone and 5-fluorouracil in the prevention of stress ulcers" (abstract). *Clin. Res.* **22**: 369A (1974).

H90,255/74

In dogs, gastric "stress ulcers" produced by the combination of bile salts and hemorrhage were not improved by dexamethasone or 5-fluorouracil.

Schumpelick, V., Kauffmann-Mackh, G.: "Der Einfluss des N. Vagus auf die Ulkusentstehung bei portokavalen Anastomose der Ratte" (The influence of the vagus nerve on ulcer formation in rats with portacaval anastomosis). *Brunn's Beitr. Klin. Chir.* **221**: 239-246 (1974).

J13,241/74

In rats with portacaval anastomosis, multiple ulcers occurred following pylorus ligation because of vagal stimulation. This could largely be inhibited by vagotomy, which also diminished the quantity and acidity of the gastric juice (32 refs.).

Mullane, J. F., Pyant, R. L. Jr., Wilfong, R. G., Dailey, W.: "Starvation, glucose and stress ulcers in the rat." *Arch. Surg.* **109**: 416-419 (1974).

H16,378/74

In rats, restraint produces stress ulcers especially during fasting. This effect can be counteracted by oral glucose. "These studies suggest that a critically low glucose or caloric intake may account in part for gastric lesions in the stressed patient."

Wilson, D. E.: "Prostaglandins and stress ulcers." *Prostaglandins* **8**: 52-53 (1974).

J18,078/74

Zike, W. L., Safae-Shirazi, S., Denbesten, L.: "The role of cholestyramine in the prevention of stress ulcers." *J. Surg. Res.* **17**: 315-319 (1974).

J19,651/74

In dogs, stress ulcers produced by hemorrhagic shock plus intragastric instillation of hydrochloric acid and bile salts can be prevented by cholestyramine.

Daturi, S., Franceschini, J., Mandelli, V., Mizzotti, B., Usardi, M. M.: "A proposed role for PGE₂ in the genesis of stress-induced gastric ulcers." *Br. J. Pharmacol.* **52**: 464P (1974).

H97,097/74

Kawarada, Y., Weiss, R., Matsumoto, T.: "Pathophysiology of stress ulcer and its prevention. I. Pharmacologic doses of steroid." *Am. J. Surg.* **129**: 249-254 (1975).

J23,615/75

Decadron (a potent glucocorticoid) given before restraint prevents gastric ulcer formation in the rat.

Kawarada, Y., Lambek, J., Matsumoto, T.: "Pathophysiology of stress ulcer and its prevention. II. Prostaglandin E₁ and microcirculatory responses in stress ulcer." *Am. J. Surg.* **129**: 217-222 (1975).

J21,536/75

Prostaglandin E₁ completely prevented the formation of stress ulcers in the rat but only in doses which were toxic (17 refs.).

Ulcerative Colitis

There appears to be fairly unanimous agreement that, in children as well as in adults, ulcerative colitis is often related to stressful life situations. In children, it seems to be associated with aggressive emotions, especially against parents. In adults, stressful situations in the family or on the job appear to be of pathogenic importance, as is grief for real or fantasized objects of loss. Among nomadic Arabs, ulcerative colitis has often been noted upon settlement in Kuwait City, presumably owing to the sudden shift from simple country to complicated urban life. Allegedly, glucocorticoids are of therapeutic value but this claim has not yet received adequate confirmation.

Ulcerative Colitis

(See also our earlier stress monographs, p. xiii)

Groen, J.: "Psychogenesis and psychotherapy of ulcerative colitis." *Psychosom.*

Med. **9**: 151-174 (1947).

B27,185/47

C15,608/56

Fullerton, D. T., Kollar, E. J., Caldwell, A. B.: "A clinical study of ulcerative colitis." *J.A.M.A.* 181: 463-471 (1962).

D38,251/62

Ulcerative colitis is frequently caused by psychogenic stress. It "occurs in persons with immature or defective egos after real or fantasized object loss and may be viewed as a morbid grief reaction."

Brown, C. H.: "Acute emotional crises and ulcerative colitis. Report of seven cases." *Am. J. Dig. Dis.* 8: 525-536 (1963).

J23,463/63

"Dramatic and shocking emotional stress immediately preceded the onset of ulcerative colitis in 6 patients, and initiated a flare-up in a seventh. The emotional situations and case histories are presented. The onset of ulcerative colitis immediately after such severe emotional trauma suggests that psychogenic factors may be etiologic in some patients" (46 refs.).

Kollar, E. J., Fullerton, D. T., Censo, R. di, Agler, C. F.: "Stress specificity in ulcerative colitis." *Compr. Psychiatry* 5: 101-112 (1964).

J22,977/64

Jackson, D. D., Yalom, I.: "Family research on the problem of ulcerative colitis." *Arch. Gen. Psychiatry* 15: 410-418 (1966).

J8,775/66

Ulcerative colitis appears to be especially common in families that live a socially restricted, over-disciplined and traditional life. However, "it is also important not to overlook the possibility that a chronically ill child is the source of the stress rather than one of its products."

Fazlullah, S.: "Idiopathic ulcerative colitis in tropics. Its pattern and clinical course (A preliminary report)." *Medicus* (Karachi) 33: 13-40 (1966).

F74,076/66

General review on "idiopathic ulcerative colitis" as it occurs in the tropics. Special emphasis is placed upon stress, malnutrition and poor hygienic conditions in its pathogenesis, and glucocorticoid therapy is discussed.

Salem, S. N., Shubair, K. S.: "Non-specific ulcerative colitis in Bedouin Arabs." *Lancet* March 4, 1967, pp. 473-475.

F77,588/67

Ulcerative colitis has been noted in Bedouin and other nomadic Arabs after settlement in Kuwait city. Presumably, "the

sudden shift from a simple life to a complicated one predisposes these people to the disease."

Davidson, M.: "Juvenile ulcerative colitis." *N. Eng. J. Med.* **277**: 1408-1410 (1967). F92,345/67

A review of juvenile ulcerative colitis suggests that it may be emotional in origin, but this view is less enthusiastically supported than it was a few decades ago.

Mendeloff, A. I., Monk, M., Siegel, C. I., Lilienfeld, A.: "Illness experience and life stresses in patients with irritable colon and with ulcerative colitis. An epidemiologic study of ulcerative colitis and regional enteritis in Baltimore, 1960-1964." *N. Engl. J. Med.* **282**: 14-17 (1970). H20,041/70

In the Baltimore area, "subjects with irritable colon had consistently higher scores for various social-cultural factors thought to represent life stresses than either the patients with ulcerative colitis or the general population. The group with ulcerative colitis resembled the general population in this respect, except for being significantly more Jewish." Specific stressor events preceding the outbreak of the disease could not be established, and hence these "studies fail to

support the thesis that ulcerative colitis is a paradigm of psychosomatic illness."

Monk, M., Mendeloff, A. I., Siegel, I., Lilienfeld, A.: "An epidemiological study of ulcerative colitis and regional enteritis among adults in Baltimore. III. Psychological and possible stress-precipitating factors." *J. Chron. Dis.* **22**: 565-578 (1970).

"*Rumination*" in human neonates is the regurgitation and renewed mastication of food, subsequently swallowed again. It is ascribed to psychogenic stress which depends mainly upon the mother's attitude toward the baby (34 refs.).

CARDIOVASCULAR DISEASES (INCLUDING HYPER-TENSION, CARDIAC INFARCTS, PERIARTERITIS NODOSA)

[See also Psychosomatic Diseases, Occupations, Stress Tests, and other sections where cardiovascular changes are likely to play an important role]

Generalities

The cardiovascular diseases in the pathogenesis of which stress appears to play an important role will be discussed conjointly because many of them usually occur in combination (for example, hypertension, arteriosclerosis, myocardial infarcts).

It is difficult to classify the factors involved in the causation of stress-induced cardiovascular disease because of similar overlaps. For example, various stressors may

result in hypertension or cardiac infarction, yet psychogenic stress plays such a preponderant role that it deserves to be discussed in a special section. The conditioning factors that predispose to cardiovascular disease likewise overlap. Undoubtedly, genetic factors are important in determining behavior, the choice of an occupation, the site of residence (urban, rural), or even the type of diet. On the other hand, age, at least the chronologic age of an individual, though a highly important conditioning factor determining predisposition for cardiovascular disease, is largely independent of those just mentioned. Finally, the various indices of stress and cardiovascular disease (pathologic anatomy, chemical changes, blood coagulability) have not only diagnostic value, but also furnish significant data on probably important pathogenetic factors.

Although recognizing the unavoidable overlap in my classification, I feel it is better to list the literature in some more or less logical predetermined order to facilitate orientation; hence, despite its arbitrary nature, I have decided to use the following subdivisions:

- History
- Stressors
 - General
 - Psychogenic
- Conditioning
 - Genetics
 - Diet
 - Occupation, Social Factors including Urbanization
 - Age
- Diagnostic Indicators and Other Changes Characteristic of Stress-induced Cardiovascular Disease
 - Stress Tests
 - Morphology
 - Blood Clotting
 - Hormones
 - Nonhormonal Metabolites
- Experimental Cardiovascular Diseases
 - Hypertension, Arteriosclerosis
 - Hyalinos
 - Infarctoid Necrosis
 - Adrenal Regeneration Hypertension

For a general overview of the subject, the reader is referred to the reviews and monographs listed below.

Generalities

Selye, H.: "Stress and cardiovascular disease." *Jubilee Volume in Honor of V. V. Parin* (In press) (Russian). G88,057/

Review on the relationship between stress and cardiovascular disease with special reference to infarctoid necrosis and mineralocorticoid hypertensive disease.

History

Some of the earliest data on stress-induced cardiovascular diseases were mentioned in the section on History. Suffice it to point out here that as early as 1812, Corvisart expressed the view that cardiac disease depends upon the "passions of man" and that the heart can be injured by such efforts as fencing, wrestling, playing wind instruments or emotional arousal associated with anger, fear or despair.

However, it was not until recent times that special attention was given to statistical

studies that would prove the relationship between the stressors of daily life (especially extreme muscular effort), traumatic injuries or intense emotional arousal.

Animal experiments have shown that, following suitable pretreatment, exposure to virtually any severe stressor can precipitate myocardial necroses or hypertensive vascular disease. In other words, here again we are dealing with complex pathogenic situations in which both the conditioning or predisposing factors that induce disease-proneness and the eliciting stressors play equally important roles.

History

(See also our earlier stress monographs, p. xiii)

Corvisart, J. N.: *An Essay of the Organic Diseases and Lesions of the Heart and Great Vessels*. Boston: Bradford and Read, 1812.

E3,955/1812

All heart diseases stem "from the action of the organ and from passions of man." The heart can be injured by crying in infancy, wrestling, fencing, playing wind instruments, laughing, weeping, reading, declamation, anger, madness, fear, jealousy, terror, love, despair, joy, avarice, cupidity, ambition, revenge, and every kind of effort. However, "to conceive man without passions, is to conceive a being without his attributes."

G70,422/71

Review of the evolution of the stress concept, with special reference to experimental models of cardiovascular disease in which stress plays an important role.

Stressors in General

The literature amply illustrates the fact that, in predisposed patients, myocardial infarcts can follow extracardiac surgical interventions and a variety of other physical and mental stressors. There may be a latency period between the stress and the myocardial infarction. Unaccustomed efforts are particularly harmful, which illustrates the importance of adaptation. This is true in both human and experimental pathology.

Similar observations have been made concerning the development of hypertension. Even in workers exposed to continuous industrial noise, the blood pressure shows a great tendency to reach high values and ECG changes have been noted.

Stress may play a role even in the production of endocarditis in that glucocorticoids decrease resistance to infection and catecholamines increase the demands made upon the cardiac valves by raising the blood pressure.

Evaluation of the literature suggests that various stressors may play a pathogenic role in cardiovascular disease (24 refs.).

White, P. D.: "The relation of heart disease to injury, stress and occupation." In: Bisteni, A., Fishleder, B. L. et al., *Cardiologia*, pp. 43-47. Mexico: Editorial Interamericana, 1961. D31,194/61

Cardiac infarcts are precipitated by physical or mental stress only in patients predisposed by preexistent cardiac disease.

Sparkman, D. R.: "Trauma or strain and heart disease. Causal relationship." *Calif. Med.* **94**: 72-76 (1961). D1,913/61

To clarify the problems of the cardiac patient under workmen's compensation laws, a special committee of the Washington State Heart Association reasoned that a "causal relationship of trauma to heart disease may exist under the following circumstances: Sudden death from acute coronary disease (or coronary occlusion with myocardial in-

farction, or acute coronary insufficiency) in which symptoms develop during the course of or immediately following exertion or strain that is both excessive and unusual for the particular individual concerned; this exertion or strain may be either physical or emotional." In the years 1950 to 59, 77 percent of all the claims for cardiac damage made in the state of Washington were for myocardial infarction or acute coronary insufficiency following unusual effort. Since CHD is progressive, it is difficult to ascertain when a given stress at work may have contributed to an eventual infarct. Data are reviewed on steps taken by several states concerning a causal relationship between stress and heart disease (20 refs.).

Shatalov, N. N., Saitanov, A. O., Glotova, K. V.: "On the state of the cardiovascular system under conditions of exposure to continuous noise." *Gig. Tr. Prof. Zabol.* **6**: 10-14 (1962). J6,200/62

"In persons exposed to the effect of continuous industrial medium-frequency and high-frequency noise of intensity 85 to 120 db, functional disturbances of the cardiovascular system were frequently observed. Very often the subjects exhibited an instability of the arterial blood pressure. The electrocardiographic data showed bradycardia with a tendency to retardation of the intravesicular conductivity, plus a depression of the T-wave that was most frequently observed after physical stress and at the end of the work-period."

Psychogenic Stressors

In man, probably because of his highly developed CNS, psychogenic stressors are among the most frequent causes of cardiovascular disease. A large number of published observations suggest that tensions and threats arising from interpersonal relations in the family or at work are particularly apt to cause hypertension, whereas cardiac infarcts are more often the result of acute, intense mental arousal. In predisposed subjects, events causing anxiety and resentment increase the pulse rate, cardiac output and blood pressure. At the same time, tolerance to exercise is impaired. However, in the few instances when stress has evoked dejection and despair, the cardiovascular response was a hypodynamic one with bradycardia, decreased blood pressure and hypotension.

There appears to be little doubt that emotional stress is one of the most frequent factors in the development of high blood pressure, congestive heart failure or cardiac infarction in predisposed patients. Violent arguments with superiors or members of the family, as well as witnessing a serious car accident or lifting a heavy weight, may cause ventricular tachycardia, paroxysmal auricular tachycardia, complete heart block and even sudden death. In fact, both physical and emotional exhaustion can provoke virtually all types of cardiac arrhythmias (and death) in the normal as well as the abnormal heart.

The many statistical studies conducted in this field show that cardiovascular derangements as well as other diseases of adaptation depend not so much upon the kind of demand made on an individual as upon his reaction to it. There has been much argument about whether executives or subordinates are more subject to stress-induced cardiovascular disease but there appears to be no uniformly applicable answer to this problem. The deciding factor is whether a person finds it more stressful to be responsible for giving orders or for having to obey them. In any event, it is obvious that in subjects under otherwise identical conditions, individual motivation and personality play a decisive role.

In this respect, two types of people have been distinguished: Type A subjects exhibit a behavior pattern characterized primarily by intense ambition, competitive drive, constant preoccupation with job deadlines, a sense of time urgency, restless motor mannerisms and staccato-style verbal responses, whereas Type B individuals

manifest a converse behavior. Sometimes, an additional Type C is recognized as having essentially the characteristics of Type B, but with the added element of chronic anxiety. Type A subjects usually have a high cholesterol level, a shortened blood clotting time and an increased tendency to develop coronary artery disease and arcus senilis. Allegedly, they succumb to coronary artery disease six times more frequently than do Type B individuals.

Friedman and Rosenman called attention to these two types and deserve the greatest credit for having clearly delineated them. However, the authors themselves are the first to point out that, during the nineteenth century, Sir William Osler described a behavior pattern typical of coronary-prone patients. If we accept the tenet that stress, like emotional responsiveness, is equally dependent upon life events and upon our reactions to them, it is evident that the distinction of Types A and B is essentially equivalent to admitting that stress, especially emotional stress, plays a decisive role in the pathogenesis of cardiovascular disease, and is more influential in those who respond to a given event intensely (that is with severe stress) than in unresponsive, phlegmatic persons. Of course, this concept is also very compatible with the hormonal theory in that the tense, excitable Type A person responds more readily with catecholamine and corticoid secretion than does Type B, as we shall see in the section on the role of endocrine responses.

One review of the literature suggests that among the stressors of modern life, fear, hatred, aggression and frustration increase catecholamine and particularly NEP secretion, as well as the plasma levels of FFA and triglycerides. They also augment platelet adhesiveness and hence can lead to thrombosis. It is suggested that "in modern society wrath, reinforced by sloth and gluttony, is the deadliest of the seven sins." Job satisfaction has also been claimed to be inversely related to death from CHD.

It may now be taken as indubitably established that psychogenic stress is a risk factor in myocardial infarction. Indeed, the American Academy of Psychosomatic Medicine formulated a resolution in 1973 "that psychosocial stresses must be included among the recognized high-risk factors in myocardial infarction" and "that the psychiatrist and psychosocial team be formally incorporated as an integral part of the Coronary Care Unit for every patient."

Alexander, F.: "Emotional factors in essential hypertension. Presentation of a tentative hypothesis." *Psychosom. Med.* 1: 173-179 (1939). B63,594/39

Discussion of essential hypertension as a psychosomatic disease (20 refs.).

Wolf, S., Pfeiffer, J. B., Ripley, H. S., Winter, O. S., Wolff, H. G.: "Hypertension as a reaction pattern to stress: summary of experimental data on variations in blood pres-

sure and renal blood flow." *Ann. Intern. Med.* 29: 1056-1076 (1948). B43,405/48

A review of the literature and personal observations led to the conclusion that "hypertension may represent an atavistic protective reaction of mobilization, invoked inappropriately by these subjects to deal with day-to-day stresses and threats arising out of problems of interpersonal relation. It becomes harmful and leads to illness when this essentially emergency pattern is adopted as a way of life" (42 refs.).

those with cardiovascular disease." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 799-817. Baltimore: Williams & Wilkins, 1950. B51,945/50

"In seventy subjects with a variety of cardiovascular complaints, life stress-evoking anxiety and resentment were met by cardiovascular mobilization. This was characterized by an increase in the heart rate and cardiac output and elevation of the blood pressure. In the few instances where the stress evoked depression and despair the cardiovascular response was a hypodynamic one, with a decrease in the heart rate and cardiac output and usually a lowering of the blood pressure. Tolerance to exercise was impaired during periods of anxiety and resentment related to life stress, with an exaggerated cardiovascular response to the exercise."

Chambers, W. N., Reiser, M. F.: "Emotional stress in the precipitation of congestive heart failure." *Psychosom. Med.* 15: 38-60 (1953).

G37,177/53

"Emotional stress is a frequent precipitating factor in the development of congestive heart failure in the patient with limited cardiac reserve."

Bernreiter, M.: "Cardiac arrhythmias in physical or emotional stress." *Mo. Med.* 53: 19-20 (1956).

C11,328/56

Case reports showing that violent arguments with superiors, witnessing a serious car accident, or lifting a heavy weight may cause ventricular or paroxysmal auricular tachycardia, complete heart block, and even death. It is concluded that "physical exertion and emotional stress may lead to almost all types of cardiac arrhythmias and death in the abnormal as well as the normal heart. An attempt is made to describe some of these phenomena that occur during the alarm reaction and their possible relationship to the production of ectopic rhythms."

Weiss, E., Dlin, B., Rollin, H. R., Fischer, H. K., Bepler, C. R.: "Emotional factors in coronary occlusion." *Arch. Intern. Med.* 99: 628-641 (1957).

C93,120/57

Studies on forty-three patients with CHD suggest that "among the multiple factors having to do with coronary occlusion, gradually mounting stress of emotional origin may be significant" (21 refs.).

Sprague, H. B.: "Emotional stress and the etiology of coronary artery disease." *Circulation* 17: 1-4 (1958).

C47,825/58

Brief editorial on emotional stress as an etiologic factor in the genesis of coronary artery disease.

Friedman, M., Rosenman, R. H.: "Association of specific overt behavior pattern with blood and cardiovascular findings. Blood cholesterol level, blood clotting time, incidence of arcus senilis, and clinical coronary artery disease." *J.A.M.A.* 169: 1286-1296 (1959).

C67,550/59

The effect of stress on the development of

CHD was studied in men with three distinct behavioral patterns. "Men of group A exhibited a behavior pattern primarily characterized by intense ambition, competitive 'drive,' constant preoccupation with occupational 'deadlines,' and a sense of time urgency and the men of group B, a converse behavior pattern. Men of group C exhibited a behaviour pattern essentially similar to that exhibited by men of group B, but with the added elements of a chronic anxiety state." An analysis of the results strongly suggested that "the behavior pattern exhibited by the men of group A was of itself largely responsible not only for their higher serum cholesterol and possible hastening of clotting time but also for their markedly increased incidence of both clinical coronary artery disease and arcus senilis."

Weinberg, S. B., Helpern, M.: "Circumstances related to sudden, unexpected death in coronary heart disease." In: Rosenbaum, F. F. and Belknap, F. L., *Work and the Heart*, pp. 288-292. New York: P B Hoeber, 1959.

Friedberg, C. K.: "Physical effort and the emotions in the genesis of coronary occlusion and myocardial infarction." In: James, T. N. and Keyes, J. W., *Henry Ford Hospital International Symposium: The Etiology of Myocardial Infarction*, pp. 427-440. Boston: Little, Brown, 1963.

E568/63

A brief review of the literature leads to the conclusion that "claims of a causal relation of effort and emotion to coronary thrombosis based on the latter's occurrence after a severe or unusual effort, a sudden emotional strain, a period of occupational stress or personal frustration or grief are not founded on adequately controlled observations and fail to exclude other possible factors." It is considered probable that the apparent increase in the incidence of coronary thrombosis during the past few decades is due to better diagnostic techniques. However, there is admittedly no scientific basis for excluding the role of effort and emotion in coronary thrombosis.

Pearson, H. E. S.: "Stress and occlusive coronary artery disease." *Am. Heart J.* **66**: 836-838 (1963).

E35,737/63

The term "stress" is derived from the Latin *stringere* (to draw tight), and hence it necessarily implies a constraining force, such as the grip of emotion. In a pilot investigation, such stresses were found to be greater in coronary patients than in controls.

Pearson, H. E. S.: "Stress and occlusive coronary-artery disease." *Lancet* February 23, 1963, pp. 415-418.

D57,816/63

In a small pilot study based on interviews, emotional stress was found to be significantly greater in coronary patients than in matched controls.

Review of research projects subsidized by the National Heart Institute of the U.S.A. between 1949 and 1965 to clarify the relationship between heart disease and emotional factors. An extensive section deals with animal experiments on the G.A.S. (over 200 refs.).

Hahn, P., Nüssel, E., Stieler, M.: "Psychosomatik und Epidemiologie des Herzinfarktes" (Psychosomatic and epidemiologic aspects of myocardial infarction). *Z. Psychosom. Med.* **12**: 229-253 (1966).

G57,680/66

Review on the epidemiology of myocardial infarction with special reference to the role of psychogenic stress in its pathogenesis.

Ostow, M.: "Orthostatic hypotension and psychic energizers: a clinical note." *Psychosomatics* **7**: 224-225 (1966). F68,735/66

After patients are treated with MAO inhibitors, both stressors and glucocorticoids combat the resulting orthostatic hypotension. Endogenous glucocorticoid liberation may have a therapeutic effect on this condition.

López-Ramírez, R.: "Factor psíquico en aterosclerosis" (Psychic factors in atherosclerosis). *Prensa Med. Argent.* **53**: 1190-1191 (1966). H4,474/66

Review of the literature indicating that emotional stress enhances the development of atherosclerosis.

Caffrey, B.: "A review of empirical findings." *Milbank Mem. Fed. Q.* **45** No. 2, Part 2: 119-139 (1967). G58,145/67

Review indicating that personality characteristics and individual responses to stressors in life situations are related to CHD. Experimental work, particularly on infarctoid myo-

cardial necroses elicited by stress, is also carefully considered (76 refs.).

Jenkins, C. D., Rosenman, R. H., Friedman, M.: "Development of an objective psychological test for the determination of the coronary-prone behavior pattern in employed men." *J. Chron. Dis.* **20**: 371-379 (1967). J5,580/67

A "coronary-prone behavior pattern, called Type A, is characterized primarily by excessive drive, aggressiveness, ambition, involvement in competitive activities, frequent vocational deadlines, pressure for vocational productivity, an enhanced sense of time urgency and restless motor mannerisms and staccato style of verbal response. The converse, low coronary-risk behavior pattern, called Type B, is characterized by the relative absence of this interplay of psychological traits and situational pressures. The Type B subject is relaxed and more easy going, seldom becomes impatient and takes more time to enjoy avocational pursuits. He is not easily irritated and works steadily, but without a feeling of being driven by a lack of time. He is not preoccupied with social achievement, and is less competitive in his occupational and avocational pursuits. He moves and speaks in a slower and more smoothly modulated style." Sir William Osler was one of the first to describe a typical behavior pattern in coronary-prone patients, and the types presently outlined can be further divided into subtypes (23 refs.).

Russek, H. I.: "Emotional stress in the etiology of coronary heart disease." *Geriatrics* **22**: 84-89 (1967). F86,596/67

CHD is most likely to occur under the influence of emotional stress in patients on high-fat diets.

Rosenman, R. H.: "Emotional factors in coronary heart disease." *Postgrad. Med.* **42**: 165-172 (1967). G50,093/67

Type A behavior predisposes to CHD, whereas type B behavior protects against it, because the former is much more stressful than the latter.

Sigler, L. H.: "Emotion and atherosclerotic heart disease. I. Electrocardiographic changes observed on the recall of past emotional disturbances." *Br. J. Med. Psychol.* **40**: 55-64 (1967). G49,523/67

"Repeated psychic trauma, in emotionally disturbed individuals, may be one of the underlying causes in the pathogenesis of athero-

sclerotic heart disease and in inducing an acute cardiac insult."

Friedman, M., Rosenman, R. H., Straus, R., Wurm, M., Kositchev, R.: "The relationship of behavior pattern A to the state of the coronary vasculature. A study of fifty-one autopsy subjects." *Am. J. Med.* **44**: 525-537 (1968). J8,971/68

Among more than three thousand men enrolled in a prospective study, fifty-one autopsies were performed to determine the possible relationship between atherosclerosis and behavior during life. "It was found that subjects who while living exhibited a particular behavior pattern (type A) succumbed to coronary artery disease six times more frequently than subjects who exhibited a converse pattern (type B) during their life. The former subjects also exhibited, irrespective of the actual cause of death, severe basic coronary atherosclerosis six times more frequently than the latter subjects." The coronary patients also exhibited a higher "serum cholesterol, triglyceride and beta:alpha lipoprotein ratio than those who died of extracardiac causes."

Mai, F. M. M.: "Personality and stress in coronary disease." *J. Psychosom. Res.* **12**: 275-287 (1968). G63,266/68

Review on the roles of personality and emotional stress in the pathogenesis of coronary disease.

Iglesias, E. H.: "Emoción, angustia, e infarto de miocardio" (Emotion, anxiety, and myocardial infarction). *Galicia Clín.* **40**: 873-882 (1968). G64,509/68

Review of the stress theory of myocardial infarction.

Gonin, A., Aimard, G., Froment, R.: "Role des facteurs neuro-psychiques dans l'expression de la maladie coronarienne constituée" (Role of neuropsychic factors in established coronary disease manifestations). *Coeur Med. Interne* **7**: 265-290 (1968). H861/68

Review of the literature on the role of neuropsychiatric stressors in coronary disease, particularly angina pectoris.

Umidova, Z. I., Arifdzhhanov, A. A., Budianskii, M. V., Korolev, G. P., Tarapata, N. P., Abdullaeva, S. V.: "The picture of arterial hypertension during the Tashkent earthquake." *Ter. Arkh.* **41** No. 6: 38-40 (1969) (Russian). J25,191/69

"The authors saw increase of arterial hy-

pertension during the Tashkent earthquake and believe it to be due first of all to the change of meteorological factors and psycho-emotional stress."

Richter-Heinrich, E., Sprung, H.: "Psychophysiologische Untersuchungen im Anfangsstadium der essentiellen Hypertonie" (Psychophysiological studies of the initial stage of essential hypertension). *Z. Gesamte Inn. Med.* **24**: 17-21 (1969). J21,996/69

Heyden, S.: "Environmental factors." In: Schettler, F. G. and Boyd, G. S., *Atherosclerosis*, pp. 587-631. Amsterdam, London and New York: American Elsevier, 1969.

E8,021/69

The role of emotional factors in CHD is still considered doubtful. A review of available data fails to offer definite proof, especially if animal experiments are disregarded. Besides, the best that man can do is to learn to live with stress, since it is unavoidable in normal life.

Morris, J. N., Gardner, M. J.: "Epidemiology of ischaemic heart disease." *Am. J. Med.* **46**: 674-683 (1969). G67,204/69

Extensive review on the social and medical implications of ischemic heart disease, which is particularly common among men "showing strong drive, competitiveness, time urgency and preoccupation with deadlines, and the frustrations attendant on these" (Type A). This is true especially in early middle age, and results in particularly fatal disease. The incidence is twice that among Type B patients, who do not exhibit such personality traits.

Carruthers, M. E.: "Aggression and atheroma." *Lancet* November 29, 1969, pp. 1170-1171. H19,421/69

Evaluation of the literature shows that various stresses of daily life, especially fear, hatred, aggression and frustration, increase catecholamine and particularly NEP secretion, as well as the plasma levels of FFA and triglycerides. The latter can be deposited in vessel walls, and since they also augment platelet adhesiveness, may lead to thrombosis. "This hypothesis suggests that in modern society wrath, reinforced by sloth and gluttony, is the deadliest of the seven sins."

Zyzanski, S. J., Jenkins, C. D.: "Basic dimensions within the coronary-prone behavior pattern." *J. Chron. Dis.* **22**: 781-795 (1970). J8,980/70

The JAS identifies men with a coronary-prone behavior pattern (Type A) with about 70 percent accuracy. This behavior pattern is composed of at least three independent behavioral syndromes: (1) Hard Driving Temperament, (2) Job Involvement, (3) Speed and Impatience. "A system was constructed for deriving factor scores for individuals on these dimensions, and these scores were demonstrated to be reliable across forms of the test and stable over time. The 3 scores were uncorrelated with each other."

Koster, M., Musaph, H., Visser, P. (eds.): *Psychosomatics in Essential Hypertension*, p. 189. Biblio. Psychiatry No. 144. Basel and New York: S. Karger, 1970. E10,095/70

International symposium organized by the Dutch Society for Psychosomatic Research in 1968. Such topics as the methodology of blood pressure measurements, the role of emotional stress, and various psychosomatic aspects of disease were covered in eight presentations, each followed by a discussion.

Bellet, S., Roman, L.: "Stress electrocardiography in the diagnosis of arrhythmias." *Geriatrics* 25: 102-107 (1970).

H31,290/70

Emotional stress precipitates arrhythmias in predisposed patients, presumably because of the release of catecholamines and cortisol.

Bersay, C.: "Infarctus du myocarde et facteurs psycho-somatiques" (Myocardial infarct and psychosomatic factors). *Coeur Méd. Interne* 9: 323-326 (1970).

- A statistical study based on questionnaires led to the conclusion that what counts in the production of CHD "may not be the amount of situational or intrapsychic stress a person is subjected to but the way he copes with it—his defensive style" (28 refs.).
- Wardwell, W. I.: "A study of stress and coronary heart disease in an urban population." *Bull. N.Y. Acad. Med.* **49**: 521-531 (1973). J3,167/73
- Statistical studies, based mainly on ques-

tionnaires about subjective criteria and life habits, support the "contention that a coronary-prone behavior pattern predicts the incidence of coronary heart disease in white males." The decisive factor may be that coronary candidates have an unusually strong "tendency to somaticize affect: that is, the proclivity on the part of some people in contradistinction to others to translate psychological and situational tensions, conflicts, and frustrations in bodily symptoms. The variety of ways in which such stresses are expressed appear to include restless activity, ambitious strivings, bodily symptoms of many different sorts, and pathogenic atherosclerotic and thrombotic processes."

Somerville, W.: "Emotions, catecholamines and coronary heart disease." *Adv. Cardiol.* **8**: 162-173 (1973). J16,987/73

A statistical study shows that "certain experienced motor-car drivers with a history of coronary heart disease when driving in busy traffic develop angina, sinus tachycardia, ectopic beats and various arrhythmias. Healthy racing drivers stimulated by the emotions of competition and danger, develop high-grade sinus tachycardia, raised plasma catecholamines and free fatty acids immediately before and after a race. Public speaking induces in normal persons similar changes in heart rate and rhythm and elevations in plasma catecholamines and free fatty acids. In both drivers and public speakers, triglycerides show a peak elevation 1-2 h after the event. Oxyphenol inhibits the increase in heart rate, plasma catecholamines, free fatty acids and triglycerides."

Pfanz, M.: "Psychische und soziale Faktoren bei der Entstehung des Hochdrucks" (Importance of mental and social factors in the genesis of hypertension). *Internist* (Berlin) **15**: 124-128 (1974). H86,142/74

Review of hypertension as a disease largely dependent upon stress, particularly social maladjustment (29 refs.).

Vlachakis, N. D., Schiavi, R., Mendlowitz, M., Guia, D. de, Wolf, R. L.: "Hypertension and anxiety." *Am. Heart J.* **87**: 518-526 (1974). H85,440/74

Liesse, M., Imschoot, K. van, Mertens, C., Lauwers, P.: "Caractéristiques psychologiques et réactions physiologiques au stress de sujets normaux et coronariens" (Psychologic characteristics and physiologic reactions to stress in normal and coronary-prone subjects). *J. Psychosom. Res.* **18**: 49-53 (1974). J12,478/74

From various psychologic tests, it is concluded that "patients with ischemic heart disease do not show an exclusive coronary-prone personality pattern. Different patterns can be identified among them. The common psychological coronary-prone component of these different patterns seems to be the incapacity to cope with anxiety or the inadequacy of their defense-mechanisms."

Corbalan, R., Verrier, R., Lown, B.: "Psychological stress and ventricular arrhythmias during myocardial infarction in the conscious dog." *Am. J. Cardiol.* **34**: 692-696 (1974). H94,394/74

Lenzner, A. S.: "Psychiatry in the coronary care unit." *Psychosomatics* **15**: 70-71 (1974). H87,383/74

It has been so definitely established that stress plays a crucial role in CHD that the Academy of Psychosomatic Medicine formulated the following resolution at its twentieth annual meeting in 1973: "psychosocial stresses must be included among the recognized high risk factors in myocardial infarction . . . [and] . . . the psychiatrist and psychosocial team [must] be formally incorporated as an integral part of the Coronary Care Unit for every patient."

Turner, R., Ball, K.: "Prevention of coronary heart-disease." *Lancet* March 9, 1974, pp. 411-412. H83,448/74

Empirical findings on the prevention of CHD by protection against excessive psychogenic stress.

Friedman, M., Rosenman, R. H.: *Type A*

Behavior and Your Heart, p. 276. New York: Alfred A Knopf, 1974. E10,671/74

Detailed discussion of the authors' definition of Type A and Type B behavior as influencing predisposition to CHD. Emphasis is placed upon the fact that Type A, the coronary-prone patient, is exposed to much more stress than Type B (no refs.).

Rahe, R. H., Romo, M.: "Recent life changes and the onset of myocardial infarction and coronary death in Helsinki." In: Gunderson, E. K. E. and Rahe, R. H., *Life Stress and Illness*, pp. 105-120. Springfield, Ill.: Charles C Thomas, 1974 (18 refs.).

Conditioning

Genetics. Genetic predisposition undoubtedly plays an extremely important role in CHD. Evidence supporting this concept was presented in the previous section in which the constitutional types of predisposed and comparatively resistant individuals were delineated from the psychologic point of view. Of course, various other risk factors, such as a tendency to excessive eating, smoking, high cholesterol and FFA levels, accelerated blood coagulation, disinclination to exercise and so on are also largely dependent upon inherited constitutional factors. In any event, CHD appears to run in families, as do hypertension, the smoking habit, high cholesterol, triglyceride and β -lipoprotein levels and Type A behavior.

Diet. The dietary factors that predispose to cardiovascular disease in general exert the same conditioning effect upon stress-induced hypertension or CHD. The most recognized among these nutritional factors are the foods with high saturated fat content (mainly animal fat) and cholesterol. However, especially in the presence of renal disease and hypertension, excessive sodium intake is also harmful, as is gluttony in general, because the resulting adiposity makes increased demands upon the circulatory system and at the same time augments the stressor effect of exercise.

Occupation, Social Factors including Urbanization. According to large statistical surveys, the incidence of CHD has greatly increased during the present century, and the relative immunity of primitive races disappears when they subject themselves to

civilized life. However, the effect upon statistics of constantly improving diagnostic techniques and more accurate reporting of death from CHD must not be neglected.

It has been claimed that in a series of one hundred young coronary patients, emotional strain of occupational origin was noted in 91 percent, as compared with 20 percent in normal controls.

In another study, myocardial infarction among male employees proved to be inversely proportional to their annual income; however, such findings are difficult to interpret. The demands of top management jobs may be no more stressful than those of low level jobs, but usually, men chosen for advancement are those whose personalities endow them with both executive talent and resistance to CHD in that they are better adjusted to life. In any event, other statistical studies gave opposite results, which were attributed to the greater drive and willingness to accept stressful responsibilities among those who reach higher echelons.

It has also been claimed that geographically and occupationally mobile subjects have a higher CHD incidence than others. This may be ascribed to their need for more frequent readjustment and adaptation to new circumstances.

It is generally agreed that urban life is more conducive to hypertension and CHD than rural settings, but here again it is difficult to distinguish between the relative role played by crowding, differences in diet, occupations, air pollution and so on. In any event, the occupational stressors of industrial society appear to play a dominant role in the high incidence of CHD as well as in establishing a predisposition for it through a rise in plasma lipids, altered hemodynamics, and accelerated blood clotting.

An extensive epidemiologic study on thirty-one thousand men in London showed CHD to be more frequent among those holding sedentary jobs. Bus conductors were found to have less CHD than bus drivers, postmen less than telephonists, executives and clerks. It is implied that these differences are determined by the amount of exercise required by their jobs. Extensive statistical studies among twelve thousand members of fourteen professional groups in the U.S.A. showed that CHD was strikingly related to occupational activity among physicians, lawyers, security analysts and traders.

Yet another statistical study in high and low stress areas of Detroit revealed that social and economic stressors definitely predisposed to increased blood pressure, especially among blacks.

In Israeli kibbutzim, agricultural workers were most likely to experience stress associated with CHD, although the generally-accepted predisposing factors among them did not significantly differ from those in managerial, professional, clerical or factory workers.

Age. It is hardly worth reiterating the well-known fact that the incidence of arteriosclerosis and CHD increases with age. However, among 866 patients eighteen to thirty-nine years old, a fatal coronary attack often occurred during strenuous activity related to combat and other military duties.

There is a general impression, not supported by convincing statistical evidence, that fatal CHD occurs more frequently among young people now than some decades ago.

Allegedly, in juvenile hypertension, excess production of mineralocorticoids—which activate hepatic hypertensinogen formation and catecholamine secretion—is especially important. However, these findings have not yet been confirmed.

<Conditioning

(See also our earlier stress monographs, p. xiii, and cf. individual conditioning factors)

Genetics. Gertler, M. M., White, P. D.: *Coronary Heart Disease in Young Adults. A Multidisciplinary Study*, p. 218. Cambridge, Mass.: Harvard University Press, 1954.

E10,486/54

An excellent multidisciplinary study conducted at the Massachusetts General Hospital with the cooperation of several experienced cardiologists, reviewing the indices characteristic of the "coronary candidate" and the precipitating agents of CHD, including heredity, athletic activity, endocrine factors, diet and blood biochemistry (several hundred refs.).

Kruse, H.: "Committee on cultural, societal, familial, psychological, and genetic influences." *Am. J. Public Health* 50 Supp.: 71-104 (1960). E48,857/60

Extensive review by a committee on cultural, societal, familial, psychologic and genetic influences upon the development of cardiovascular disease, with special reference to stress and the G.A.S.

Mordkoff, A. M., Parsons, O. A.: "The coronary personality: a critique." *Psychosom. Med.* 29: 1-14 (1967) (54 refs.).

J23,148/67

Rosenman, R. H., Friedman, M., Straus, R., Jenkins, C. D., Zyzanski, S. J., Wurm, M.: "Coronary heart disease in the Western Collaborative Group study. A follow-up experience of 4½ years." *J. Chron. Dis.* 23: 173-190 (1970). J9,014/70

In a follow-up study of 3,182 men thirty-nine to fifty-nine years old, "a significantly increased incidence of CHD was found to be associated with parental history of CHD, elevated systolic or diastolic blood pressure, cigarette smoking, higher serum levels of cholesterol, triglyceride and beta lipoproteins, and the Type A behavior pattern."

Diet. Lipman, D. G.: "Stress and hypertension: use of antistress diet and antihistamine." *J. Am. Geriatr. Soc.* 8: 177-184 (1960). C81,912/60

Detailed description of a diet which allegedly alleviates stress-induced hypertension, especially when given in combination with an antihistaminic.

Bajusz, E.: *Nutritional Aspects of Cardiovascular Diseases*, p. 244. London: Crosby Lockwood & Son, 1965. E5,013/65

Monograph on the influence of diet upon the development of cardiovascular disease, with special emphasis on nutritional factors determining predisposition to stress-induced experimental cardiac necroses.

Russek, H. I.: "Role of emotional stress in the etiology of clinical coronary heart disease." *Dis. Chest.* 52: 1-9 (1967).

F85,321/67

A careful survey of the literature and personal observations lead to the conclusion that "the concept of any disease arising from a single cause is obsolete and misleading. Much evidence now suggests that most of the lethality of a high fat diet in Western society may actually be dependent on the 'catalytic' influence of stressful living." This is particularly true of CHD (36 refs.).

Raab, W.: *Preventive Myocardiology. Fundamentals and Targets*, p. 227. Springfield, Ill.: Charles C Thomas, 1970.

E8,717/70

Monograph reviewing the many measures (diet, life habits, exercise, and so on) that have been recommended for the prevention of cardiovascular disease in man. Attention is given to interactions between corticoids, catecholamines and diets, especially on the basis of corresponding animal experiments (almost 1,000 refs.).

Occupation, Social Factors including Urbanization. Stewart, I. McD. G.: "Coronary disease and modern stress." *Lancet* December 23, 1950, pp. 867-870.

B54,219/50

Review of the literature suggests that the incidence of CHD has greatly increased during the present century. The immunity enjoyed by primitive races disappears when they subject themselves to civilized life with its associated mental stresses and richness of diet. "It is, in fact, reasonable to identify sufferers from coronary disease as the selected victims of modern stress."

Morris, J. N., Heady, J. A., Raffle, P. A. B., Roberts, C. G., Parks, J. W.: "Coronary heart-disease and physical activity of work." *Lancet* November 21 and 28, 1953, pp. 1053; 1111; 1120. D85,741/53

An extensive epidemiologic study on thirty-one thousand men aged thirty-five to sixty-four years was performed in London,

showing that physically active men apparently have a lower incidence of CHD in middle age than those holding sedentary jobs. "Transport workers, postal workers, and Civil Service executive officers and clerks were observed during 1949-50. Bus conductors (on double-decker vehicles) were found to have less coronary heart-disease than bus drivers, and postmen less than telephonists, executive officers, and clerks."

Sigler, L. H.: "Cardiac disability and death caused by strains: problem in workmen's compensation." *J.A.M.A.* 154: 294-299 (1954). B89,752/54

Russek, H. I., Zohman, B. L.: "Relative significance of heredity, diet and occupational stress in coronary heart disease of young adults. Based on an analysis of 100 patients between the ages of 25 and 40 years and a similar group of 100 normal control subjects." *Am. J. Med. Sci.* 235: 266-277 (1958). A352/58

Hereditary predisposition and high-fat diets are undoubtedly important conditioning factors in CHD. However, in one hundred young coronary patients, "severe emotional strain of occupational origin was observed in 91% of the test subjects as compared with 20% of normal controls. Emotional stress associated with job responsibility appears far more significant in the etiologic picture of coronary disease in young adults than heredity or a prodigiously high-fat diet." Smoking "would appear to be an indication of heightened emotional tension rather than a predisposing or causative factor in coronary heart disease."

Lee, R. E., Schneider, R. F.: "Hypertension and arteriosclerosis in executive and non-executive personnel." *J.A.M.A.* 167: 1447-1450 (1958). C81,673/58

The authors were surprised to learn that, among more than one thousand subjects in business, hypertension and cardiovascular disease (arteriosclerosis, CHD, myocardial infarction) were disproportionately low in the executive group. They noted that "stress is a relative matter and that the disruption of the harmonious balance between a man and his environment can result from either the demands of the environment or the failure of the man to measure up to them. Success in a career goes hand in hand with good health. The executive, as part of his training, learns to judge the amount of occupational stress he

can stand and to appreciate the value of outside avenues of expression."

Rosenman, R. H., Friedman, M.: "The possible relationship of occupational stress to clinical coronary heart disease." *Calif. Med.* 89: 169-174 (1958). C61,455/58

Review of the literature and personal observations showing that the predisposing factors for CHD (increased plasma lipids, intimal damage, altered hemodynamics, accelerated blood clotting) are affected by various types of stressors. "It is suggested that the increasing occupational stress unique to industrialized society plays a dominant role in the high incidence of clinical coronary heart disease."

Russek, H. I.: "Role of heredity, diet, and emotional stress in coronary heart disease." *J.A.M.A.* 171: 503-508 (1959).

C74,784/59

In ninety-one of one hundred patients, prolonged emotional strain related to occupational responsibilities preceded a coronary attack. Smoking is particularly frequent among coronary patients, but it may be a manifestation of inner stress rather than an etiologic factor. Furthermore, much of our envied leisure time is regimented by participation in social, educational and civic events which "may represent a poor antidote for the emotional stresses of daily business competition."

Mortensen, J. M., Stevenson, T. T., Whitney, L. H.: "Mortality due to coronary disease analyzed by broad occupational groups." *Arch. Ind. Hyg.* 19: 1-4 (1959).

E57,220/59

A statistical study shows that "in the Bell Telephone System there is no material difference in coronary mortality between the top management group and the craftsmen and laborers group, but there is a marked difference between top management and middle management which is not explainable from presently available data. The popular notion that high executive positions are associated with high coronary mortality is likely due to the greater publicity connected with such deaths rather than to statistical facts."

Master, A. M.: "The role of effort and occupation (including physicians) in coronary occlusion." *J.A.M.A.* 174: 942-948 (1960).

J7,796/60

A general review of epidemiologic data

does not convince the author that the frequency of CHD has reached epidemic proportions or is elicited by the stress of modern life. He believes that its apparently greater incidence is due to increased population age and improved diagnostic techniques.

Russek, H. I.: "Emotional stress and coronary heart disease in American physicians, dentists and lawyers." *Am. J. Med. Sci.* **243**: 716-725 (1962). D34,808/62

Questionnaires sent to ten thousand physicians, dentists and attorneys aged forty to sixty-nine showed a definite positive correlation between occupational stress and CHD. "General practitioners in each field showed coronary heart disease prevalence rates 2 to 3 times those of the specialists selected for survey. No consistent relationship was found for prevalence rates of reported hypertension and occupational stress." Correlations of the data with the diets of these subjects "lend support to clinical and experimental studies which suggest that emotional stress is an important accelerating factor in atherogenesis when the diet is relatively high in animal fat" (28 refs.).

Pell, S., D'Alonzo, C. A.: "Acute myocardial infarction in a large industrial population. Report of a 6-year study of 1,356 cases." *J.A.M.A.* **185**: 831-838 (1963).

E26,954/63

The age-adjusted incidence of myocardial infarction among male employees was inversely proportional to their annual income. These results are difficult to interpret because "the demands of a top-management job may be no more stressful than situations commonly encountered by persons in lower job levels, at work and at home. Secondly, men chosen for advancement may be those whose personal qualities are characteristic of both executive talent and resistance to coronary disease. It is conceivable, for example, that in selecting persons to assume greater responsibilities, supervisors and managers, knowingly or unknowingly, may tend to choose the better adjusted individuals, who by virtue of their personality and psychic state are better able to cope with life's stresses in general."

Syme, S. L., Hyman, M. M., Enterline, P. E.: "Some social and cultural factors associated with the occurrence of coronary heart disease." *J. Chron. Dis.* **17**: 277-289 (1964).

J11,128/64

Systematic studies on the incidence of

CHD in North Dakota (performed irrespective of diet, body weight, blood pressure, smoking or parental longevity) showed that "geographically mobile subjects had a ratio twice that of geographically stable subjects; occupationally mobile men had a ratio three times higher than that of occupationally stable men."

Wardwell, W. I., Hyman, M., Bahnsen, C. B.: "Stress and coronary heart disease in three field studies." *J. Chron. Dis.* **17**: 73-84 (1964).

G1,335/64

Brief statistical study indicating a high probable correlation between CHD and social, cultural and even religious factors. Although further proof is necessary, the study suggests that in the U.S.A., "coronary heart disease may be viewed as an alternative to certain personality disorders, particularly for native-born American middle class Protestants, who are culturally not permitted to be weak or to fail to compete successfully" (35 refs.).

Russek, H. I.: "Stress, tobacco, and coronary disease in North American professional groups. Survey of 12,000 men in 14 occupational groups." *J.A.M.A.* **192**: 189-194 (1965).

F36,826/65

Statistical studies on twelve thousand professional men in fourteen occupational categories in the United States. On the basis of questionnaires evaluated by specialists in each field, CHD was "strikingly related to the relative stressfulness of occupational activity" among physicians, lawyers, security analysts and traders. High fat diets and smoking were associated with a high incidence of CHD in combination with emotional stress. Smoking was most frequent in stressful occupations, but unexpectedly CHD was more common among nonsmokers than among persons who once smoked but gave it up. Possibly, "the ability to stop smoking may imply a resilient personality response to stress and diminished vulnerability to atherogenic influences."

Smith, T.: "A review of empirical findings." *Milbank Mem. Fed. Q.* **45** No. 2, Part 2: 23-39 (1967).

J10,923/67

Brief review suggesting that modern urban industrialized society is associated with a greater incidence of hypertension and CHD than rural settings. Migrants have an unusually high incidence of these diseases both at their place of origin and at their destination (26 refs.).

Marks, R. U.: "A review of empirical findings." *Milbank Mem. Fed. Q.* **45** No. 2, Part 2: 51-107 (1967). J10,924/67

Extensive review of the demographic variables, particularly urbanization, in relation to CHD (154 refs.).

Jenkins, C. D.: "Appraisal and implications for theoretical development." *Milbank Mem. Fed. Q.* **45** No. 2, Part 2: 141-150 (1967). J10,925/67

Brief review on the role of socioenvironmental stressors in the pathogenesis of CHD.

Scheinman, H. Z.: "Coronary atherosclerosis in military pilots: I. Relationship to flying and aviation accidents." *Aerosp. Med.* **39**: 1348-1351 (1968). G85,445/68

Autopsies on 206 military pilots "demonstrate that the amount of flying time (when the age factor is considered) and type of aircraft are neither statistically related nor contributory to the severity of coronary atherosclerosis." It is concluded that drastic elimination of older aircrew will not significantly reduce aviation accidents.

French, J. R. P., Caplan, R. D.: "Psychosocial factors in coronary heart disease." *Proc. Ann. Conf. NASA Clin. Dir., Environm. Health Off. Med. Program Advisors*, pp. 26-72 (1969). J16,126/69

Matsumoto, Y. S.: "Social stress and coronary heart disease in Japan." *Milbank Mem. Fed. Q.* **48**: 9-36 (1970).

G73,150/70

In Japan the incidence of arteriosclerotic CHD is extremely low as compared to its incidence among the white North American population. "Although the diet factor remains dominant in current thinking, the stress hypothesis merits the most intensive probing as alternate or associated explanations of observed relations and differentiations" (87 refs.).

Gutmann, M. C., Benson, H.: "Interaction of environmental factors and systemic arterial blood pressure: a review." *Medicine* (Baltimore) **50**: 543-553 (1971).

G33,290/71

Excellent epidemiologic and experimental study showing that hypertension is related to environmental conditions requiring continuous behavioral and physical readjustments, especially with regard to urbanization. "Operant conditioning techniques may be useful in training humans to lower their blood pressure in environmental situations previously

associated with pressor responses" (85 refs.).

Sales, S. M., House, J.: "Job dissatisfaction as a possible risk factor in coronary heart disease." *J. Chron. Dis.* **23**: 861-873 (1971). J10,970/71

Statistical studies show that "job satisfaction is negatively related to a group's rate of death from coronary heart disease."

Jenkins, C. D.: "Psychologic and social precursors of coronary disease. Parts 1 & 2." *N. Eng. J. Med.* **284**: 244-255; 307-317 (1971) (96 & 162 refs.). H35,196/71

Harburg, E., Erfurt, J. C., Chape, C., Hauenstein, L. S., Schull, W. J., Schork, M. A.: "Socioecological stressor areas and black-white blood pressure: Detroit." *J. Chron. Dis.* **26**: 595-611 (1973). J8,243/73

Comparative studies in high- and low-stressed areas of Detroit revealed that social and economic stress definitely predisposes to increased blood pressure, especially in blacks.

Reeder, L. G., Schrama, P. G. M., Dirken, J. M.: "Stress and cardiovascular health: an international cooperative study. I." *Soc. Sci. Med.* **7**: 573-584 (1973). J15,755/73

The data obtained from questionnaires used in the Los Angeles Heart Study's SSS correlate well with a similar psychosomatic stress scale developed in the Netherlands. An extensive study on postal and telegraph workers indicated that "a relatively low job level was related to a relatively high number of EKG abnormalities. These latter findings may be predictive of future coronary artery disease in this group" (53 refs.).

Shirom, A., Eden, D., Silberwasser, S., Kellermann, J. J.: "Job stresses and risk factors in coronary heart disease among five occupational categories in kibbutzim." *Soc. Sci. Med.* **7**: 875-892 (1973). J8,517/73

Among 762 adult male kibbutz members in Israel, agricultural workers were most likely to experience stress associated with CHD. Yet such cardiac lesions and acknowledged risk factors predisposing for them "did not significantly differ among managerial and professional workers, clerical workers, craftsmen, factory workers and agricultural workers."

House, J. S.: "Occupational stress and coronary heart disease: a review and theoretical integration." In: O'Toole, J., *Work and the Quality of Life. Resource Papers for Work in America*. (In Press). J16,202/75

Age. Yater, W. M., Traum, A. H., Brown, W. G., FitzGerald, R. P., Geisler, M. A., Wilcox, B. B.: "Coronary artery disease in men eighteen to thirty-nine years of age. Report of eight hundred sixty-six cases, four hundred fifty with necropsy examinations." *Am. Heart J.* **36**: 334-372; 481-526; 683-722 (1948). C45,577/48

Extensive clinical and anatomical studies on coronary arteriosclerosis and cardiac infarcts in 866 patients eighteen to thirty-nine years of age, in whom the fatal coronary attack occurred most frequently during strenuous activity related to combat and other military duties (162 refs.).

Kappert, A.: "Der jugendliche Hochdruck" (Juvenile hypertension). *Schweiz. Med. Wochenschr.* **82**: 821-825 (1952).

J7,692/52

Review on juvenile hypertension with reference to the possible role of stress. This view is supported not only by the production of mineralocorticoid hypertension with DOC in rats, but also by the fact that both glucocorticoids and mineralocorticoids can activate hepatic formation of hypertensinogen, and that

stress is well known to cause catecholamine secretion and a rise in blood pressure.

Hauss, W. H.: "Tissue alterations due to experimental arteriosclerosis." In: Vogel, H. G., *Connective Tissue and Ageing* (Int. Congr. Ser. No. 264), pp. 23-33. Amsterdam: Excerpta Medica, 1973. J14,882/73

In rats the emotional stress produced by restraint elicits typical mesenchymal reactions in the blood vessel walls with increased ³⁵S-sulfate and ³H-thymidine incorporation. Essentially similar changes occur after exposure to other stressors, and these are considered to be the first step in the arteriosclerotic process characteristic of aging. "The deformation of the structure of the arterial wall participates essentially in the development of lipidosis, fibrinosis, and cell necroses. Aggregation of thrombocytes and thrombosis in the arterial wall results from the frequent reduplication of intima cells."

Hrubec, Z., Zukel, W. J.: "Epidemiology of coronary heart disease among young army males of World War II." *Am. Heart J.* **87**: 722-730 (1974). H86,845/74

Diagnostic Indicators and Other Changes Characteristic of Stress-Induced Cardiovascular Disease

In practice it is virtually impossible to separate diagnostic indicators from other changes characteristic of stress-induced cardiovascular disease that are not particularly helpful in diagnosis. Since all these also help to analyze the pathogenesis of such maladies, they will be discussed here conjointly.

Stress Tests. Tests commonly employed to evaluate the stress resistance of patients with cardiovascular disease have already been discussed in the section on Stress Tests in general. They are based mainly on resistance to muscular exercise (bicycle ergometer, treadmill, step tests) although "stress interviews" and cold pressor tests also have some diagnostic value. Furthermore, in early hypertensive patients, psychogenic stress (for example, arithmetic under time pressure) causes an unusual rise in pulse rate, blood pressure, blood glucose, oxygen consumption, muscular tone, plasma NEP, FFA, cortisol and renin activity.

Morphology. Histologic evidence suggests that the development of coronary thrombosis is often very gradual taking several days before pain and occlusion become manifest.

In patients who died from CHD following severe stress, there was extensive fuchsinophilic degeneration of the myocardium (similar to that seen in experimental animals during the ESCN), indicating a necrosis "of metabolic origin."

A review of the literature also suggested that various nonvascular noxious factors

interfering with myocardial metabolism play a decisive role in CHD. This is true especially of the production of microfocal necroses which coincide with or aggravate the pathogenic effects of primarily vascular disturbances.

"Stress polycythemia" is manifested by a normal erythrocyte mass, but a high hematocrit reading secondary to contracted plasma volume. This condition can be elicited by a variety of stressors and may be related to certain types of hypertension.

Blood Clotting. The frequent lack of correlation between coronary thrombosis and myocardial infarction or "sudden coronary heart death," which was repeatedly emphasized in the earlier literature, has again been demonstrated on the basis of an extensive review. "In more than 50% of the examined acute-recent infarct and sudden coronary heart death cases, an acute-recent occlusion was not detected." In other patients, it took place in an already almost completely stenotic vessel so that it could have little effect; hence, special attention must be given to the "infarctoid myocardial necroses" such as have been produced in animals by combined treatment with steroids and stressors.

Cardiac catheterization and other stressful procedures caused a rise in the platelet aggregation response to ADP, concurrently with an increase in plasma FFA. It is suggested that catecholamines, released during emotional stress, may be responsible for enhanced platelet aggregation and the development of thrombosis as well as atherosclerosis.

Hormones. There can hardly remain any doubt today about the participation of hormones in the development of stress-induced cardiovascular disease. Evidence in favor of this view has come from observations in man and from animal experiments. Here, we shall limit ourselves to clinical findings, since a special section is devoted to experimental cardiovascular diseases.

Catecholamines liberated from sympathetic nerve endings and the adrenal medulla cause a dramatic rise in blood pressure. Hence, their role in hypertension has long been suspected, and the production of what we have called "mineralocorticoid hypertension" in DOC-treated animals has led to many clinical studies on this and related steroids in patients with various forms of hypertension.

The relevant literature has become too voluminous to be discussed here in detail; besides, a large part of it has already been analyzed in "our earlier stress monographs" (p. xiii).

Suffice it to say here, that an increase in the plasma and urinary concentration of catecholamines, of several mineralocorticoids (DOC, 18-OH-DOC, aldosterone) and renin has repeatedly, though not consistently, been noted in hypertensive patients. There is good reason to believe that both hypertension and CHD can be elicited during stress through a rise in the secretion of any of these humoral substances, and are often caused by the concurrent overproduction of several among them; one or the other can play the predominant role, depending upon conditioning factors.

For a detailed discussion of hormonal participation in the pathogenesis of hypertension and other cardiovascular diseases the reader must be referred to pertinent reviews and monographs, but it may be useful to summarize at least a few of the more salient facts.

There is good evidence that catecholamines and corticoids mutually enhance each other's pressor effects and that the hypertensive actions of mineralocorticoids are augmented by a high sodium intake. The latter also predisposes the kidney to damage,

especially by mineralocorticoids, including renin-stimulated mineralocorticoid secretion. Thus, a vicious circle may develop in which mineralocorticoids elicit renal injury and the resulting rise in renal pressor substances augments mineralocorticoid secretion, which further damages the kidney until fatal malignant hypertension ensues.

In predisposed persons, virtually any kind of stressor causes a rise in blood pressure as well as in catecholamine and corticoid secretion; furthermore, the therapeutic efficiency of both adrenergic blocking agents (for example, propranolol) and antimineralcorticoids (for example, spironolactone) supports this hypothesis. It is still difficult, however, to explain the occasional instances of hypertension in which the blood level of renin is subnormal. According to some investigations, this "hyporeninemic hypertension" is probably a pluricausal disease of variable etiology, often dependent upon increased production of some mineralocorticoid which decreases renin secretion.

A prolonged increase in blood pressure undoubtedly damages the vessel walls and contributes to the development not only of arteriosclerosis but even of the hyalinizing arterial lesions characteristic of malignant hypertension and periarteritis nodosa. All of this presumably can enhance the narrowing of cardiac arteries, and by damaging their endothelium, eventually results in thrombosis. The latter is further facilitated by the well-known decrease in blood clotting time produced by catecholamines.

Nevertheless, an ever-increasing body of evidence suggests that many types of myocardial necrosis are not due to coronary thrombosis but to metabolic necroses of the myocardium in which corticoids and sodium play decisive roles, as we shall see in the section Experimental Cardiovascular Diseases. Furthermore, not all cases of sudden death produced by acute stress are due to myocardial necrosis; they may be of purely functional origin, for example, ventricular fibrillation.

Nonhormonal Metabolites. The nonhormonal metabolic changes associated with stress-induced cardiovascular disease are often those characteristic of stress itself, such as a rise in serum FFA and cholesterol; these are highly subject to the conditioning influence of the diet. Allegedly, hypertensive patients also tend to have especially high adrenal cholesterol levels.

Diagnostic Indicators and Other Changes Characteristic of Stress-Induced Cardiovascular Disease

(See also our earlier stress monographs, p. xiii)

Stress Tests. Wolf, S., Cardon, P. V. Jr., Shepard, E. M., Wolff, H. G.: *Life Stress and Essential Hypertension. A Study of Circulatory Adjustments in Man*, p. 253. Baltimore: Williams & Wilkins, 1955. E145/55

Monograph on the role of stress in the production of essential hypertension in man. Principal emphasis is placed upon stress interviews and a cold pressor test as diagnostic indices. Adrenocortical participation is only briefly considered (158 refs.).

Payne, R. M., Horwitz, L. D., Mullins, C. B.: "Comparison of isometric exercise and

angiotensin infusion as stress test for evaluation of left ventricular function." *Am. J. Cardiol.* 31: 428-433 (1973). H68,564/73

Baumann, R., Ziprian, H., Gödicke, W., Hartrodt, W., Naumann, E., Läuter, J.: "The influence of acute psychic stress situations on biochemical and vegetative parameters of essential hypertensives at the early stage of the disease." *Psychother. Psychosom.* 22: 131-140 (1973). J10,171/73

In early hypertensive patients, psychogenic stress (arithmetic under time pressure) caused: a rise of the pulse rate, an increased systolic and diastolic blood pressure; a prolonged persistence of increased pulse rate and blood glucose; elevated "oxygen consumption and muscular tonus (both the initial values and the values after stress situations were higher in hypertensives than in

the control group); a rise of noradrenalin, free fatty acids, cortisol and renin activity (orthostasis effect) in the plasma. In contrast to the control group, the adaptation of hypertensives to repeated experimental stress situations was markedly disturbed."

Theorell, T., Rahe, R. H.: "Psychosocial characteristics of subjects with myocardial infarction in Stockholm." In: Gunderson, E. K. E. and Rahe, R. H., *Life Stress and Illness*, pp. 90-104. Springfield, Ill.: Charles C Thomas, 1974. E10,684/74

CHD is discussed as a stress disease, mainly on the basis of the SRE questionnaire (44 refs.).

Ander, S., Lindstrom, B., Tibblin, G.: "Life changes in random samples of middle-aged men." In: Gunderson, E. K. E. and Rahe, R. H., *Life Stress and Illness*, pp. 121-124. Springfield, Ill.: Charles C Thomas, 1974. E10,686/74

The SRE questionnaire correlates fairly well with CHD in this retrospective study.

Imschoot, K. van, Liesse, M., Mertens, C., Lauwers, P.: "Caractéristiques psychologiques et réactions physiologiques au stress de sujets normaux et coronariens. II" (Psychologic characteristics of normal subjects and coronary patients, and their physiologic reaction to stress. II). *J. Psychosom. Res.* **18**: 75-87 (1974). J14,110/74

According to several physiologic tests, coronary patients respond to stressors less markedly than others, perhaps because they live under permanent stress, are accustomed to stress, or because their responses are impaired (38 refs.).

Gould, K. L., Hamilton, G. W., Lipscomb, K., Ritchie, J. L., Kennedy, J. W.: "Method for assessing stress-induced regional malperfusion during coronary arteriography. Experimental validation and clinical application." *Am. J. Cardiol.* **34**: 557-564 (1974). H92,788/74

Helfant, R. H., DeVilla, M. A., Meister, S. G., Banka, V. S.: "Isometric handgrip stress in evaluation of left ventricular performance in patients with coronary heart disease" (abstracted). *Clin. Res.* **22**: 279A (1974). H90,122/74

Morphology. Danilova, K. M.: "Morphological tests of the stress reaction in human myocardium." *Arkh. Pathol.* **25** No. 7: 42-49 (1963) (Russian). G29,912/63

In patients who died following severe stress, fuchsinophilic degeneration of the myocardium was usually severe and accompanied by diffuse necrosis "of metabolic origin."

Myasnikov, A. L.: "Myocardial necroses of coronary and noncoronary genesis." *Am. J. Cardiol.* **13**: 435-440 (1964).

F7,701/64

A review of the literature and personal observations led the author to conclude: "it has become quite clear that various nonvascular noxious influences directly interfering in myocardial metabolism (such as anoxemic, hormonal and neurogenic) are of outstanding importance in the origin of myocardial necroses, either as primary or as contributory factors. This applies in particular to the multiple, microfocal type of necroses, frequently developing by coincidence with, or aggravation of, the pathogenic effects of primarily vascular disturbances." The role of stress hormones and electrolytes is particularly emphasized.

Sośnierz, M., Wieczorek, M.: "The influence of stress on the pathomorphologic state of the heart." *Patol. Pol.* **17**: 361-368 (1966) (Polish). F86,559/66

In a series of ninety-two patients who died of various diseases, fuchsinophilic degeneration of the myocardium was constant among old people and absent in neonates. The intensity of fuchsinophilia was particularly high in patients who died under very stressful circumstances.

Emery, A. C. Jr., Whitcomb, W. H., Frohlich, E. D.: "'Stress' polycythemia and hypertension." *J.A.M.A.* **229**: 159-162 (1974).

H87,420/74

"'Stress' polycythemia is a term that refers to a disorder manifested by a normal red blood cell mass, but a high hematocrit reading secondary to a contracted plasma volume. The latter has been ascribed to a wide variety of stressful factors including emotional stress, chronic anxiety, alcoholism, and a variation of the normal state. Hypertension (perhaps too long associated with 'stress') has been closely associated with 'stress' polycythemia" (30 refs.).

Postnov, V. V., Strakhov, E. V., Glukhovets, B. I., Gorkova, S. I.: "Hypothalamic neurosecretory nuclei and nucleus habenularis of epithalamus in essential hypertension." *Virchows Arch. [Pathol. Anat.]* **364**: 275-283 (1974). H95,408/74

"In patients with essential hypertension, morphological signs of functional hypertrophy were observed in the nucleus habenularis of the epithalamus."

Blood Clotting. Paterson, J. C.: "Relation of physical exertion and emotion to precipitation of coronary thrombi." *J.A.M.A.* **112**: 895-897 (1939). B29,339/39

Histologic evidence suggests that the development of coronary thrombosis is a gradual process, sometimes taking several days before pain and occlusion are manifest. Therefore, events immediately preceding the attack are not of etiologic significance. "The pathologic appearances in a series of fatal cases of coronary thrombosis suggest strongly that excessive exercise and emotional stress are intimately concerned in the mechanism of coronary artery thrombosis."

Stoica, E., Costa-Foru, D., Cherculescu, F.: "The reactivity of the clotting mechanism and fibrinolysis in cerebral thrombotic disease." *J. Neurol. Sci.* **4**: 491-500 (1967). J22,642/67

"Emotional stress induced a sustained hypercoagulability only in patients with occlusive cerebral softening (verified by angiography) and in those with peripheral atherosclerosis obliterans; concomitantly, in these patients an unresponsiveness of the fibrinolytic system to stress was observed."

Baroldi, G.: "Lack of correlation between coronary thrombosis and myocardial infarction or sudden 'coronary' heart death." *Ann. N.Y. Acad. Sci.* **156**: 504-525 (1969). G79,107/69

Extensive review of the literature on sudden death due to coronary infarction showing that "in more than 50% of the examined acute-recent infarct and sudden coronary heart death cases, an acute-recent occlusion was not detected. In most of the remaining cases, the acute-recent thrombosis had little if any effect, either because it took place in highly stenotic vessels (more than 65%) with enlarged anastomotic circulation, or because the acute-recent thrombosis was not coeval with the myocardial damage." Hence, special attention is called to the "infarctoid myocardial necroses," such as have been produced in animals by combined treatment with various diets, hormones, and subsequent exposure to stressors.

Gordon, J. L., Bowyer, D. E., Evans, D. W., Hutchinson, M. J.: "Human platelet

reactivity during stressful diagnostic procedures." *J. Clin. Pathol.* **26**: 958-962 (1973). H83,536/73

In conscious patients, cardiac catheterization and other stressful procedures caused a rise in the platelet aggregation response to ADP, with a concurrent increase in plasma FFA. "It is suggested that catecholamines released due to emotional stress may be responsible for the increased platelet responses to ADP and that this could influence the development of thrombosis and atherosclerosis."

Haft, J. I., Fani, K.: "Intravascular platelet aggregation in the heart induced by stress." *Circulation* **47**: 353-358 (1973). G99,534/73

In rats, immersion in cold water causes platelet aggregation in myocardial vessels, as shown by EM. "It is concluded that stress, probably via catecholamine secretion that enhances platelet stickiness, can induce intravascular platelet aggregation. It is possible that this mechanism plays a part in the relationship between stress and acute clinical myocardial infarction."

Levites, R., Haft, J. I.: "Effects of exercise-induced stress on platelet aggregation" (abstracted). *Clin. Res.* **22**: 285A (1974). H90,126/74

Hormones. Demura, R. K.: "Pituitary-adrenocortical function in essential hypertension." *J. Jap. Soc. Intern. Med.* **51**: 93 (1962). J11,873/62

The plasma 17-OHCS level is increased in patients with essential hypertension.

Raab, W.: "Neurogenic multifocal destruction of myocardial tissue. (Pathogenic mechanism and its prevention)." *Rev. Can. Biol.* **22**: 217-239 (1963). E21,307/63

Enhanced catecholamine and corticoid secretion can produce myocardial necrosis, presumably by increasing the sodium and decreasing the potassium content of the myocardium. "The first immediate specific effect upon the heart muscle which all stresses have in common is due to the reflex-mediated influx of catecholamines into the myocardial tissue."

Raab, W.: "The nonvascular metabolic myocardial vulnerability factor in 'coronary heart disease.' Fundamentals of pathogenesis, treatment, and prevention." *Am. Heart J.* **66**: 685-706 (1963). E31,416/63

Review on the role of stress, catechol-

amines and corticoids in the genesis of myocardial infarction.

Raab, W.: "Emotional and sensory stress factors in myocardial pathology." *Am. Heart J.* **72**: 538-564 (1966). F70,981/66

Perusal of the "world literature provides abundant experimental and clinical evidence for a potentially cardiotoxic overproduction of sympathogenic catecholamines and adrenocortical steroids, resulting from emotional and sensory stress-induced stimulations of the central nervous system and the pituitary gland. Fear, anger, and frustration, as well as, to a lesser extent, optical, acoustical, and thermal annoyances act as the most common potentially pathogenic stimuli." In addition, stress-induced sympathetic and adrenocortical stimulation also affect the myocardium indirectly through blood pressure elevation and other hemodynamic effects (305 refs.).

Raab, W.: "Correlated cardiovascular adrenergic and adrenocortical responses to sensory and mental annoyances in man. A potential accessory cardiac risk factor." *Psychosom. Med.* **30**: 809-818 (1968).

G64,304/68

"Standardized mild sensory and mental annoyances, comparable to those frequently occurring in civilized everyday life (noise, flickering light, mental arithmetic), were found to provoke significant elevations of the plasma cortisol level, paralleled by manifestations of cardiac sympathetic stimulation, particularly in emotionally excitable individuals. The pattern of cardiovascular adrenergic responses proved rather constant when repeated within 4-5 years." These neurogenic and hormonal stress responses may play an important role in CHD.

Nestel, P. J.: "Blood-pressure and catecholamine excretion after mental stress in labile hypertension." *Lancet* April 5, 1969, pp. 692-694. H9,851/69

Psychogenic stress increased blood pressure as well as EP and NEP excretion in hypertensives more than in normotensives, although the resting catecholamine levels were essentially the same in both groups.

Bellet, S., Roman, L., Kostis, J.: "The effect of automobile driving on catecholamine and adrenocortical excretion." *Am. J. Cardiol.* **24**: 365-368 (1969). H16,504/69

In patients with CHD and in controls, "excretion of both catecholamines and 11-OHCS was found to be significantly in-

creased during a two hour period of driving compared with a two hour control period. These results suggest that automobile driving represents a mental stress.... The electrocardiographic changes (ischemic type of S-T segment depression or frequent premature ventricular contractions, or both) which occur during driving in subjects with coronary artery disease are induced by this stress."

McDonald, L., Baker, C., Bray, C., McDonald, A.: "Plasma-catecholamines after cardiac infarction." *Lancet* November 15, 1969, pp. 1021-1023. H18,916/69

In racing drivers, plasma NEP levels were greatly raised immediately after the race. Following cardiac infarction, "patients with atrial dysrhythmias or early ventricular dysrhythmias had higher noradrenaline concentrations in their plasma. There was no such difference for patients with late ventricular dysrhythmias, and adrenaline levels were unremarkable. The raised noradrenaline levels are not thought to be related to stress because six other patients undergoing the stressful procedure of cardiac catheterisation had low levels."

Carruthers, M. E.: "Aggression and atherosclerosis." *Lancet* November 29, 1969, pp. 1170-1171. H19,421/69

Evaluation of the literature shows that various stresses of daily life, especially fear, hatred, aggression and frustration, increase catecholamine and particularly NEP secretion, and raise the plasma levels of FFA and triglycerides. The latter can be deposited in vessel walls, and since they also augment platelet adhesiveness, may lead to thrombosis. "This hypothesis suggests that in modern society wrath, reinforced by sloth and gluttony, is the deadliest of the seven sins."

Lorimer, A. R., Macfarlane, P. W., Provan, G., Duffy, T., Lawrie, T. D. V.: "Blood pressure and catecholamine responses to 'stress' in normotensive and hypertensive subjects." *Cardiovasc. Res.* **5**: 169-173 (1971). J21,255/71

When exposed to the stressor effect of a monotonous but attention-demanding task (sorting steel balls), patients with sustained hypertension exhibited approximately the same increase in catecholamine production as normotensive controls.

Gödicke, W., Graff, C., Baumann, R., Naumann, E., Ziprian, H.: "Die Beeinflussung der Serumlipide, des Plasma-Kortisol und der 3-Methoxy-4-hydroxy-mandelsäure-Aus-

scheidung bei essentiellen Hypertonikern durch eine experimentell erzeugte psychische Stress-Situation" (Influence of experimentally-produced mental stress on serum lipids, plasma cortisol and 3-methoxy-4-hydroxy-mandelic acid excretion in essential hypertension). *Dtsch. Gesundheitsw.* **26**: 1973-1976 (1971). J23,736/71

Hypertensive patients "manifested a significant rise of the free fatty acids, of triglycerides, of phospholipids and of cortisol in the serum and plasma, as well as an increased 3-methoxy-4-hydroxy-mandelic acid excretion in the urine. The results indicate that essential hypertonics react more sensitively to psychic stress than normotonics."

Jäättelä, A., Tammisto, T., Nikki, P., Takki, S.: "Effect of operative stress on plasma catecholamines in treated and untreated hypertensive patients." *Ann. Clin. Res.* **4**: 84-88 (1972). H75,923/72

In hypertensive patients pretreated with methyldopa, the mean arterial pressure and plasma NEP fell at the time of operative stress. On the whole, the blood pressure and heart rate seemed more stable in treated than in untreated hypertensives.

Argüelles, A. E., Hoffman, C., Chekherdemian, M., Cervetto, A.: "Corticoadrenal and adrenergic overactivity in male patients with chronic myocardial infarction." *J. Steroid Biochem.* **4**: 427-432 (1973).

J16,684/73

Even long after recovery, patients who suffered myocardial infarction show an increased EP secretion in response to audio-genic stress, and a high basic plasma 11-OHCS concentration. This endocrine derangement may predispose to myocardial necrosis of the ESCN type.

O'Boyle, A., Gannon, D., Hingerty, D.: "Sympatho-adrenal response to stress." *J. Ir. Med. Assoc.* **66**: 699-704 (1973).

J10,153/73

Review of the sympathoadrenal participation in stress, with personal observations "on cardiac infarct patients, normal and toxemic pregnant subjects and on subjects undergoing various forms of athletic stress."

Esler, M. D., Nestel, P. J.: "High catecholamine essential hypertension: clinical and physiological characteristics." *Aust. N.Z.J. Med.* **3**: 117-123 (1973).

J3,376/73

In 20 percent of patients with sustained essential hypertension, urinary NEP levels

were elevated. "Plasma volume, the responsiveness of the sympathetic nervous system, renin-angiotensin status, indices of emotional stress, and 'hyperkinetic circulatory state,' all proved to be unrelated to basal noradrenaline excretion. Urinary noradrenaline was related only to the level of the blood pressure, being highest in patients with more severe hypertensive disease."

Oparil, S., Haber, E.: "The renin-angiotensin system. (Second of two parts)." *N. Engl. J. Med.* **291**: 446-457 (1974).

H90,100/74

A review of the renin-angiotensin system in hypertension, with special reference to the role of electrolytes and mineralocorticoids (376 refs.).

Ledingham, J. M.: "Ätiologie und Pathogenese der Hypertonie" (Etiology and pathogenesis of hypertension). *Internist* (Berlin) **15**: 114-123 (1974).

H86,141/74

Review of hypertension as a stress-induced disease in which increased catecholamine and mineralocorticoid production often plays a role and emotional factors are particularly common eliciting agents.

Distler, A.: "Ist die essentielle Hypertonie noch eine Krankheitseinheit? Abgrenzung der hyporeninämischen Hypertonie" (Is essential hypertension still a disease entity? Definition of hypo-reninemic hypertension). *Internist* (Berlin) **15**: 146-154 (1974).

H86,145/74

Hypo-reninemic hypertension is probably a pluricausal disease of variable etiology, although in many cases it depends on increased production of some mineralocorticoids (69 refs.).

Kimura, K.: "Pathophysiological significance of sympathetic activity in cardiovascular diseases." *Jap. Circ. J.* **38**: 181-194 (1974).

H88,882/74

In essential hypertension, urinary catecholamine excretion after exercise is somewhat above normal, and the responsiveness of the adrenergic system to neurogenic stressors is also elevated in CHD. The excessive vascular responses are readily suppressed by β -adrenergic blocking agents.

Vlachakis, N. D., Guia, D. de, Mendlowitz, M., Antram, S., Wolf, R. L.: "Hypertension and anxiety. A trial with epinephrine and norepinephrine infusion." *Mt. Sinai J. Med.* **41**: 615-625 (1974).

J16,758/74

In patients, anxiety and anxiety hyperten-

sion may be attributable as much to increased vascular responsiveness to EP as to excessive EP secretion (25 refs.).

Baumann, R.: "Theoretische und klinische Aspekte der zerebroviszeralen Regulationskrankheit arterielle essentielle Hypertonie. I. Zu Problemen der Adaptations-Maladaptionsprozesse und der pathogenetischen Effizienz des psychoemotionalen Stresses" (Theoretical and chemical analyses of cerebro-visceral regulation of essential arterial hypertension. I. Problems of adaptation-maladaptation processes and the pathogenetic efficiency of psycho-emotional stress). *Dtsch. Gesundheitsw.* **29**: 673-676 (1974).

J15,328/74

Baumann, R.: "II. Hämodynamische und biochemische Regulationsstörungen des jugendlichen Hypertoniens unter Stressexposition" (II. Hemodynamic and biochemical disturbances in young male hypertensive patients under stress). *Dtsch. Gesundheitsw.* **29**: 721-733 (1974).

J15,329/74

In young hypertensive patients with or without latent diabetes, emotional stress produced a rise in plasma FFA, NEP and renin (63 refs.).

Klein, R. F., Garrity, T. F., Gelein, J.: "Emotional adjustment and catecholamine excretion during early recovery from myocardial infarction." *J. Psychosom. Res.* **18**: 425-435 (1974) (35 refs.).

J19,268/74

Naftchi, N. E., Wooten, G. F., Lowman, E. W., Axelrod, J.: "Relationship between serum dopamine- β -hydroxylase activity, catecholamine metabolism, and hemodynamic changes during paroxysmal hypertension in quadriplegia." *Circulat. Res.* **35**: 850-861 (1974).

H97,485/74

Observations on patients "indicate that hypertension in quadriplegia, whether spontaneous or induced, is caused by increased release of norepinephrine and that the half-life of dopamine- β -hydroxylase released during stress is shorter than that previously reported."

Beevers, D. G., Nelson, C. S., Padfield, P. L., Barlow, D. H., Duncan, S., Greaves, D. A., Hawthorne, V. M., Morton, J. J., Young, G. A. R., Young, J.: "The prevalence of hypertension in an unselected population, and the frequency of abnormalities of potassium, angiotensin II and aldosterone in hypertensive subjects." *Acta Clin. Belg.* **29**: 276-280 (1974).

J21,482/74

An epidemiologic study of three thousand subjects aged forty-five to sixty-four revealed no cases of primary hyperaldosteronism among those having the most severe hypertension. A frequency distribution curve for plasma angiotensin II concentration in this group showed "no evidence of a subpopulation of subjects with low levels." However, occasionally, patients with high plasma angiotensin II or aldosterone were noted.

Palem-Vliers, M., Genard, P., Eechaute, W.: "La détection de la 18-hydroxy-11-désoxcorticostérone et de deux substances inconnues dans les urines de malades hypertendus. Isolement d'une de ces substances" (Detection of 18-hydroxy-11-desoxycorticosterone and two unknown substances in the urine of hypertensive patients. Isolation of one of these substances). *Acta Clin. Belg.* **29**: 281-282 (1974).

J21,483/74

Cope, C. L., Loizou, S.: "Deoxycorticosterone excretion in normal, hypertensive and hypokalaemic subjects." *Clin. Sci. Mol. Med.* **48**: 97-105 (1975).

J21,280/75

Radioimmunoassays did not detect a constant increase in the urinary DOC excretion of hypertensive patients. However, "of nine subjects showing hypokalaemia, eight had elevated excretion of deoxycorticosterone with values from 263 to 5515 pmol (87-1820 ng) daily. Seven of these were hypertensive and two were normotensive."

Nonhormonal Metabolites. Hammarsten, J. F., Cathey, C. W., Redmond, R. F., Wolf, S.: "Serum cholesterol, diet and stress in patients with coronary artery disease." *J. Clin. Invest.* **36**: 897 (1957).

D32,061/57

In survivors of myocardial infarction, serum cholesterol values were routinely taken and stressful life events registered. "It was striking that 19 of the 20 occasions of high cholesterol corresponded with periods that had been separately judged as particularly stressful for the individuals concerned."

Jolliffe, N.: "Fats, cholesterol, and coronary heart disease. A review of recent progress." *Circulation* **20**: 109-127 (1959).

G61,930/59

In a review on the role of fats and cholesterol in CHD, emphasis is placed upon stress which raises both serum cholesterol and FFA. It is doubtful whether the stressors of ancient times (constant fight for physical

survival) were more damaging in this respect than those of urbanization. Mortality rates from CHD were no higher in England than in the U.S.A. during the Battle of Britain, and they actually decreased in Norway during the German occupation. However, these results were greatly influenced by conditioning factors such as wartime nutrition and hence are difficult to interpret (85 refs.).

Wolf, S., McCabe, W. R., Yamamoto, J., Adsett, C. A., Schottstaedt, W. W.: "Changes in serum lipids in relation to emotional stress during rigid control of diet and exercise." *Circulation* **26**: 379-387 (1962).

J10,367/62

Striking increases in serum cholesterol and triglycerides occurred in people kept on a constant diet and exposed to various situations inducing anxiety, including difficulties in the family, on the job and so on. Stressful interviews caused such changes within sixty minutes. "No inferences are drawn with respect to the significance of emotional stress in the pathogenesis of coronary atherosclerosis or myocardial infarction, but it is clear that the mechanisms that govern the serum concentration of certain lipids are connected with and capable of responding to impulses from the higher centers of the brain."

Jayle, M. F.: "Rôle du métabolisme des glycoprotéines dans la biogénèse de l'athérosclérose. Concept sur le 'syndrome général de l'agression'" (Role of the metabolism of glycoproteins in the biogenesis of atherosclerosis. Concept of the "general stress syndrome"). *Ann. Thér.* **14**: 11-22 (1963).

G63,439/63

Under various stress conditions, the plasma levels of fibrinogen and of the glycoproteins haptoglobin and seromucoid are characteristically increased; this may play an important part in stress-induced atherosclerosis. The common denominator of the diseases of adaptation and of stress responses may be a rise in these compounds, which might thus correspond to the "first mediator." This interpretation might act as a valid focal point of Selye's "unitary concept" although the claims concerning the central role of the pituitary-adrenal axis are rejected.

Thomas, C. B., Ross, D. C.: "Observations on some possible precursors of essential hypertension and coronary artery disease. VIII. Relationship of cholesterol level to certain habit patterns under stress." *Bull. Johns Hopkins Hosp.* **113**: 225-238 (1963).

E29,405/63

Among medical students exposed to diverse psychogenic stressors, a questionnaire showed marked individual differences in responses.

Frequency distribution of positive responses to habits of nervous tension items by 1085 medical students

Habits of Nervous Tension	Positive Responses	
	No.	(%)
Exhaustion	157	(14.5)
Exhilaration	227	(20.9)
Depressed feelings	216	(19.9)
Uneasy or anxious feelings	526	(48.5)
General tension	871	(80.3)
Increased activity	709	(65.3)
Decreased activity	55	(5.1)
Increased urge to sleep	154	(14.2)
Increased difficulty in sleeping	483	(44.5)
Increased urge to eat	200	(18.4)
Loss of appetite	402	(37.0)
Nausea	66	(6.1)
Vomiting	10	(0.9)
Diarrhoea	163	(15.0)
Constipation	48	(4.4)
Urinary frequency	341	(31.4)
Tremulousness	172	(15.9)
Anger	233	(21.5)
Gripe sessions	173	(15.9)
Concern about physical health	47	(4.3)
Tendency to recheck work	254	(23.4)
Urge to confide	293	(27.0)
Urge to be alone	221	(20.4)
Irritability	97	(8.9)
Philosophic effort	255	(23.5)
Total	6373*	

* 5.9 positive responses per subject (range 0 to 21).

(Adapted from *Bulletin Johns Hopkins Hospital* **113** (1963) by permission.)

The blood cholesterol levels usually increased, but the reverse also occurred occasionally. "Subjects in the lower cholesterol group more often reported loss of appetite, exhaustion, nausea and anxiety when under

stress; in addition, urge to be alone, tremulousness and depression were more frequent than expected, although these items only approached significance. The only item with a significant positive relationship to higher cholesterol levels was urge to eat" (35 refs.).

Hoch-Ligeti, C.: "Adrenal cholesterol concentration in cases of suicide." *Br. J. Exp. Pathol.* 47: 594-598 (1966). F65,019/66

The highest adrenal cholesterol concentrations were found in patients who committed suicide and in hypertensives, being much above those of persons who died in accidents. Presumably the changes are related to stress.

Chapman, J. M., Reeder, L. G., Massey, F. J. Jr., Borun, E. R., Picken, B., Browning, G. G., Coulson, A. H., Zimmerman, D. H.: "Relationships of stress, tranquilizers, and serum cholesterol levels in a sample population under study for coronary heart disease." *Am. J. Epidemiol.* 83: 537-547 (1966).

J15,961/66

Válek, J., Kuhn, E.: "Stress-induced changes of carbohydrate and lipid metabolism in coronary heart disease." *Psychother. Psychosom.* 18: 275-280 (1970).

J19,062/70

E9,671/72

Monograph in which many contributors present their data concerning myocardial metabolism and pathology. Special attention is given to the roles of dietary factors, corticoids, catecholamines and stress (several hundred refs.).

Seelig, M. S., Heggtveit, H. A.: "Magnesium interrelationships in ischemic heart disease: a review." *Am. J. Clin. Nutr.* 27: 59-79 (1974).

J10,135/74

A review of clinical data and earlier animal experiments showing the prophylactic value of magnesium salts against stress-induced and other types of infarctoid myocardial necrosis. "Its role in maintaining normal rhythmicity in the heart in the face of an ischemic insult may well explain the difference in sudden cardiac death rates in hard and soft water areas. Therapeutic use of magnesium in acute ischemic heart disease may well be justified" (228 refs.).

Theories. Brunner, H. R., Gavras, H., Laragh, J. H.: "Specific inhibition of the renin-angiotensin system: a key to understanding blood pressure regulation." *Prog. Cardiovasc. Dis.* 17: 87-98 (1974).

J16,270/74

With inhibitors of various parts of the renin-angiotensin system being used, blood pressure regulation is viewed and described in Figure 4 (p. 793).

Two models of renal hypertension served for the development of this concept. "Established two-kidney Goldblatt hypertension (one renal artery clipped, contralateral kidney intact) was found to be renin-dependent, since angiotensin II blockade induced a marked fall in blood pressure. Clinical counterparts to this predominantly "vasoconstrictor" type of hypertension are renovascular hypertension with unilateral renal artery stenosis, malignant and essential hypertension with high renin levels, and possibly normotensive situations with reduced "effective" blood volume such as cirrhosis and congestive heart failure.

"Chronic one-kidney Goldblatt hypertension (one renal artery clipped, contralateral nephrectomy) under conditions of unrestricted sodium intake appeared on the other hand to be predominantly sodium-volume-dependent, so that angiotensin II blockade did not alter the pressure level. However, sodium (and volume) depletion did not lower the blood pressure either in this model but resulted instead in a compensatory rise of renin release, and thus in a transition from a sodium-volume to vasoconstrictor-maintained type of hypertension. Accordingly, under conditions of sodium depletion, angiotensin II blockade did markedly reduce the blood pressure. Clinical counterparts to this model in which simultaneous sodium depletion plus blockade of the renin system are necessary to reduce blood pressure appear to be most patients with normal renin essential hypertension, chronic renal failure with normal or low renin levels, renovascular hypertension with bilateral renal artery stenoses, and possibly coarctation of the aorta.

"In contrast to these two model situations, low-renin essential hypertension as well as the hypertension induced by an excess of various mineralocorticoids appears to represent a pure volume type of hypertension, in which a diuretic-induced volume reduction does not result in a compensatory rise in renin release and a shift to vasoconstrictor

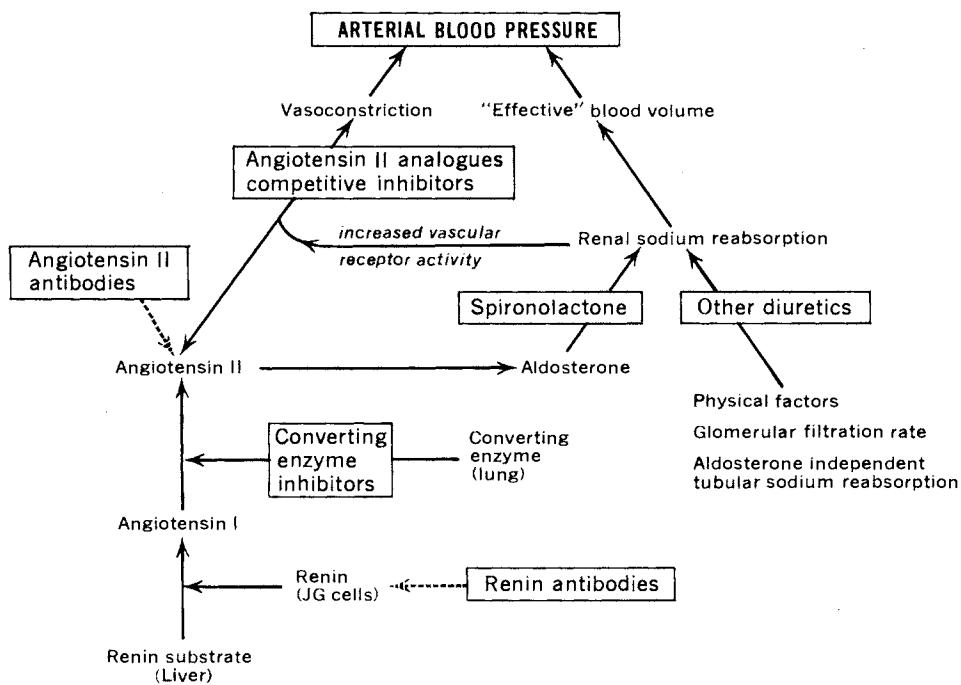

Figure 4. Synergism of the angiotensin II vasoconstrictor and the sodium-volume components in sustaining arterial blood pressure.

Points of action within the system of the various inhibitors and sodium-depleting agents are depicted in framed letters.

support but instead results in a parallel reduction of blood pressure" (59 refs.).

Gavras, H., Brunner, H. R., Laragh, J. H.: "Renin and aldosterone and the pathogenesis of hypertensive vascular damage." *Prog. Cardiovasc. Dis.* 17: 39-49 (1974).

J14,021/74

Largely on the basis of the evidence discussed by Brunner *et al.* (J16,270/74), the mechanisms of the two principal types of hypertension are depicted in Figure 5 (p. 794).

"Both forms induce arteriolar narrowing, impaired arteriolar wall and tissue perfusion, transudation, plasmatic vasculosis, pressure natriuresis, hemoconcentration, fibrin deposition, and, finally, fibrinoid necrosis. In the case of salt hypertension, vasoconstriction may not be present, but it is replaced by edema of the arteriolar wall. With this hypothesis, all vascular changes in chronic hy-

pertension can be explained in terms of an inappropriate interaction between a vasoconstrictor component (largely angiotensin) and a volume factor (determined by renal excretory capacity modulated by aldosterone)."

Experimental Cardiovascular Diseases

Generalities. Work on the role of *stress* in the production of experimental cardiovascular diseases has been reviewed extensively in my two-volume monograph, *Experimental Cardiovascular Diseases*. Hence, to avoid unnecessary duplications, I shall limit myself here to a brief mention of the most salient facts and the citation of a few key references.

In essence, it may be said that depending upon conditioning factors (particularly previous exposure to stress, age, genetic predisposition, the hormonal and nutritional status of the subject), stress may produce or inhibit the development of cardiovascular diseases, but it virtually always influences their course in some respect.

Most of the experimental work in this field has been done to establish the role of stress, or of hormones produced during stress, in **hypertension** with the associated renal and cardiovascular lesions. These include **arteriosclerosis** (of both the atheromatous and the purely calcifying type), **myocardial** necroses (caused either by vascular occlusion or by disturbances of cardiac metabolism) and thrombohemorrhagic phenomena.

In general, it may be said that malignant hypertension with **hyalinizing** cardiovascular and renal disease is most easily reproduced in rats by chronic stress on high sodium diets, especially after sensitization by uninephrectomy. Indeed, in unilaterally nephrectomized rats kept on high sodium diets, mineralocorticoids (DOC, aldosterone), STH, or MAD (which probably causes the adrenals to produce mineralocorticoids), easily induce such lesions by themselves, without exposure to stress.

Corticoids undoubtedly play a decisive role here and a mutual feedback mechanism exists between mineralocorticoids (particularly aldosterone) and the renal pressor system in that renin stimulates aldosterone production whereas aldosterone inhibits renin secretion. This interplay helps to maintain pressor homeostasis under ordinary conditions. However, if the feedback mechanism is defective and intense nephrosclerosis is produced, the blood pressure rises to a level where it further damages the kidney and a vicious circle develops. Possibly, some corticoids can induce nephrosclerosis and hypertension without raising renin production ("hyporeninemic hypotension"); thus, the rise in blood pressure is deprived of its self-inhibitory properties and becomes self-perpetuating and independent of renin.

Although this mechanism is far from being adequately proven by experimental evidence, it is obvious that the adrenal cortex plays a decisive role in the production of many types of hypertensive disease. Thus, in **adrenalectomized** rats kept on a fixed dose of glucocorticoids just sufficient to maintain life, neither stress, MAD nor STH can exert their usual hypertensive, vasotoxic and nephrosclerotic effects, even if the animals are maximally sensitized by uninephrectomy and a high sodium chloride intake. Yet in adrenalectomized rats, under similar conditions, exogenous mineralocorticoids retain their pressor vasotoxic and nephrotoxic actions. Therefore, it is postulated that stress, MAD and STH do not act directly upon the vascular system but through the intermediary of the adrenals in which they stimulate the synthesis of mineralocorticoids under certain conditions.

The so-called **adrenal regeneration hypertension (ARH)** has furnished us with another convenient tool for studying mineralocorticoid hypertension and proving that the production of excessive or abnormal adrenal corticoids may cause hypertensive disease. If one adrenal is removed and the other "demedullated" (an operation that also removes virtually the entire cortex except the glomerulosa), nephrosclerotic hypertension de-

velops with vascular lesions which are indistinguishable from those produced by DOC. Unilateral nephrectomy in rats on a high sodium chloride intake sensitizes for this effect, just as it does for the comparable actions of mineralocorticoids. There is much evidence supporting the view that in rats subjected to this operation, the regenerating adrenal cells of the subcortical layer produce an excessive amount of DOC and related steroids which have a high vasotoxic effect.

The pressor actions of catecholamines are transitory and hardly ever conducive to self-perpetuating nephrosclerotic hypertension. EP and NEP are effective even in the absence of the adrenals, but appear to potentiate the characteristic vasotoxicity of mineralocorticoids and hence probably play an important part in stress-induced hypertensive disease. Their increased secretion during stress may also raise the coagulability of blood and thereby predispose to stress-induced occlusive vascular thrombosis.

The *electrolyte steroid cardiopathies with necrosis (ESCN)* are produced in experimental animals, particularly in rats, by the conjoint administration of glucocorticoids and mineralocorticoids, or by steroids (for example, fluorocortisol) that exert both gluco- and mineralocorticoid actions, but only if this treatment is combined with a high sodium diet or with exposure to sudden stress. A great variety of stressors have proved effective in eliciting this manifestation after conditioning with corticoids and sodium. On the other hand, diets poor in sodium or rich in potassium and/or magnesium, as well as potassium-sparing agents (spironolactone, amiloride) protect against this type of cardiac lesion. Many of these experimental observations have found clinical application in the therapeutic use of low sodium, high potassium, or high magnesium diets, spironolactone and amiloride for cardiovascular disease.

It is also of interest that high fat diets are particularly effective in causing cardiac necroses in rats pretreated with appropriate corticoids and high sodium diets. In this respect, they may replace stressors.

Finally, it should be mentioned that in rats under identical conditions, acute exposure to *stress* (forced muscular exercise, restraint, traumatic injuries) *may produce or prevent cardiac necrosis*, depending upon circumstances. Gradual pretreatment with stressors, especially forced muscular exercise, can protect the fully-conditioned rat (essentially a "coronary candidate") against the induction of cardiac necrosis by a subsequent extremely severe stress.

These findings further suggest close relationships between the experimental cardiopathies and their clinical equivalents. They may explain the long-puzzling paradox that exercise is considered to be dangerous and also to be of prophylactic value in patients prone to cardiac infarction. Presumably, keeping fit through gradual comparatively mild exercise induces considerable resistance, whereas sudden extreme muscular effort may precipitate a cardiac accident, especially in persons used to sedentary life and unadapted to muscular effort.

It must be kept in mind, however, that unlike many patients who die from acute coronary accidents, the ESCN of the rat is not primarily due to coronary thrombosis, but to metabolic derangements in the cardiac muscle that predispose it to necrosis at times of increased demands for work. Only secondarily do thromboses tend to develop in necrotic areas of the heart, where the endothelium of the coronary vessels has lost its anticoagulant properties. In this connection, it is of particular interest that several investigators observed an inverse relationship between the incidence of detectable coronary thromboses and the rapidity with which a patient died after clinical manifestations of a heart attack. It has been deduced that probably sudden cardiac

death in man is often due primarily to *metabolic myocardial necrosis* and that the occlusive thrombus develops only secondarily in the dead myocardial region.

So-called "*fuchsinophilic degeneration*" frequently precedes myocardial necrosis in man (as indicated by histologic investigations in patients who died very suddenly after an accident) and in experimental animals during the ESCN.

After this extensive general survey, we need not discuss here the literature on each point separately. The reader is referred to my above-mentioned earlier monograph and to a few key references listed and abstracted under separate headings below.

In rats, hypertension was produced by

combined sound, light and electric stimulation and the associated EEG changes were registered.

Rosecrans, J. A., Watzman, N., Buckley, J. P.: "The production of hypertension in male albino rats subjected to experimental stress." *Biochem. Pharmacol.* **15**: 1707-1718 (1966). G42,049/66

In rats subjected "to a chronic variable stress program consisting of flashing lights, audiogenic stimulation, and oscillation," hypertension developed after several months. This was associated with an increase in catecholamine excretion that disappeared after several weeks, and a rise in plasma corticosterone that tended to persist. "These results suggest that the adrenal glands had become more efficient in the rate of synthesis and release of steroids after chronic exposure to the stressors."

Buckley, J. P., Vogen, E. E., Kinnard, W. J.: "Effects of pentobarbital, acetylsalicylic acid, and reserpine on blood pressure and survival of rats subjected to experimental stress." *J. Pharm. Sci.* **55**: 572-575 (1966). F67,051/66

Chronic exposure of rats to a variety of stressors (strong light, sound, electric shock) produces hypertension, which is not prevented by pentobarbital or acetylsalicylic acid but is diminished by reserpine. The ulcerogenic effect of stressors is aggravated by acetylsalicylic acid.

Fedoseev, A. N.: "Significance of the central nervous system stress in the development of experimental cholesterol atherosclerosis in dogs." *Patol. Fiziol. Éksp. Ter.* **11** No. 1-2: 35-38 (1967) (Russian).

J24,055/67

In dogs fed a high cholesterol diet, various psychogenic stressors intensified the development of atherosclerosis.

Shkhvatsabaia, I. K., Ananchenko, V. G.: "Mechanism of coronary thrombosis produced by neurogenic action on animals with experimental atherosclerosis." *Bull. Éksp. Biol. Med.* **63** No. 3: 28-31 (1967) (Russian). Engl. trans.: *Bull. Exp. Biol. Med.* **63**: 242-244 (1967). J24,293/67

Friedman, M., Byers, S. O., Brown, A. E.: "Plasma lipid responses of rats and rabbits to an auditory stimulus." *Am. J. Physiol.* **212**: 1174-1178 (1967). F83,722/67

"Rats exposed to a continuous sound stimulus having an intensity of 102 db and an in-

termittent sound stimulus (200-cycle square wave with a duration of about 1 sec and having an intensity of 114 db) exhibited marked elevation and prolongation of clearing of postprandial plasma triglyceride for a period of approximately 21 days.... Cholesterol-fed rabbits exposed to similar sound stimulus for 10 weeks exhibited a higher blood cholesterol and more intense atherosclerosis than similarly fed control animals."

Dahl, L. K., Knudsen, K. D., Heine, M., Leitl, G.: "Hypertension and stress." *Nature* **219**: 735-736 (1968). H1,538/68

In a strain of rats genetically predisposed to hypertension, various stressors (electroshock, sound, light) did not cause significant increases in blood pressure. "Our findings do not support the popular concept that stress is a usual or common aetiological factor of hypertension."

Buckley, J. P., Parham, C., Smookler, H. H.: "Effects of reserpine on rats subjected to prolonged experimental stress." *Arch. Int. Pharmacodyn. Ther.* **172**: 292-300 (1968). F99,053/68

Reserpine prevented the hypertension which develops in rats exposed to diverse stressors.

Smookler, H. H., Buckley, J. P.: "Relationships between brain catecholamine synthesis, pituitary adrenal function and the production of hypertension during prolonged exposure to environmental stress." *Int. J. Neuropharmacol.* **8**: 33-41 (1969).

H22,172/69

In rats, experimental hypertension produced by a variety of stressors is beneficially influenced by α -MT.

Wexler, B. C., Saroff, J.: "Divergent responses of arteriosclerotic and non-arteriosclerotic rats to a catabolic dose of cortisone." *Acta Endocrinol. (Kbh.)* **61**: 509-524 (1969).

H15,114/69

Repeatedly bred rats tend to develop spontaneous arteriosclerosis. Injections of cortisone aggravate this effect. "It is believed that the increased activity of the hypothalamic-pituitary-adrenal axis in repeatedly bred rats conditions the arterial wall towards rearrangement of connective tissue ground substance and elements and the development of arteriosclerosis, i.e., a hormonal basis for the pathogenesis of this model of cardiovascular disease."

Möglichkeiten der Ausarbeitung einer experimentellen neurotischen Hypertonie bei Hunden" (On the possibility of producing experimental neurotic hypertension in dogs). *Acta Biol. Med. Ger.* 24: 593-602 (1970).

J20,888/70

In dogs, chronic exposure to noise, electroshock or other aversive stimuli can produce a persistent hypertension.

Shimamoto, T., Kobayashi, M., Numano, F.: "Infiltration of γ -globulin, fibrinogen and β -lipoprotein into blood vessel wall by atherogenic stress visualized by immunofluorescence." *Proc. Jap. Acad.* 48: 336-341 (1972).

G98,558/72

"One shot treatment of rabbits with epinephrine or atherogenic substance induced an acute infiltration of γ -globulin, fibrinogen, and β -lipoprotein into the arterial wall with subendothelial stagnation, temporarily dammed by the internal elastic lamina. Gamma-globulin, fibrinogen, and β -lipoprotein are also visualized in chronic experimental atheromata. This model utilizes a physiological marker to study vascular permeability and suggests an important barrier function of the internal elastic lamina."

Rothfeld, B., Paré, W. P., Varady, A. Jr., Isom, K. E., Karmen, A.: "The effects of environmental stress on cholesterol synthesis and metabolism." *Biochem. Med.* 7: 292-298 (1973).

J2,491/73

In rats, the stressor effect of sound or electroshock caused cholesterol deposition in the aorta and liver with a rise in blood cholesterol.

Hecht, K., Poppei, M., Peschel, M., Trepotow, K., Moritz, V.: "Optimierungsaspekte in der zerebro-viszeralen Blutdruckregulation unter chronischem Einfluss kombinierter Stressoren" (Optimizing effects in cerebro-visceral blood pressure regulation following chronic exposure to combined stressors)." *Acta Biol. Med. Ger.* 31: 813-825 (1973).

J11,605/73

Observations on rats showed that "whereas chronic single presentation of stressors (learning, intermitting limitation of mobility) led to pronounced neurotically induced dysregulations of the blood pressure paralleling disturbances of the central nervous system and the carbohydrate metabolism, combination of the two stressors, or combination of one stressor with other environmental factors, produced an established compensatory effect." Presumably, treatment with a com-

bination of stressors need not entail summation of their effects in all respects (19 refs.).

Hauss, W. H.: "Tissue alterations due to experimental arteriosclerosis." In: Vogel, H. G., *Connective Tissue and Ageing* (Int. Congr. Ser. No. 264), pp. 23-33. Amsterdam: Excerpta Medica, 1973. J14,882/73

In rats the emotional stress produced by restraint elicits typical mesenchymal reactions in the blood vessel walls with increased ^{35}S -sulfate and ^3H -thymidine incorporation. Essentially similar changes occur after exposure to other stressors, and these are considered to be the first step in the arteriosclerotic process characteristic of aging. "The deformation of the structure of the arterial wall participates essentially in the development of lipidosis, fibrinosis, and cell necroses. Aggregation of thrombocytes and thrombosis in the arterial wall results from the frequent reduplication of intima cells."

Buckley, J. P.: "Biochemical and physiological effects of intermittent neurogenic stress." In: Németh, Š., *Hormones, Metabolism and Stress. Recent Progress and Perspectives*, pp. 165-177. Bratislava: Slovak Academy of Sciences, 1973. E10,466/73

Various stressors (sound, light, vibration) chronically applied to rats caused hypertension with an increased NEP turnover in the CNS. Possibly, "the chronic phase of the response is associated with an action of angiotensin II on central receptors."

Baumann, H., Hecht, K.: "Quantitative evoked-potential-Analysen zur neurophysiologischen Charakterisierung von Fehlernprozessen in der experimentellen arteriellen Hypertonie-Pathogenese" (Quantitative evoked-potential analyses for neuro-physiologic characterization of miscontrolled learning processes in the pathogenesis of experimental hypertension). *Acta Biol. Med. Ger.* 30: 675-696 (1973).

J7,760/73

In rats, the nervous stress of learning conditioned reflexes led to arterial hypertension. Using electrodes implanted in various parts of the brain and evaluating the data by computer analysis, the authors found a general impairment of bioelectric information processing as nervous stress increased. "The experimental evidence of stepwise involvement of limbic brain structures due to the increasing learning stress gives reason to assume a differentiated function of this system in organism-environment adaptation."

Hecht, K., Poppei, M., Hecht, T., Bau-

mann, H., Treptow, K., Moritz, V., Choinowski, S., Michailow, M., Schlegel, T.: "A model designed to study the role of stressing environmental factors in the pathogenesis and primary prevention of experimental neurotically-induced hypertension." *Proc. Satellite Symp. Emotions and Visceral Functions*, pp. 18-23. Baku, USSR, 1974 (Russian, with extensive English summary).

Hallbäck, M., Folkow, B.: "Cardiovascular responses to acute mental 'stress' in spontaneously hypertensive rats." *Acta Physiol. Scand.* **90**: 684-698 (1974).

J13,405/74

Genetically hypertensive rats showed more pronounced cardiovascular responses to the stressor effect of sound than did normotensive controls or renal hypertensive rats of a normal strain. Hence the hyperreactivity is genetically conditioned.

Wexler, B. C.: "Adrenocortical changes associated with methylandrostenediol-induced hypertension and isoproterenol-induced myocardial infarction in arteriosclerotic versus nonarteriosclerotic rats." *Lab. Invest.* **30**: 251-259 (1974).

J12,177/74

Repeatedly bred rats had naturally occurring arteriosclerosis and mild hypertension. If treated with isoproterenol, their mortality rate was high, serum triglycerides and cholesterol were greatly elevated, and the repair of drug-induced cardiac necroses was impeded by the formation of aneurysms. It is concluded that "preexisting, chronic, severe hypertension plays a key role in the pathogenesis of left ventricular aneurysm formation during acute myocardial infarction and that severe hypertension combined with arteriosclerosis portends a poor prognosis toward survival" (42 refs.).

Alexander, N.: "Psychosocial hypertension in members of a Wistar rat colony." *Proc. Soc. Exp. Biol. Med.* **146**: 163-169 (1974).

H87,183/74

Various social conditions (particularly aggregation and isolation) can cause hypertension in the rat.

Baumann, H., Urmantscheeva, T. G., Gurk, C., Martin, G., Wolter, F.: "Quantita-

tive evoked potential analyses in behavioural neurophysiology. A model of a stress-induced borderline hypertension in rhesus monkeys." *Acta Biol. Med. Ger.* **33**: 419-427 (1974).

J21,955/74

Friedman, R., Dahl, L. K.: "The effect of chronic conflict on the blood pressure of rats with a genetic susceptibility to experimental hypertension." *Psychosom. Med.* (In press).

J24,878/

Rats genetically susceptible to experimental hypertension were exposed to several aversive stimuli. "Despite weekly fluctuations, a pattern emerged wherein subjects exposed to an approach (food)-avoidance (shock) conflict usually exhibited the highest blood pressures followed closely by rats given the same amount of food and shock but independent of their behavior." Usually the blood pressures returned to normal after the stressful experience, but there was "some indication in a few rats that the 'stress-induced' elevations could be maintained for extended periods following removal of the stress."

Hyalinosis. Selye, H., Pentz, E. I.: "Pathogenetical correlations between periarteritis nodosa, renal hypertension and rheumatic lesions." *Can. Med. Assoc. J.* **49**: 264-272 (1943).

A59,789/43

First description of the technique for producing mineralocorticoid hypertension in uninephrectomized rats given one percent sodium chloride to drink. The rapidly developing high blood pressure is associated with "the hyalinosis syndrome," periarteritis nodosa, myocarditis and nephrosclerosis. Corresponding lesions in man may be "at least partly caused by an abnormal (probably excessive) adaptive response of the adrenal cortex and represent diseases of adaptation."

Selye, H.: "Hypertension as a disease of adaptation." *Rec. Prog. Horm. Res.* **3**: 343-361 (1948).

B1,433/48

Discussion of the role of stress in the development of hypertension with special reference to mineralocorticoids, sodium and Hypertensin (angiotensin).

Shorr, E.: "The American Journal of Medicine seminars on hypertension." *Am. J. Med.* **5**: 783-791 (1948).

B30,644/48

Review of experimental evidence on the humoral factors responsible for hypertension. Special emphasis is placed upon the probable

interrelations between mineralocorticoids, the renal pressor mechanism, VEM, and VDM.

Selye, H., Stone, H., Timiras, P. S., Schaffenburg, C.: "Influence of sodium chloride upon the actions of desoxycorticosterone acetate." *Am. Heart J.* **37**: 1009-1016 (1949).

B19,413/49

In rats kept on a sodium chloride-free diet, DOC fails to produce the usual fatal hypertensive cardiovascular disease. "From this, in conjunction with our previously published observations, it is concluded that sodium is essential for the renal, and, through the intermediation of the kidney, for the cardiovascular actions of desoxycorticosterone acetate."

Selye, H.: "Effect of desoxycorticosterone upon the toxic actions of somatotropic hormone." *Proc. Soc. Exp. Biol. Med.* **76**: 510-515 (1951).

B54,470/51

In uninephrectomized rats kept on a high sodium diet, STH produces results similar to the syndrome elicited by DOC: cardiac hypertrophy, myocarditis, hypertension, nephrosclerosis and polyuria. When STH and DOC are given simultaneously, all these actions are greatly increased, except for the hypertension which may be inhibited as a consequence of the pronounced edema and obvious physical deterioration. Even purified STH may stimulate the adrenal cortex or activate mineralocorticoids.

Salgado, E., Selye, H.: "The role of the thyroid in the production of cardiovascular and renal changes by methylandrostenediol." *J. Endocrinol.* **11**: 331-337 (1954).

B92,433/54

In rats sensitized by 1 percent sodium chloride and uninephrectomy, MAD causes accumulation of hyalin granules in adrenocortical cells, associated with nephrosclerosis, periarteritis nodosa, myocarditis and hypertension. These changes are prevented by adrenalectomy and presumably are due to the production of a DOC-like mineralocorticoid in the adrenals under the influence of MAD. Thyroidectomy diminishes the formation of these hyalin granules and dissociates the other actions of MAD so that nephrosclerosis, myocarditis and hypertension are largely inhibited, but polyuria, thymic involution and all the effects typical of androgens remain uninfluenced, while the severity of mesenteric periarteritis nodosa is aggravated. The reason for this dissociation remains to be explained.

Skelton, F. R.: "Experimental hypertensive vascular disease in the rat. A histopathologic study of the lesions produced by methylandrostenediol and desoxycorticosterone acetate." *Arch. Pathol.* **66**: 190-200 (1955) (26 refs.).

G61,768/55

Skelton, F. R.: "Effects of urea on the hypertension and vascular lesions produced in the rat by methylandrostenediol and desoxycorticosterone acetate." *Lab. Invest.* **6**: 266-274 (1957).

C36,541/57

Detailed description of factors influencing the development of vascular lesions in rats made hypertensive by uninephrectomy plus sodium chloride in combination with MAD or DOC. "These results suggest that the vascular lesions produced by these steroids are not the result of an elevated blood pressure per se, and the suggestion is made that the pathogenesis of these lesions may involve some metabolic action on the vessel wall."

Ingle, D.: "Current status of adrenocortical research." *Am. Sci.* **47**: 413-426 (1959).

D41,791/59

In rats, excessive sodium chloride intake can cause hypertension, and concurrent treatment with corticoids greatly accelerates its development. "This is the basis for my claim that the primary cause of pathology in the Selye experiments is the trouble the animal is having with electrolytes: the sodium-retaining steroids play a 'conditioning' role—to use Selye's word—when they are present."

Hall, C. E., Hall, O.: "Enhancement of somatotropic hormone-induced hypertensive cardiovascular disease by stress." *Am. J. Physiol.* **197**: 702-704 (1959).

C74,782/59

Skelton, F. R., Brownie, A. C., Nickerson, P. A., Molteni, A., Gallant, S., Colby, H. D.: "Adrenal cortical dysfunction as a basis for experimental hypertensive disease." *Circ. Res.* **24** Supp. 1: I-35-I-57 (1969).

H13,163/69

In suitably conditioned rats a similar hypertensive cardiovascular disease was produced by adrenal regeneration, MAD, methyltestosterone, testosterone or metyrapone. "The development of all these forms of experimental hypertension was accompanied by inability of homogenized adrenal tissue or isolated mitochondria to 11 β -hydroxylate deoxycorticosterone to corticosterone readily, thereby allowing deoxycorticosterone to accumulate in the incubation media."

Selye, H.: *Experimental Cardiovascular Diseases*, 2 vols., p. 1155. New York, Heidelberg and Berlin: Springer-Verlag, 1970.

G60,083/70

Extensive monograph surveying virtually the entire literature on experimental cardiovascular diseases produced by stressors, mineralocorticoids, MAD, ARH, and the ESCN.

Stárka, L., Motlík, K.: "Suppression of adrenocortical steroid biosynthesis by methylandrostanediol in rats." *Acta. Univ. Carol. [Med.]* (Praha) **17**: 457-466 (1971).

H76,969/71

Review of the literature on the production of hypertensive cardiovascular disease by MAD. Personal observations with radio-carbon-marked steroids confirm that in the rat MAD depresses the synthesis of various corticoids but increases that of DOC. This process is associated with the formation of hyalin droplets and certain enzymatic derangements in the outer cortex; hence, MAD hypertension depends upon the presence of the adrenals.

Dusting, G. J., Rand, M. J.: "An anti-hypertensive action of propranolol in DOCA/salt-treated rats." *Clin. Exp. Pharmacol. Physiol.* **1**: 87-98 (1974).

J13,425/74

In rats made hypertensive by DOC plus sodium chloride, propranolol and guanethidine diminish the blood pressure. Various experiments suggest that the antihypertensive

effect of propranolol in this case is due not to adrenergic neurone blockade or to its pronounced specific depressant action, but to central impairment of sympathetic activity.

Svendsen, U. G.: "Thymus dependency of periorteritis nodosa in DOCA and salt treated mice." *Acta Pathol. Microbiol. Scand. [A]* **82**: 30-34 (1974).

J16,185/74

Severe periorteritis nodosa develops in the kidneys, with fewer lesions in the heart and pancreas, in unilaterally nephrectomized, hairless NMRI mice treated with DOCA plus sodium chloride, but not in littermates with congenital thymus aplasia.

Infarctoid Necroses. Selye, H.: *The Chemical Prevention of Cardiac Necroses*, p. 235. New York: Ronald Press, 1958.

C50,810/58

Detailed review of the experimental observations that led to the concept of "metabolic cardiac necroses," in which biochemical changes within the myocardium, rather than primary occlusion of the coronary arteries, are the causative factor. After they are suitably conditioned with various corticoids and high sodium diets, animals readily respond to stress with infarctoid myocardial necroses, which can be prevented by low sodium or high potassium diets. Magnesium and chloride ions also exert some protective effect, whereas dietary excessive saturated or unsaturated fatty acids facilitate the production of metabolic cardiac necroses in animals.

Selye, H.: "Wechselwirkungen zwischen Stress, Elektrolyten und Steroiden beim Entstehen verschiedener Kardiopathien und Myopathien" (Reciprocal actions between stress, electrolytes and steroids in the pathogenesis of various cardiopathies and myopathies). *Endokrinologie* **38**: 195-217 (1959).

C61,814/59

Relationships between stress, electrolytes and steroids in the pathogenesis of experimental cardiac diseases.

Selye, H.: *Elektrolyte, Stress und Herznekrose* (Electrolytes, stress and cardiac necroses), p. 228. Basel and Stuttgart: Benno Schwabe Verlag, 1960.

G59,114/67

In rats, combined treatment with strong stressors and corticoids produces infarctoid myocardial necroses, probably due to cardiac potassium depletion.

Raab, W.: "Myocardial metabolic vulnerability—key problem in pluricausal 'coronary' heart disease." *Cardiologia* **52**: 305-317 (1968).

G66,002/68

Review of the literature and particularly of the experiments with various forms of the ESCN led to the conclusion that "the traditional, one-sided view of 'coronary' degenerative heart disease as a purely vascular problem is currently replaced by a pluricausal concept. Coronary atherosclerosis constitutes an important predisposing element. However, attention is increasingly focused on cell vulnerability-determining derangements of myocardial metabolism which complicate and often decisively aggravate the cardiac pathogenicity of vascular lesions within the heart muscle itself." Major emphasis is laid upon the conditioning of the cardiac muscle by catecholamines and corticoids which predisposes the myocardium to necrosis following subsequent exposure to stress.

Selye, H., Somogyi, A., Savoie, L.: "Prevention of stress-induced cardiac necrosis by amiloride." *Angiologica* (Basel) **6**: 249-254 (1969).

Discussion of the ESCN as an experimental model of stress-induced cardiac necrosis.

Héroux, O.: "Physiological adjustments responsible for metabolic cold adaptation and possible deleterious consequences." *Rev. Can. Biol.* **33**: 209-222 (1974).

H97,110/74

Review of metabolic changes produced by cold in various mammals. Increased energy utilization may participate in stress-induced myocardial necroses.

Johansson, G., Jonsson, L., Lannek, N., Blomgren, L., Lindberg, P., Poupa, O.: "Severe stress-cardiopathy in pigs." *Am. Heart J.* **87**: 451-457 (1974).

H85,436/74

"In 23 healthy young pigs stress was produced by preventing escape behavior by pharmacologic restraint (Celocurin chloride)." All of them developed infarctoid myocardial necroses which were sometimes fatal.

Adrenal Regeneration Hypertension. Skelton, F. R., Guillebeau, J.: "The influence of age on the development of adrenal-regeneration hypertension." *Endocrinology* **59**: 201-212 (1956).

C22,147/56

The cardiovascular lesions characteristic of ARH are most evident in young rats, perhaps because STH secretion is particularly intense during growth.

Skelton, F. R.: "Production and inhibition of hypertensive disease in the rat by corticosterone." *Endocrinology* **62**: 365-368 (1958). C48,928/58

The hypertension produced in uninephrectomized, salt-treated rats by adrenal enucleation can be prevented by corticosterone, which interferes with adrenal regeneration.

Skelton, F. R.: "A study of the natural history of adrenal-regeneration hypertension." *Circ. Res.* **7**: 107-117 (1959) (21 refs.). C63,136/59

Skelton, F. R., Brownie, A. C.: "Adrenal-regeneration hypertension. An enigma." In: Bajusz, E. and Jasmin, G., *Methods and Achievements in Experimental Pathology. 2. Investigative Techniques*, pp. 257-284. Basel and New York: S Karger, 1967.

E7,223/67

In rats, ARH is associated with increased secretion of 18-OH-DOC and disturbances in NADPH generation. EM studies indicate gross mitochondrial anomalies during the early regenerative process. "Some association might therefore exist between this morphologic abnormality and the accumulation of abnormal quantities of DOC and 18-hydroxy-DOC" (89 refs.).

Skelton, F. R., Brownie, A. C.: "Studies on the pathogenesis of adrenal-regeneration and methylandrostanediol hypertension." In: Jasmin, G., *Endocrine Aspects of Disease Processes*, pp. 271-299. St. Louis, Mo.: Warren H Green, 1968.

E7,627/68

Detailed comparative review on the hypertensive vascular disease developing during adrenal regeneration following partial adrenalectomy or treatment with MAD in a rat sensitized by uninephrectomy and 1 percent sodium chloride. Special emphasis is laid upon EM and biochemical changes in the adrenal cortex, which suggest an interference with the 11 β -hydroxylation of DOC (60 refs.).

Selye, H.: *Experimental Cardiovascular Diseases*, 2 vols., p. 1155. New York, Heidelberg, Berlin: Springer-Verlag, 1970.

G60,083/70

Extensive monograph surveying virtually the entire literature on experimental cardiovascular diseases produced by stressors, mineralocorticoids, MAD, ARH, and the ESCN.

Hall, C. E., Hall, O.: "Adrenal regeneration hypertension." In: Onesti, G., Kim, K. E. et al., *Hypertension. Mechanisms and Management*, pp. 549-562. New York: Grune & Stratton, 1973. J11,591/73

A review of the present status of ARH leads to the yet unproven supposition that a modification in blood supply and other changes "so alter the availability of substrates, enzymes, co-factors, and the like, that the gland is unable to synthesize corticosterone and aldosterone optimally, with the result that a precursor of both, 11-deoxycorticosterone, is produced in excess, and in a continuous rather than rhythmic fashion" (77 refs.).

Gaunt, R., Melby, J. C., Dale, S. L., Grekin, R. J., Brown, R. D.: "Adrenal regeneration hypertension." Proc. 4th Int. Congr. Endocrinology, Washington, D. C., 1972. *Int. Congr. Ser. No. 273*, pp. 740-745 (1974).

J15,089/74

Brief but informative and up-to-date review on the hormonal changes during ARH in the rat.

Hall, C. E., Ayachi, S., Hall, O.: "Hypertensive vascular disease produced in rats by compression of the adrenal and its relationship to adrenal-regeneration hypertension." *Endocrinology* **94**: 355-362 (1974).

H86,268/74

In rats sensitized by uninephrectomy and sodium chloride, adrenal compression produces hypertensive vascular disease similar to that elicited by ARH. Technically, this new procedure is simpler.

Hall, C. E., Ayachi, S., Hall, O.: "Adrenal compression: effect of varied intensity on the resultant hypertensive response in rats." *Tex. Rep. Biol. Med.* **32**: 479-488 (1974).

J17,208/74

In uninephrectomized, sodium chloride-treated rats, even gentle compression of one adrenal (without extirpation or compression of the other) sufficed to produce hypertension and vascular disease. "The advantages of light compression over severe compression (or adrenal enucleation) include the greater simplicity of the procedure, prevention of adrenal atrophy, and better preservation of the medulla and of a relatively normal adrenocortical architecture." It remains to be seen whether here, as in ARH, increased secretion of mineralocorticoids is of pathogenic importance.

NEUROPSYCHIATRIC DISEASES

[See also Audiogenic Seizures, Gastrointestinal, Cardiovascular, and other potentially psychosomatic diseases]

Generalities

A large number of reviews and monographs in various languages attempt to summarize the psychosomatic and psychiatric consequences of maladjustment to stress. Special emphasis has been placed on the predisposing factors that determine why certain individuals respond with mental, others with somatic, manifestations when they are unable to adjust themselves to life situations. Although interpretations differ in detail, most investigators agree that derailments of the G.A.S. may be both the cause and the consequence of exposure to neurogenic stressors.

Because of many overlaps, it is notoriously difficult to classify mental diseases into sharply delimited categories, but to make the enormous literature on the subject as accessible as possible, we have arbitrarily subdivided pertinent data under the following headings:

- Psychosomatic Diseases
- Neuroses
- Schizophrenia and Related Psychoses
 - Generalities
 - Hormonal Changes
 - Nonhormonal Metabolic Changes
- Manic-depressive Disease (including mixed syndromes and those in which either manic excitement or depression predominate)
- Toxicomanias (including Alcoholism)
- Senile Psychosis
- Other Neuropsychiatric and Psychosomatic Diseases
- Experimental Neuroses (including Toxicomanias)

Generalities

Benda, P.: "Le syndrome général d'adaptation. Ses applications cliniques et thérapeutiques en neuro-psychiatrie" (The general adaptation syndrome. Clinical and therapeutic applications in neuropsychiatry). *Encéphale* **40**: 228-284 (1951). B71,777/51

Extensive review of the G.A.S. with special reference to its application in psychiatry (104 refs.).

Malmo, R. B., Shagass, C., Davis, J. F.: "Electromyographic studies of muscular tension in psychiatric patients under stress." *J. Clin. Exp. Psychopathol.* **12**: 45-66 (1951). C90,082/51

Psychoneurotic and psychotic patients responded to various stressors (pain, discrimination, mirror drawing) with greater muscular tension (EMG) than did normal controls.

Loo, P., Breton, J.: "Idées de Selye et clinique psychiatrique" (Selye's ideas and psychiatric clinic). *Ann. Méd. Psychol.* **2**: 108-112 (1952). J25,471/52

Russell, R. W.: "Behaviour under stress." *Int. J. Psychoanal.* **34** Supp.: 1-12 (1953). D87,619/53

A lecture before the British Psycho-Analytical Society summarizing the G.A.S., with special emphasis upon behavioral changes induced by stress.

Cohn, J. B., Rubinstein, J.: "An experimental approach to psychological stress." *Am. J. Psychiatry* **111**: 276-282 (1954). D95,167/54

An attempt to furnish a basis for the interpretation of psychiatric illness in relation to the G.A.S.

Selye, H.: "Stress and psychiatry." *Am. J. Psychiatry* **113**: 423-427 (1956). C12,621/56

Whitehorn, J. C.: "Stress and emotional health." *Am. J. Psychiatry* **112**: 773-781 (1956). E68,251/56

Morozov, V. M.: "The stress concept and psychiatry." *Zh. Nevropatol. Psichiatr.* **57**: 657-661 (1957) (Russian). D2,827/57

Brief résumé on the role of stress in the pathogenesis of psychiatric illness.

Tanner, J. M. (ed.): *Stress and Psychiatric Disorder*, p. 151. Oxford: Basil Black-

well & Mott, 1960. C90,490/60

Second Oxford Conference of the Mental Health Research Fund, with contributions from many specialists on the psychologic and somatic aspects of the stress concept. The main subjects are: disorganization of behavior during stress in man and animals, physiologic responses to stressors, and prevention and treatment of psychiatric stress reactions.

Vickers, G.: "The concept of stress in relation to the disorganization of human behaviour." In: Tanner, J. M., *Stress and Psychiatric Disorder*, pp. 3-10. Oxford: Blackwell Scientific, 1960. C90,491/60

Tong, J. E., Murphy, I. C.: "A review of stress reactivity research in relation to psychopathology and psychopathic behaviour disorders." *J. Ment. Sci.* **106**: 1273-1295 (1960) (212 refs.). J10,963/60

Rogovin, M.: "Mental stress and mental disorders (from foreign literature)." *Zh. Nevropatol. Psichiatr.* **62**: 1731-1740 (1962) (Russian). J24,043/62

Langner, T. S., Michael, S. T.: *The Mid-Town Manhattan Study. Life Stress and Mental Health*, p. 517. London: The Free Press of Glencoe, Collier-MacMillan, 1963. E3,442/63

Extensive monograph on the role of psychogenic stress in the production of various mental disorders in the Manhattan area.

Michael, R. P., Gibbons, J. L.: "Interrelationships between the endocrine system and neuropsychiatry." *Int. Rev. Neurobiol.* **5**: 243-302 (1963). J10,431/63

Review on the participation of the endocrine system in normal and pathologic nervous activity, with a special section on stress and the adrenal cortex.

Cassidy, W. J.: "Psychiatric emergencies." *Henry Ford Hosp. Med. J.* **15**: 119-131 (1967). G49,025/67

Theoretical considerations lead to the assumption that a number of psychiatric emergencies (excitement, delirium, panic states, hysterical outbreaks, suicides) are consequences of exposure to stress.

Rahe, R. H., McKean, J. D. Jr., Arthur, R. J.: "A longitudinal study of life-change and illness patterns." *J. Psychosom. Res.* **10**: 355-366 (1967). D88,215/67

A close relationship was found between stress (as revealed by the LCU question-

naire) and the frequency of disease, especially psychiatric illness, among U.S. Navy personnel.

Beisser, A. R., Glasser, N.: "The precipitating stress leading to psychiatric hospitalization." *Compr. Psychiatry* **9**: 50-61 (1968). J22,596/68

Hudgens, R. W., Robins, E., Delong, W. B.: "The reporting of recent stress in the lives of psychiatric patients. A study of 80 hospitalized patients and 103 informants reporting the presence or absence of specified types of stress." *Br. J. Psychiatry* **117**: 635-643 (1970). G80,310/70

On the basis of statistical data, the authors "conclude that retrospective studies which purport to demonstrate a cause-effect relationship between stressful events and established non-organic psychiatric illness may be of dubious validity."

Cattell, R. B.: "Measurement of neuroticism and anxiety." In: Sahakian, W. S., *Psychopathology Today: Experimentation, Theory and Research*, pp. 173-181. Itasca, Ill.: F E Peacock, 1970. E10,330/70

The author examines the relationship between stress and psychologic changes as its cause or result. Anxiety appears when an individual evades reality and suffers internal conflicts, whereas "effort stress" occurs when he forcefully grapples with reality.

Kiev, A.: "Crisis intervention in industry." *J. Occup. Med.* **12**: 158-163 (1970). J11,373/70

A lecture reviewing the roles of social and psychologic stressors in precipitating psychiatric illness in predisposed persons.

Jaco, E. G.: "Mental illness in response to stress." In: Levine, S. and Scotch, N. A.: *Social Stress*, pp. 210-227. Chicago: Aldine, 1970. E10,715/70

Hocking, F. H.: "Stress and psychiatry." *Med. J. Aust.* **2**: 837-840 (1971). G87,773/71

Brief but stimulating lecture on stress as a factor in psychiatric illness.

Eisler, R. M., Polak, P. R.: "Social stress and psychiatric disorder." *J. Nerv. Ment. Dis.* **153**: 227-233 (1971). G87,329/71

In patients, various "situational or social stressors" can precipitate psychologic disorders, but the subject's predisposition will

determine whether the resulting derangement will be of a schizophrenic, depressive or other type.

Niederland, W. G.: "Introductory notes on the concept, definition, and range of psychic trauma." *Int. Psychiatr. Clin.* **8**: 1-9 (1971). J20,178/71

Berkman, P. L.: "Life stress and psychological well-being: a replication of Langner's analysis in the Midtown Manhattan study." *J. Health Soc. Behav.* **12**: 35-45 (1971). J20,538/71

As indicated by replies to an eight-item Index of Psychological Well-Being in Alameda County, California, a close association exists between stress factors in daily life and mental health, as rated by psychiatrists.

Brown, G. W., Birley, J. L.: "The reporting of recent stress in the lives of psychiatric patients." *Br. J. Psychiatry* **118**: 378-379 (1971). J20,737/71

Clinical experience shows that "external circumstances, such as an occurrence which may make adaptive demands upon the person, may also contribute to the development of mental disorder."

Smith, W. G.: "Critical life-events and prevention strategies in mental health." *Arch. Gen. Psychiatry* **25**: 103-109 (1971). J20,738/71

Myers, J. K., Lindenthal, J. J., Pepper, M. P.: "Life events and psychiatric impairment." *J. Nerv. Ment. Dis.* **152**: 149-157 (1971). J20,743/71

Myers, J. K., Lindenthal, J. J., Pepper, M. P., Ostrander, D. R.: "Life events and mental status: a longitudinal study." *J. Health. Soc. Behav.* **13**: 398-406 (1972). J19,658/72

Using a special questionnaire to appraise psychiatric derangements (insomnia, irritability, tension, and so on), the authors "found a substantial and positive relationship between changes in life events and changes in psychological impairment over a two-year period."

Aponte, J. F., Miller, F. T.: "Stress-related social events and psychological impairment." *J. Clin. Psychol.* **28**: 455-458 (1972). J19,676/72

Levi, L., Kagan, A.: "A synopsis of ecology and psychiatry: some theoretical psychosomatic considerations, review of some studies and discussion of preventive aspects."

Proc. 5th World Congr. of Psychiatry, Mexico, D. F., 1971, *Int. Congr. Ser. No. 274*, pp. 369-379 (1973). J16,708/73

Bugard, P.: *Stress, Fatigue et Dépression. (l'Homme et les Agressions de la Vie Quotidienne)* (Stress, fatigue, and depression. Man and the aggression of daily life), Vol. 1, p. 294, Vol. 2, p. 302. Paris: Doin Edit., 1974. E10,487/74

Two-volume treatise on stress problems in daily life with a special chapter on fatigue and depression in relation to stress.

Adler, G.: "Acute psychosis." *N. Engl. J. Med.* **291**: 81-83 (1974). H87,634/74

Review of various acute psychotic episodes elicited by stressors in relatively healthy persons.

Paykel, E. S.: "Life stress and psychiatric disorder: applications of the clinical approach." In: Dohrenwend, B. S. and Dohrenwend, B. P., *Stressful Life Events: Their Nature and Effects*, pp. 135-149. New York,

London and Sydney: John Wiley & Sons, 1974. E10,786/74

Myers, J. K., Lindenthal, J. J., Pepper, M. P.: "Social class, life events, and psychiatric symptoms: a longitudinal study." In: Dohrenwend, B. S. and Dohrenwend, B. P., *Stressful Life Events: Their Nature and Effects*, pp. 191-205. New York, London and Sydney: John Wiley & Sons, 1974.

E10,790/74

Cohler, B. J., Grunbaum, H. U., Weiss, J. L., Gallant, D. H., Abernethy, V.: "Social relations, stress, and psychiatric hospitalization among mothers of young children." *Soc. Psychiatry* **9**: 7-12 (1974). J15,145/74

Hospitalization for psychiatric disturbances of mothers of young children is associated with psychogenic stress; it "is believed to be related both to impairment in a woman's performance of her role as housewife and mother, as well as to life stress experienced prior to hospitalization."

Psychosomatic Diseases

(See also Neuroses)

There can be no doubt that many psychosomatic derangements are due to stress and particularly to derailments of the G.A.S. A large number of maladies depend not so much upon the apparent pathogen, but upon the way we react to it. This idea was clearly expressed in the eighteenth century by C. H. Parry when he wrote: "It is much more important to know what sort of a patient has a disease, than what sort of a disease a patient has." Several statistical studies show that "clusters of illness" often occur during periods that are significantly stressful for people striving to adapt to conflicting and often threatening demands. Numerous books attempt to provide advice—both in medical and lay language—on how to deal with such situations.

It appears that many of the psychosomatic derangements can be predicted by questionnaires (for example, the SRE of Rahe and his coworkers). Among the most common somatic diseases frequently traced to a psychogenic stress situation are: allergies, asthma, skin disorders, gastrointestinal maladies, and derangements of the cardiovascular system (particularly hypertension and CHD). Even immune reactions can be influenced by psychogenic stress and in latent diabetics, ketoacidosis is occasionally precipitated by emotional stress.

The derangements in the CNS that can result from psychogenic stress are usually classified under neuroses and will be dealt with in more detail in the next section, but it might be mentioned here that in this category the most common complaints are migraine headaches, chronic fatigue and bruxism.

Many investigators have attempted to elucidate the mechanism of psychosomatic derangements, and if possible, cure them by psychoanalytic techniques.

Psychosomatic Diseases

(See also our earlier stress monographs, p. xiii)

Dunbar, F.: *Emotions and Bodily Changes*, p. 604. New York: Columbia University Press, 1947. B36,276/47

Survey of the literature produced between 1910 and 1945 on psychosomatic interrelations (2,400 refs.).

Weiss, E., English, O. S.: *Psychosomatic Medicine*, p. 803. Philadelphia and London: W B Saunders, 1949. B48,177/49

Extensive, though now somewhat outdated, textbook of psychosomatic medicine with a rich collection of historically interesting references.

Wolff, H. G., Wolf, S. G. Jr., Hare, C. C. (eds.): *Life Stress and Bodily Disease*, p. 1135. Baltimore: Williams & Wilkins, 1950. B51,891/50

Proceedings of the Association for Research in Nervous and Mental Diseases with papers on: mechanisms involved in reactions to stress; the problem of specificity; life stress; headaches; disorders of growth, development and metabolism; diseases of the eye, respiratory passages, gastrointestinal tract, locomotor apparatus, cardiovascular system, skin and genital organs.

Alexander, F.: *Psychosomatic Medicine*, p. 300. New York: W W Norton, 1950. B52,789/50

Simple textbook on psychosomatic medicine in relation to psychoanalysis and the G.A.S. (260 refs.).

Laborit, H.: *Réaction Organique à l'Aggression et Choc* (Organic reactions to stress and shock) (Preface by R. Leriche), p. 205. Paris: Masson, 1952. B71,290/52

General review on the relationship between the concepts of homeostatic mechanisms of Claude Bernard, Walter Cannon and J. Reilly. Detailed description of functional and structural changes in the nervous, hormonal and reticuloendothelial systems.

Harper, R.: "Allergy, and other stress-conditioned illness: a suggested association with obsolete autonomic defence reflexes." *Br. Med. J.* February 14, 1953, pp. 392-395. E98,761/53

Review on the role of stress in the precipitation of psychic disturbances, allergies and particularly asthma.

Altschule, M. D.: *Bodily Physiology in Mental and Emotional Disorders*, p. 288. New York: Grune & Stratton, 1953.

B79,943/53

Monograph on the somatic repercussions of mental disorders with a very brief section on stress and the hypothalamus-pituitary-adrenocortical system.

Margetts, E. L.: "Historical notes on psychosomatic medicine." In: Wittkower, E. D. and Cleghorn, R. A., *Recent Developments in Psychosomatic Medicine*, pp. 41-68. London: I Pitman & Sons, 1954. E89,578/54

A motto of C. H. Parry (1755-1822) was: "It is much more important to know what sort of a patient has a disease, than what sort of a disease a patient has." The history of ideas about correlations between man, body and cell is traced back to antiquity and followed through up to the publication of the first detailed monograph on stress (Selye, 1950).

Wolff, H. G.: "Stress, emotions and bodily disease." In: Galdston, I., *Medicine and Science. Lectures to the Laity*, No. XVI, p. 94. New York: International University Press, 1954. B94,724/54

Review on the role of stressors in the development of cutaneous, gastrointestinal, respiratory and mental disturbances.

Wolff, H. G.: "Stress and adaptive patterns resulting in tissue damage in man." *Med. Clin. N. Am.* May 1955, pp. 783-797. B28,531/55

Primarily psychologic analysis of psychosomatic diseases affecting various organs (16 refs.).

Lewinsohn, P. M.: "Some individual differences in physiological reactivity to stress." *J. Comp. Physiol. Psychol.* 49: 271-277 (1956). C39,686/56

Technical paper on physiologic reactivity to stress in patients with duodenal ulcer, essential hypertension or neuromuscular tension. Modified Cold Pressor Test and Failure Test were used.

Funkenstein, D. H., King, S. H., Drolette, M. E.: *Mastery of Stress*, p. 329. Cambridge, Mass.: Harvard University Press, 1957. C49,747/57

Observations on stress-producing situations and their prevention in man and experimental animals. Main emphasis is laid upon psychologic factors, but the somatic aspects of the G.A.S. are also considered.

Hinkle, L. E., Jr., Wolff, H. G.: "The nature of man's adaptation to his total environment and the relation of this to illness." *Arch. Intern. Med.* **99**: 442-460. (1957).

C32,709/57

Extensive statistical studies led to the conclusion that "clusters of illness often occurred during periods significantly stressful for the person, when he was striving to adapt to what were for him highly pertinent, conflicting, and often seriously threatening demands arising out of his relation to his total environmental constellation, as he perceived it."

Selye, H.: "Panorama general de la etiopatogenia de las enfermedades de adaptación" (A general view of the etiopathogenesis of the diseases of adaptation). *Acta Med. Psicol.* **1**: 11-20 (1958).

C52,444/58

Review lecture given to the second Psychological Congress of Latin America on the G.A.S. as a basis for the study of psychosomatic diseases of adaptation.

Reed, C. F., Alexander, I. E., Tomkins, S. S. (eds.): *Psychopathology. A Source Book*, p. 803. Cambridge, Mass.: Harvard University Press, 1958.

C57,851/58

An extensive anthology on various psychosomatic derangements, with several sections devoted to stress-induced diseases.

Schindler, J. A.: *How to Live 365 Days a Year*, p. 222. Englewood Cliffs, N.J.: Prentice-Hall, 1959.

C69,069/59

Recommendations on how to avoid psychosomatic illness, based primarily on the stress concept. Written exclusively for the lay reader.

Hambling, J. (ed.): *The Nature of Stress Disorder*, p. 298. Springfield, Ill.: Charles C Thomas, 1959.

E4,674/59

Proceedings of the Conference of the Society for Psychosomatic Research (Royal College of Physicians, London). Several experts discussed the G.A.S. on the basis of animal experiments and observations in man. Special sections deal with stress in aviation, skin disorders, gastrointestinal disease, industry, and the family setting, as well as genetic predisposition.

Rees, L.: "The role of stress in the aetiology of psychosomatic disorders." *Proc. R. Soc. Med.* **52**: 274-278 (1959).

C80,538/59

Review of psychosomatic diseases related to the G.A.S.

Selye, H.: "Some implications of the stress concept." In: Coleman, J. C., *Personality Dynamics and Effective Behavior*, pp. 486-492. Chicago: Scott, Foresman, 1960.

E24,124/60

Brief résumé on the stress factor in psychosomatic diseases, written in a semipopular style.

Wolff, H. G.: "Stressors as a cause of disease in man." In: Tanner, J. M., *Stress and Psychiatric Disorder*, pp. 17-31. Oxford: Blackwell Scientific, 1960.

C90,493/60

Kollar, E. J.: "Psychological stress: a re-evaluation." *J. Nerv. Ment. Dis.* **132**: 382-396 (1961).

D7,763/61

On the basis of the literature and personal observations, "the concept of stress has been extended to include inhibitory-conservative shifts as well as excitatory shifts in homeostasis. These shifts may be either adaptive or maladaptive. If the response is prolonged in duration or inappropriate to the stress, pathophysiological and tissue changes may result."

Menninger, K., Mayman, M., Pruyser, P.: *The Vital Balance, The Life Process in Mental Health and Illness*, p. 531. New York: Viking Press, 1963.

E6,393/63

Well-documented treatise with an extensive bibliography on psychosomatic medicine. Special emphasis is placed upon coping devices in everyday life, aggression, neurotic behavior, and the importance of a personal relationship between physician and patient.

Wolf, S.: "Life stress and patterns of disease." In: Lief, H. I., Lief, V. F. et al., *The Psychological Basis of Medical Practice*, pp. 109-114. New York, Evanston, Ill., and London: Hoeber Medical, 1963.

J8,207/63

Brief chapter on the pathogenesis of psychosomatic diseases, with special reference to the role of stress.

Graham, D. T., Stevenson, I.: "Disease as response to life stress. I. The nature of the evidence." In: Lief, H. I., Lief, V. F. et al., *The Psychological Basis of Medical Practice*, pp. 115-136. New York, Evanston, Ill., and London: Hoeber Medical, 1963.

J8,246/63

A review of the literature and personal observations led to the conclusion "that there is a considerable body of evidence that social stresses are etiologically important in many diseases."

Graham, D. T., Stevenson, I.: "Disease

as response to life stress. II. Obtaining the evidence clinically." In: Lief, H. I., Lief, V. F. et al., *The Psychological Basis of Medical Practice*, pp. 137-153. New York, Evans-ton, Ill., and London: Hoeber Medical, 1963.

J4,528/63

Brief chapter on the role of stress in psychosomatic disease.

Brady, J. V.: "Behavioral stress and physiological change: a comparative approach to the experimental analysis of some psychosomatic problems." *Trans. N.Y. Acad. Sci.* **26**: 483-496 (1964). F9,450/64

Müller, K. E.: *Einführung in die Allgemeine Psychologie* (Introduction to general psychology), p. 257. Stuttgart: Ferdinand Enke Verlag, 1965. E4,995/65

Textbook on psychology with a penetrating analysis of psychosomatic interrelations, especially with regard to the stress syndrome.

Corson, S. A.: "Neuroendocrine and behavioral response patterns to psychologic stress and the problem of the target tissue in cerebrovisceral pathology." *Ann. N.Y. Acad. Sci.* **125**: 890-918 (1966). G36,865/66

Review of the technical literature on the conditioning factors determining which particular target tissue will respond to physiologic or psychologic stressors.

Sternbach, R. A.: "Psychophysiological bases of psychosomatic phenomena." *Psychosomatics* **7**: 81-84 (1966). F65,665/66

Appley, M. H., Trumbull, R. (eds.): *Psychological Stress. Issues in Research*, p. 471. New York: Appleton-Century-Crofts, 1967. E10,048/67

Conference on psychologic stress attended by numerous specialists who presented papers on the technical aspects of the G.A.S. in relation to psychosomatic medicine.

Lacey, J. I.: "Somatic response patterning and stress: some revisions of activation theory." In: Appley, M. H. and Trumbull, R., *Psychological Stress. Issues in Research*, pp. 14-42. New York: Appleton-Century-Crofts, 1967. E10,408/67

Theoretical considerations on the interpretation of psychosomatic derangements.

De l'Émotion à la Lésion. Physiologie et Pathophysiologie des Corrélations Psychophysiques: Aspects Thérapeutiques (From emotion to lesion. Physiology and pathophysiology of psychophysiological correlations: therapeutic aspects), p. 165. Montreal: Hoffman-La Roche, 1968. E10,047/68

Extensive semipopular description of psychosomatic reactions, with a detailed discussion of the G.A.S.

Hubin, P.: "Fondements expérimentaux de la médecine psychosomatique. X. Hématologie" (Experimental basis of psychosomatic medicine. X. Hematology). *Rev. Méd. Liège* **23**: 706-711 (1968). J21,399/68

Wolf, S., Goodell, H. (eds.): *Harold G. Wolff's Stress and Disease*, p. 277. Springfield, Ill.: Charles C Thomas, 1968.

E120/68

A revised and updated edition of Harold G. Wolff's *Stress and Disease*. Emphasis is placed on protective adaptive reactions which can play a decisive role in man's resistance to the common stressors of modern life. Special sections are devoted to "stress interviews" and to the part played by stress in headache and migraine and in respiratory, cardiovascular and digestive diseases in relation to social adjustment and a healthy philosophy of life.

Shanon, J.: "Stress and conflict as criteria for the classification of psychosomatic skin disorders." *Arch. Belg. Dermatol. Syphiligr.* **25**: 429-437 (1969). J2,894/69

Psychosomatic skin disorders are common among survivors of Nazi concentration camps. Stress and conflict are of pathogenic importance in such cases.

Christian, P.: "Berufsunfähigkeit aus psychosomatischer und psychoneurotischer Ursache in der Lebensmitte und der zweiten Lebenshälfte" (Occupational disability from psychosomatic and psychoneurotic causes in the middle and in the second half of life). *Z. Psychosom. Med. Psychoanal.* **15**: 282-287 (1969). J9,207/69

Cassel, J.: "Physical illness in response to stress." In: Levine, S. and Scotch, N. A., *Social Stress*, pp. 189-209. Chicago: Aldine, 1970. J12,699/70

Brief outline of the role of stress in psychosomatic medicine and psychopharmacology.

Sahakian, W. S.: "Psychosomatic and stress disorders." In: Sahakian, W. S., *Psy-*

chopathology Today: Experimentation, Theory and Research, pp. 191-196. Itasca, Ill.: F E Peacock, 1970. E10,331/70

The role of the G.A.S. in psychosomatic disease is reviewed.

Silverman, S.: *Psychologic Cues in Forecasting Physical Illness*, p. 403. New York: Appleton-Century-Crofts, 1970.

E10,672/70

Monograph on psychosomatic diseases, particularly stress-induced derangements, based largely on psychoanalytic investigations. The more of the following characteristics that appear together in a person, the greater the probability of the occurrence of somatic disease: "(1) exposure to critical psychologic stress inadequately compensated for by other environmental factors of a favorable nature; (2) some degree of physical dysfunction (ranging up to major illness) as part of a general style of adaptation to psychologic stress in the past, with previously sensitized body areas representing potential current target organs; (3) evidence of increasing instability and regressive shifts in psychologic equilibrium; (4) blocking of affects from adequate emotional expression or insufficient awareness of their significance if they are being so discharged; (5) presence of denial as a prominent psychologic defense; (6) existence of a high degree of ego-superego tensions despite lessening psychologic manifestations of their presence; (7) build-up of unmodified aggressiveness which is internalized; (8) a persisting increase in awareness of physical sensations and perceptions compared with previous levels; (9) recurrent dreams (and parapraxia) whose latent content contains prominent physical references especially to some form of dysfunction; (10) verbal references to somatic identification with an emotionally significant object, reinforced by actual occurrence of similar or related organ dysfunction in that person."

Kagan, A.: "Epidemiology and society, stress and disease." In: Levi, L., *Society, Stress and Disease. 1. The Psychosocial Environment and Psychosomatic Diseases*, pp. 36-48. London, New York and Toronto: Oxford University Press, 1971. E9,303/71

Neuroses

There is a great tendency to explain neurotic behavior on the basis of maladjustment to the stress of life. However, unequivocal objective evidence of deranged ACTH or corticoid secretion has not been consistently observed in psychoneurotic subjects.

Anxiety, autism (especially in children), various types of war neuroses, stuttering, motor disturbances, head or backaches and anorexia nervosa are often regarded as typical neurotic traits that can be traced to stress, but—as previously mentioned—it is virtually impossible to classify these diseases with precision, and almost any psychosomatic derangement may be looked upon as neurotic.

H87,829/74

Review on *headache* as a consequence of dysfunction in the masticatory system, particularly malocclusion. *Bruxism* is frequently the manifestation of psychogenic stress (26 refs.).

Mecklenburg, R. S., Loriaux, D. L., Thompson, R. H., Andersen, A. E., Lipsett, M. B.: "Hypothalamic dysfunction in patients with *anorexia nervosa*." *Medicine* (Baltimore) **53**: 147-159 (1974).

J12,039/74

Clinical "observations suggest that psychic stress may have an adverse effect on the hypothalamus." In many cases, hypothalamic dysfunction appears to be an important factor in *anorexia nervosa* (98 refs.).

Tinbergen, N.: "Ethology and stress diseases." *Science* **185**: 20-27 (1974).

H87,100/74

Autism appears to be due predominantly to environmental factors, mainly behavior towards a child. The parents of autistic children are often under stress and "at least a large proportion of autists are victims of some kind of environmental stress, whose basic trouble is of an emotional nature." Hence, treatment should be based primarily upon restoration of emotional security. In this Nobel lecture the author points out that more than half a century ago and without any medical training, F. M. Alexander developed a technique for correcting various somatic and mental disorders by improvement of body posture and avoidance of faulty use of our neuromuscular system. "Misuse, with all its psychosomatic, or rather somatopsy-

chic, consequences must therefore be considered a result of modern living conditions of a culturally determined stress." There is considerable evidence that arthritis, respiratory troubles, asthma, hypertension, gastrointestinal disorders, various gynecologic derangements, sexual failures, migraine and depression (all diseases not caused by identifiable pathogens), as well as suicide, are often actually due to stress. These diseases can be corrected by proper ethologic counselling. "It is stress in the widest sense, the inadequacy of our adjustability, that will become perhaps the most important disruptive influence in our society."

"Factors that deplete noradrenaline stores from nerve-endings (reserpine, tyramine, phenylethylamine, and stress) may elicit *migrainous attacks* in sensitive subjects, and in severe headache crisis, catecholamine depletion may be a secondary component of stress."

Schizophrenia and Related Psychoses

Generalities. Several studies indicate that stressful life situations can precipitate schizophrenia in genetically predisposed individuals. It has also been stated that the prognosis is better in subjects with a history of stress shortly before the onset of the illness. It is not clear why stress can precipitate either schizophrenia or manic-depressive states in predisposed individuals, but presumably this depends upon differences in endogenous and exogenous conditioning factors.

Schizophrenic patients appear to exhibit heightened activity during rest, but are less subject than normals to arousal by interpersonal stress situations. This has been ascribed to the fact that schizophrenics are less responsive to stressors because they are already under continuous stress as a consequence of their disease. Some investigators speak of a "hierarchy of stressors" and believe that schizophrenics tend to experience life-threatening stressors constantly and hence practically disregard current events.

→**Hormonal Changes.** The earliest investigations of a possible relationship between schizophrenia and the G.A.S. led to the conclusion that unlike normal subjects, schizophrenics fail to react to various stressors with the usual lymphocytopenia and increase in corticoid output, sometimes exhibiting even inverse responses. They also fail to show the normal circadian variations in adrenocortical activity. Some schizophrenics are allegedly resistant even to adrenal stimulation by ACTH injections. Since these patients are regarded as having been "broken as a result of the stresses of daily life, this basic failure of a fundamental stress-response mechanism is especially interesting." Subsequent investigations confirmed that psychotics do not react to stressful psychologic disturbances with the usual lymphocytopenia (or even hyperglycemia), but they are capable of normal responses to such stressors as EP, insulin or electroshock. However, other investigators maintained that schizophrenics are unable to respond even to physical stressors (EP, insulin) with the usual hematologic and biochemical reaction pattern and hence concluded that they suffer from a disturbance of the pituitary-adrenocortical mechanism itself.

The existence of such an inherent deficiency has not been uniformly confirmed; in

any event, it has been questioned whether the postulated adrenocortical deficiency is a primary trait rather than the consequence of metabolic disturbances induced by the psychosis.

In surveying the innumerable publications on this subject, it is difficult to draw any meaningful conclusions because most authors failed to differentiate between acute and chronic schizophrenia or even more or less closely related, yet manifestly different, psychiatric derangements. Furthermore, the techniques used for the determination of hormones were quite dissimilar and often not clearly specified. However, in surveying the pertinent data, the impression is gained that there is often some disturbance of adrenocortical function in schizophrenics, although this is rarely very prominent and is far too inconstant to be regarded as an essential link in the pathogenesis of the disease.

More recently, considerable attention was given to the fact that in psychotics the corticoid feedback mechanism appears to be defective, since dexamethasone only partially depresses their plasma cortisol levels. According to another study, dexamethasone eliminates significant circadian variations of the plasma corticoid but not of the FFA levels in schizophrenic and depressive patients. However, when administered for several weeks, it does lower cortisol, corticosterone and FFA concentrations.

Some investigators maintain that thyroid function is also disturbed in schizophrenics, but the evidence for this is still scanty.

→**Nonhormonal Metabolic Changes.** Several researchers have claimed that the plasma FFA and glucose concentrations in schizophrenics, though normal under resting conditions, fail to respond to insulin and other stressors as they do in controls.

Earlier claims of a derangement in hippuric acid excretion in catatonic schizophrenics apparently have never been verified.

Schizophrenia and Related Psychoses

"All actively psychotic as well as remitted patients showed distinct, discrete varieties of disorganized, unintegrated autonomic responses to stress and during homeostatic recovery."

Jacobs, S.: "Stress and the schizophrenias." *Brit. Med. J.* June 17, 1972, p. 712.

J20,193/72

Under certain conditions, there exists an inverse ratio between severe stress and the favorable outcome of schizophrenias. This may be due to the fact that, generally speaking, the more 'reactive' the mental illness, the better its prognosis.

Payk, T. R.: "Beitrag zur Frage der Auslösung einer akuten Schizophrenie durch psychische Erschütterungen" (Induction of acute schizophrenia by psychic shock). *Schweiz. Arch. Neurol. Neurochir. Psychiatr.* **111**: 131-141 (1972) (52 refs.).

E10,689/74

Discussion on the use of the SRE questionnaire in predicting the development of schizophrenia or depression (25 refs.).

Dewolfe, A. S., Youkilis, H. D.: "Stress and the word associations of process and reactive schizophrenics." *J. Clin. Psychol.* **30**: 151-153 (1974). J12,011/74

Snyder, S. H.: *Madness and the Brain*, p. 295. New York, St. Louis and San Francisco: McGraw-Hill, 1974. E10,648/74

Monograph on the mechanisms of mental illness, with special reference to schizophrenia. The so-called "acute schizophrenics" often appear fairly well adjusted until they suddenly deteriorate as a result of some stressful life event. "Acute schizophrenia does not seem to run in families. Perhaps it is some sort of reaction to extreme stress, which could conceivably afflict almost anyone exposed to an overwhelmingly traumatic situation. For example, it is well known that many soldiers, otherwise normal, become psychotic in the battlefield, but recover rapidly when removed from the battlefield and do not become mentally ill thereafter."

Jacobs, S. C., Prusoff, B. A., Paykel, E. S.: "Recent life events in schizophrenia and depression." *Psychol. Med.* **4**: 444-453 (1974). J21,683/74

Serban, G., Woloshin, G. W.: "Relationship between pre- and postmorbid psychological stress in schizophrenics." *Psychol. Rep.* **35**: 507-517 (1974). J20,522/74

Using the SSFIPD as a basis for measurement, a statistical study on several hundred schizophrenics demonstrated that they "encountered more problems in their youth, adolescence and their adult years compared

to the normals. Also, both chronic and acute schizophrenics showed a high degree of continuity between earlier and later types of difficulties."

Serban, G.: "Parental stress in the development of schizophrenic offspring." *Compr. Psychiatry* **16**: 23-36 (1975). J20,419/75

Using the SSFIPD on a large patient population, the author envisions "schizophrenia as a manifestational entity with possible multiple etiologies where one could identify a genetic etiology separately from the environmental one, the interaction between them producing the most stressful form of all."

Serban, G.: "Stress in schizophrenics and normals." *Br. J. Psychiatry* **126**: 397-407 (1975). J20,523/75

Using the SSFIPD in schizophrenics, the author found that "chronics experienced maximum stress, acutes an intermediate amount, while normals evidenced a minimum level of stress in their daily life. The highest stressors for acutes and chronics were interpersonal relationships and social performance.... The classical concept of low stress in chronics and favorable prognosis in the presence of precipitating factors were not supported by the present data."

→ACTH and Corticoids. Pincus, G., Elmadjian, F.: "The lymphocyte response to heat stress in normal and psychotic subjects." *J. Clin. Endocrinol.* **6**: 295-300 (1946). B1,243/46

Normal men exposed to temperatures of 40.5 to 44.0°C at 85 to 95 percent relative humidity exhibited marked "stress lymphocytopenia" which was attributed to increased corticoid secretion. "With the short-time stress employed here it is entirely likely that we are dealing with the first stage of the adaptation syndrome which involves adrenocortical hypersecretion as the result of the pituitary stimulation." By contrast, twenty out of twenty-one psychotic (mostly schizophrenic) subjects exhibited a rise in blood lymphocytes after heat exposure.

Hoagland, H., Elmadjian, F., Pincus, G.: "Stressful psychomotor performance and adrenal cortical function as indicated by the lymphocyte response." *J. Clin. Endocrinol.* **6**: 301-311 (1946). B1,244/46

The stress of operating the Hoagland-Werthessen pursuit meter causes marked lymphopenia and an increased 17-KS output

in normal subjects, but only irregular results in schizophrenics.

Pincus, G.: "Studies of the role of the adrenal cortex in the stress of human subjects." *Rec. Prog. Horm. Res.* **1**: 123-145 (1947). 98,426/47

Excellent review on the biochemical changes characteristic of the G.A.S. in man, with special reference to 17-KS excretion and blood counts under the influence of circadian variations, the stresses of daily life, operation of a Hoagland-Werthessen pursuit meter, flying and heat. The response of schizophrenics is abnormal in many respects, and the question is raised whether adrenal malfunction may play a pathogenic role in mental disease (20 refs.).

Hoagland, H.: "The human adrenal cortex in relation to stressful activities." *J. Aviat. Med.* **18**: 450-464 (1947). B4,975/47

Endocrine and metabolic studies revealed profound disturbances of adrenal cortical function in schizophrenic patients exposed to stress. This failure is particularly interesting "since psychotics are persons who have broken under the stresses of daily life and have developed bizarre and socially inadequate behavior patterns to cope with their environment." The author states that "in about half of our psychotic patients, we have found that the adrenal cortex simply does not respond to injections of purified pituitary adrenocorticotrophin."

Hoagland, H.: "Scientific capital and the dividends of applied science." *Dis. Nerv. Syst.* **8**: 3-8 (1947). J7,400/47

Popularized description of deranged adrenocortical hormone production in psychotic and psychoneurotic patients. Although their total twenty-four-hour output of corticoids is essentially normal, the pattern of metabolic excretion is deranged. "Since a characteristic of mental patients is that they have broken as a result of the stresses of life this basic failure of a fundamental stress response mechanism is especially interesting."

Pincus, G., Hoagland, H., Freeman, H., Elmadjian, F.: "Adrenal function in mental disease." *Rec. Prog. Horm. Res.* **4**: 291-322 (1949). B41,235/49

General review on the role of the adrenal in schizophrenia from which it is concluded that in some respects "the schizophrenic subject may be likened somewhat to an organism in the stage of resistance of the adaptation syndrome. He is capable of little or no

further reaction to an alarm. His adrenal cortex is performing to the limit of which it is capable. Our data generally conform to this notion except again for the ability for lymphocyte (and eosinophile) response and the necessity to explain the low neutral reducing lipide output which contrasts with the relatively high 17-ketosteroid excretion."

Parsons, E. H., Gildea, E. F., Ronzoni, E., Hulbert, S. Z.: "Comparative lymphocytic and biochemical responses of patients with schizophrenia and affective disorders to electroshock, insulin shock, and epinephrine." *Am. J. Psychiatry* **105**: 573-580 (1949).

B45,571/49

In psychotic (mainly schizophrenic) patients the blood lymphocyte response to EP, insulin and electroshock is essentially normal. However, the psychotics do not respond to apparently stressful psychologic disturbances with the usual lymphocytopenia and hyperglycemia.

Pincus, G.: "Adrenal cortex function in stress." *Ann. N. Y. Acad. Sci.* **50**: 635-645 (1949).

B37,780/49

General review on changes in adrenocortical function during stress and psychiatric illness. Special emphasis is placed upon blood sugar, lymphocytes, corticoids and 17-KS.

Pincus, G., Hoagland, H., Freeman, H., Elmadjian, F., Romanoff, L. P.: "A study of pituitary-adrenocortical function in normal and psychotic men." *Psychosom. Med.* **11**: 74-101 (1949).

B41,883/49

Extensive review on adrenocortical activity in psychotics with special reference to the G.A.S. These patients respond normally with the classic indicators of corticoid excess when treated with adrenocortical extracts, but the endogenous activation of the adrenal cortex by ACTH is deficient. "Evidence is thus provided of a species of hypoadrenalinism in the psychotic subjects" (44 refs.).

Friedlander, J. H., Perrault, R., Turner, W. J., Gottfried, S. P.: "Adrenocortical response to physiologic stress in schizophrenia." *Psychosom. Med.* **12**: 86-88 (1950).

B65,978/50

In schizophrenic patients the response to stressors (EP, insulin) was rather inconsistent when blood counts, serum ascorbic acid, uric acid excretion, and plasma corticoids were employed as indicators. There appeared to be some derangement in adrenocortical function during schizophrenia, but its nature could not be clearly characterized.

Hoagland, H., Callaway, E., Elmadjian, F., Pincus, G.: "Adrenal cortical responsiveness of psychotic patients in relation to electroshock." *Psychosom. Med.* **12**: 73-77 (1950).

B49,303/50

Pincus, G., Hoagland, H.: "Adrenal cortical responses to stress in normal men and in those with personality disorders. Part I. Some stress responses in normal and psychotic subjects." *Am. J. Psychiatry* **106**: 641-650 (1950).

B51,602/50

Pincus, G., Hoagland, H.: "Part II. Analysis of the pituitary-adrenal mechanism in man." *Am. J. Psychiatry* **106**: 651-659 (1950).

B51,603/50

Normal and schizophrenic men were subjected to psychogenic stressors (target ball frustration test, operation of a pursuit meter), after which the following indices of stress were determined: urinary sodium, potassium, uric acid, 17-KS and neutral reducing lipids (corticoids), as well as circulating lymphocytes and eosinophils. There was "a highly significant failure of normal adrenal stress responses in the schizophrenic population." The adrenal response to ACTH was likewise diminished and could not be corrected by high protein diets or vitamins. By contrast, psychoneurotics responded normally to ACTH. These findings are regarded as important in interpreting the pathogenesis of schizophrenia (35 refs.).

Cleghorn, R. A., Graham, B. F.: "Studies of adrenal cortical activity in psychoneurotic subjects." *Am. J. Psychiatry* **106**: 668-672 (1950).

B56,026/50

In schizophrenic and psychoneurotic patients, adrenocortical activity (as revealed by various indices) appears to be proportional to anxiety and tension.

Faurbye, A., Vestergaard, P., Kobbernagel, F., Nielsen, A.: "Adrenal cortical function in chronic schizophrenia (Stress, adrenaline-test, ACTH-test)." *Acta Endocrinol. (Kbh.)* **8**: 215-246 (1951).

B63,996/51

As indicated by various stress tests (EP or fever vaccine injections), "there is a slight relative adrenal cortex insufficiency in chronic schizophrenia, but it is uncertain whether this insufficiency is an original constitutional trait which facilitates the manifestation of schizophrenia, or whether it arises simultaneously with the disease as the result of a provoking stress, secondary to the psychosis caused by inactivity, or as part of

a complex metabolic disturbance which is the cause of the psychosis or accompanies it."

Stein, M., Ronzoni, E., Gildea, E. F.: "Physiological responses to heat stress and ACTH of normal and schizophrenic subjects." *Am. J. Psychiatry* **108**: 450-455 (1951). B27,764/51

In schizophrenics the blood eosinophils and lymphocytes, as well as the uric acid/creatinine ratios, showed no obvious anomalies, either under basal conditions or after exposure to "heat stress." The reactions to ACTH were also normal.

Pechstein, H.: "Reaction to stress in schizophrenia." *Psychiatr. Q.* **26**: 425-432 (1952). B84,622/52

Schizophrenics show a normal eosinopenia after operative stressors such as lobotomy. "The immediate rise, followed by a sharp drop, in eosinophils, suggestive of a marked output of 11 and 11,17-corticosteroids, is identical to the usual shock and counter-shock phase of the alarm reaction in the adaptation syndrome as described by Selye. Therefore, any alteration possibly present in the schizophrenic's adaptation reaction is not one which would interfere with the immediate response to acute stress situations."

Lehmann, H. E.: "Stress dynamics in psychiatric perspective." *Psychiatry* **15**: 387-393 (1952). B76,849/52

Review on the relationship between the G.A.S. and various psychiatric diseases, with special reference to the role of corticoids.

Altschule, M. D.: *Bodily Physiology in Mental and Emotional Disorders*, p. 288. New York: Grune & Stratton, 1953.

B79,943/53

Monograph on the somatic repercussions of mental disorders, with a very brief section on stress and the hypothalamus-pituitary-adrenocortical system.

Hoagland, H., Pincus, G., Elmadjian, F., Romanoff, L., Freeman, H., Hope, J., Ballan, J., Berkeley, A., Carlo, J.: "Study of adrenocortical physiology in normal and schizophrenic men." *Arch. Neurol. Psychiatry* **69**: 470-485 (1953). B88,375/53

Stevenson, J. A. F., Metcalfe, E. V., Hobbs, G. E.: "Eosinophile response in schizophrenic patients." *Arch. Neurol. Psychiatry* **70**: 802-812 (1953). C3,534/53

gischen Schizophrenieforschung. Bedeutung des Kohlenhydratdefizits" (Somatologic studies in schizophrenia. Importance of carbohydrate deficits). *Arch. Psychiatr. Z. Neurol.* **191**: 114-133 (1953). B90,122/53

Metabolic investigations, particularly on urinary steroids and the eosinopenic response to stressors, lead to the conclusion that "acute schizophrenia in its active phase must be regarded as an expression of disturbed homeostasis, an alarm reaction with its efforts for readaptation in the form of the 'chronic inactive defect schizophrenia' that is a disease of adaptation in Selye's sense."

Hoagland, H.: "Panel discussion of evidences for the nonpsychogenic origins of psychoses. I. Some considerations of the role of the adrenal cortex in the origin of the psychoses." *J. Nerv. Ment. Dis.* **119**: 75-76 (1954). B95,212/54

Patzig, B., Schmitz, W. P.: "Besteht bei schizophrenen Psychosen eine besondere Aktivität im Hypophysen-Nebennierenrinden-System im Sinne eines Dauer-Stress? (Ergebnisse von Uropepsin-Untersuchungen)" (Is there special activity in the pituitary-adrenocortical system of schizophrenics, in the sense of permanent stress? [Results of uropepsin studies]). *Nervenarzt*, **25**: 104-111 (1954). D82,296/54

Freeman, H., Pincus, G., Elmadjian, F., Romanoff, L. P.: "Adrenal responsivity in aged psychotic patients." *Geriatrics* **10**: 72-77 (1955). C4,830/55

Young and old schizophrenics show essentially similar anomalies in their response to ACTH.

Bliss, E. L., Migeon, C. J., Branch, C. H., Samuels, L. T.: "Adrenocortical function in schizophrenia." *Am. J. Psychiatry* **112**: 358-365 (1955). C12,236/55

The adrenocortical and pituitary-adrenocortical reactivity of chronic schizophrenic and normal subjects was equivalent after treatment with ACTH, bacterial pyrogen or insulin (46 refs.).

Hoagland, H., Pincus, G.: "Adrenocortical responsivity to stress and ACTH." *Am. J. Psychiatry* **112**: 748 (1956). D93,394/56

Freeman, S., Steed, W. D., Hoegemeier, H. W., Wheeler, J. X., Savage, L. W., Wadeson, R. W.: "Plasma corticoids in psychiatric illness." *J. Clin. Exp. Psychopathol.* **17**: 263-275 (1956). J11,375/56

In patients with acute mental illness (mostly schizophrenics) the cortisol fraction of plasma corticoids was usually subnormal. "The plasma corticoid response to ACTH infusion was less than that observed in healthy subjects. The plasma corticoid elevation in response to cortisone ingestion was less than normal in 11 of 15 patients tested. The diurnal variation in the concentration of plasma corticoids differed in the patient and control groups. Plasma corticoid data obtained on these patients provide direct evidence of altered adrenocortical function in patients with acute mental illness."

Board, F., Persky, H., Hamburg, D. A.: "Psychological stress and endocrine functions. Blood levels of adrenocortical and thyroid hormones in acutely disturbed patients." *Psychosom. Med.* **18**: 324-333 (1956).

Part I. On the circadian rhythm of the plasma adrenocortical hormone in mental patients and methamphetamine- and chlorpromazine-

treated animals." *Folia Psychiatr. Neurol. Jap.* **23**: 143-158 (1969). G72,651/69

Patients in an acute stage of schizophrenia showed marked disturbances in the circadian rhythm of plasma 17-OHCS. This was not so after recovery, nor in patients with depression, except in very severe cases. Some changes in circadian rhythm were noted occasionally in cases of general paresis and in epileptics.

Sachar, E. J., Kanter, S. S., Buie, D., Engle, R., Mehlman, R.: "Psychoendocrinology of ego disintegration." *Am. J. Psychiatry* **126**: 1067-1078 (1970). J11,480/70

In acute ego disorganization which initiated a schizophrenic episode, "corticosteroid excretion during this phase reached levels 250 percent of subsequent recovery values, far exceeding the elevations seen in normals under stress."

schizophrenia. Changes in the diurnal rhythm and psychiatric mental status on withdrawal of drugs." *Psychiatr. Clin. (Basel)* **4**: 237-246 (1971). G86,703/71

Franzén, G.: "Plasma free fatty acids, serum cortisol and circulatory response to insulin in acute schizophrenic men." *Psychiatr. Clin. (Basel)* **5**: 201-208 (1972). G92,339/72

The plasma FFA elevations caused by insulin were increased in schizophrenics, but there was no clear parallelism between these results and plasma cortisol. Schizophrenics showed a positive correlation between FFA and blood glucose values in response to insulin whereas normal subjects exhibited a negative correlation, suggesting defective homeostasis in schizophrenia.

Saldanha, V. F., Havard, C. W. H., Bird, R., Gardner, R.: "The effect of chlorpromazine on pituitary function." *Clin. Endocrinol. (Oxf.)* **1**: 173-180 (1972). H56,815/72

In schizophrenics the circadian plasma corticoid level remained normal following treatment with chlorpromazine. The rise in plasma corticoids after insulin hypoglycemia or ACTH was only insignificantly diminished, and chlorpromazine caused no significant drop in plasma STH.

Silbergeld, S., Noble, E. P.: "Corticosteroids in psychiatric patients: subacute and diurnal effects on free fatty acid and catecholamine metabolism." *J. Psychiatr. Res.* **10**: 59-71 (1973). J4,364/73

In a group of psychotics (including depressives, schizophrenics and anxiety-types), "dexamethasone achieved a significant lowering in mean plasma levels of cortisol, corticosterone and FFA after treatment for one, 22, and 15 days, respectively. Significant differences were not obtained in NE excretion between the two experimental groups, but significant increases in mean daily urinary NE/E ratios were obtained after treatment for 7, 14, 24 and 28 days. Diurnal results from the final 24-hr periods (days 28 and 29) suggest that dexamethasone significantly lowered the mean plasma level of cortisol throughout the day. However, the mean levels of corticosterone and FFA were significantly reduced at the 7 a.m. interval only. Dexamethasone did eliminate significant diurnal variation in the mean levels of these corticosteroids, but did not do so for FFA" (45 refs.).

Carroll, B. J.: "Limbic system-adrenal cortex regulation in depression and schizophrenia." *Psychosom. Med.* (In press).

J20,864/

In depressed patients, unlike in schizophrenics, the free cortisol excretion and the cortisol content of the CSF are high and do not respond to dexamethasone suppression. Thus, "a psychoendocrine distinction can be made between primary depressive illness and secondary depressive symptomatology, and psychological defense breakdown is not related to these neuroendocrine observations."

G65,013/69

In rats exposed to ionizing radiation or "acceleration stress," the plasma concentration of phosphatidylglycerol was consistently increased. "Extension of the studies to humans stressed by acceleration to grayout,

sleep deprivation, schizophrenia, combat, etc., revealed that all stresses were accompanied by significant increments in plasma phosphatidyl glycerol." In rats, hypophysectomy prevented the increase in phosphatidyl-

glycerol induced by acceleration stress, but a rise in the brain level of this compound was observed even in the absence of the pituitary.

Manic-depressive Disease

It is especially noteworthy that the first episode of depression or mania is often precipitated by environmental stressors.

In general, the corticoid and catecholamine levels of plasma and urine are reported to be high in manic-depressive patients, particularly during acute exacerbations of the disease, and return toward normal under the influence of treatment with appropriate psychotropic drugs. Allegedly, excretion of 17-KGS is significantly correlated with the clinical symptomatology of depressive patients.

Most investigators concur that urinary 17-OHCS excretion increases, particularly during exacerbations of both the manic and depressive phases. This finding would agree with the view that the hormonal changes are secondary to the stress created by the disease and are not factors of pathogenic significance. However, certain observations on patients with Cushing's syndrome or those treated with ACTH and glucocorticoids "support the possibility of a primary brain state alteration which results in both a depressive affect associated with loss of ego-defense strength and in stimulation of the hypothalamic-pituitary-adrenal axis."

Some investigators especially point out that the changes in plasma 11-OHCS connected with depressive or manic illness are surprisingly mild, considering the mental anguish felt by many of these patients. It has even been claimed that in about 30 percent of depressives, the corticoid levels are lower before than after recovery, because the abnormal mental mechanisms in this disease "reduce the inner experience of stress." Only in stages of acute psychotic turmoil, associated with disruption of ego defenses, did the corticoid levels rise. Patients in stages of organized chronic or stable depression showed no evidence of adrenocortical hyperactivity. However, the relevant literature, though extremely voluminous, is most contradictory, and many investigators claim to have found consistently elevated plasma and/or urinary corticoid levels during depression.

The circadian rhythm of corticoid production has also been claimed to be altered in some depressed patients.

Dexamethasone diminishes the plasma cortisol level in manic-depressives, whereas treatment with lithium carbonate usually (but not always) raises it, perhaps because it produces a "general stress reaction."

In one extensive study, depressives showed elevated plasma and urinary corticoid levels with a disturbed circadian rhythm and resistance to dexamethasone suppression of corticoid production. All these changes disappeared after successful treatment of the depression.

On the other hand, in some carefully conducted clinical studies, the midnight dexamethasone suppression test was ineffective in depressives. It was concluded that "resistance to dexamethasone suppression correlated with the clinical rating of the severity of depression while recovery from depression was associated with the return of normal responsiveness to dexamethasone."

In depressives, the plasma cortisol increase following insulin hypoglycemia is significantly impaired before treatment, particularly among those resistant to dexamethasone suppression.

It appears that those depressives whose corticoid secretion can readily be suppressed by dexamethasone also respond well to antidepressant drug therapy, in contrast to subjects who do not respond with suppression of 11-OHCS secretion after dexamethasone administration.

Curiously, agitation was significantly greater in depressives whose plasma cortisol levels were not suppressed by dexamethasone. However, even in this respect the literature is contradictory; some investigators claim that dexamethasone suppression of corticoid secretion is not altered either in bipolar or in unipolar depressives, and that the circadian variations are likewise normal.

Special attention has been called to the fact that many patients suffering from Cushing's disease and from depression share the following disturbances: (1) abnormal circadian cortisol rhythms, (2) impaired cortisol suppression by dexamethasone, (3) impaired cortisol response to hypoglycemia and (4) elevated cortisol secretion rates. According to these investigations, successful lithium treatment of the depression also reverses the hypothalamo-pituitary-adrenal disturbances. The high unbound plasma cortisol levels are likewise uninfluenced by dexamethasone in both Cushing's disease and depression. It appears that men with unipolar depression have a significantly lower cortisol-binding capacity than normals.

In depressives considered to be suicidal risks, a high percentage of those with elevated plasma cortisol levels subsequently did commit suicide. Hence a high plasma cortisol level may reflect vulnerability to suicide and may perhaps even be causative. (For additional data, cf. Suicide under Neuropsychologic Stimuli.)

Among other biochemical changes possibly related to depression, the literature contains data on 5-HT and related compounds, such as EP, NEP, dopamine, VMA, IAA, kynurenine, metanephrine, normetanephrine, tryptophan pyrolase, plasma FFA, 5-HIAA and so on.

Allegedly, a small group of depressed patients failed to secrete STH adequately after an insulin tolerance test.

Chlorpromazine reduces the increase in urinary 17-OHCS following intravenous ACTH in depressive and mixed psychoneurotic patients.

Gibbons, J. L., McHugh, P. R.: "Plasma cortisol in depressive illness." *J. Psychiatr. Res.* **1**: 162-171 (1963). E37,690/63

In depressed patients, elevated blood cortisol levels were found before treatment, but these declined upon recovery after treatment with antidepressants.

Brambilla, F., Nuremberg, T.: "Adrenal cortex function of cyclotimic patients in depressive phase." *Dis. Nerv. Syst.* **24**: 727-731 (1963). E35,424/63

A high percentage of depressive patients "show androgen and cortisone secretion of the low-normal limits. The ACTH test, negative in one third of the cases, is dissociated in half of the patients, with a good response in the cortisonic series and absent response with the androgens" (45 refs.).

Pryce, I. G.: "The relationship between 17-hydroxycorticosteroid excretion and glu-

cose utilization in depressions." *Br. J. Psychiatry* **110**: 90-94 (1964). G13,357/64

Kurland, H. D.: "Urinary steroids in neurotic- and manic-depression." *Proc. Soc. Exp. Biol. Med.* **115**: 723-725 (1964).

F6,686/64

In male neurotic- and manic-depressive patients, urinary 17-KGS excretion was elevated, but that of 17-KS and 17-OHCS was not.

Gibbons, J. L.: "Cortisol secretion rate in depressive illness." *Arch. Gen. Psychiatry* **10**: 572-575 (1964). G14,359/64

In depressed patients, elevated cortisol secretion rates were characteristic, and relief of depression coincided with a decrease in these values.

Kurland, H. D.: "Steroid excretion in depressive disorders." *Arch. Gen. Psychiatry* **10**: 554-560 (1964). G18,931/64

"The excretion of 17-KGS for the total group of ten patients was significantly correlated with the clinical depressive symptomatology. Significant increases in the relative amounts of urinary 17-KGS, 17-KS, and 17-OHCS accompanied the intensification of clinical symptoms. However, only the 17-KGS were excreted in greater absolute quantities than would be expected from comparable groups of normal control subjects. The diurnal variation in the excretion of all these compounds revealed that the highest rate occurred during the early morning hours and then progressively decreased throughout the day and night."

Martinis, C. de, Doglio, R., Fonzo, D., Gandiglio, G.: "Studi sui rapporti tra sistema nervoso centrale ed attivita' corticosurrenale. I. La funzione corticosurrenalica nelle psicosi maniaco-depressive" (Study on the relationship between the central nervous system and adrenocortical activity. I. Adrenocortical function in manic-depressive psychoses). *Folia Endocrinol. (Roma)* **18**: 157-180 (1965). F50,445/65

In seven manic-depressive patients, plasma cortisol, 17-OHCS, 17-KS and urinary creatinine excretion (both under normal conditions and after ACTH, dexamethasone, or metyrapone treatment) were found to differ from the norm, suggesting some derangements of the pituitary-adrenal stress mechanism (140 refs.). [The results were too complex to be meaningfully summarized here (H.S.).]

Anderson, W. McC., Dawson, J.: "The variability of plasma 17-hydroxycorticosteroids—levels in affective illness and schizophrenia." *J. Psychosom. Res.* **9**: 237-248 (1965). G36,220/65

The plasma 17-OHCS levels of disturbed depressives tended to be higher than those of schizophrenics but showed great variations in all cases (23 refs.).

Bunney, W. E. Jr., Mason, J. W., Roatch, J. F., Hamburg, D. A.: "A psychoendocrine study of severe psychotic depressive crises." *Am. J. Psychiatry* **122**: 72-80 (1965).

G31,018/65

Correlation of behavioral changes and 17-OHCS excretion in depressive crises which were usually preceded by increased environmental stress or breakdown of ego defenses.

Bunney, W. E. Jr., Hartmann, E. L., Mason, J. W.: "Study of a patient with 48-hour manic-depressive cycles. Part II. Strong positive correlation between endocrine factors and manic defense patterns." *Arch. Gen. Psychiatry* **12**: 619-625 (1965).

G29,865/65

"Psychiatrists have suggested in the past that mania is a defense against the distress or pain of depression. Our findings are consistent with those of other investigators and may offer an interesting biochemical confirmation of this psychological theory." At times of intense mania, 17-OHCS levels were low and during immobile depressed days they were high.

Bunney, W. E. Jr., Mason, J. W., Hamburg, D. A.: "Correlations between behavioral variables and urinary 17-hydroxycorticosteroids in depressed patients." *Psychosom. Med.* **27**: 299-308 (1965).

G31,895/65

"The data suggest that patients in a group with high 17-OHCS levels were often more involved in the struggle with their illness, regarded their thoughts as ego alien, and tended to have ineffective defenses, while many of those severely depressed patients who showed low 17-OHCS levels tended to employ extensive denial of their illness."

Bridges, P. K., Jones, M. T.: "The diurnal rhythm of plasma cortisol concentration in depression." *Br. J. Psychiatry* **112**: 1257-1261 (1966). G43,296/66

Gibbons, J. L., Fahy, T. J.: "Effect of dexamethasone on plasma corticosteroids in depressive illness." *Neuroendocrinology* **1**: 358-363 (1966). G44,210/66

Three hours after intramuscular injection of dexamethasone in patients with endogenous depression, plasma 11-OHCS levels fell approximately as in normal subjects. "It is concluded that the feedback control of pituitary-adrenal function is intact in depressive illness."

Schwartz, M., Mandell, A. J., Green, R., Ferman, R.: "Mood, motility and 17-hydroxycorticoid excretion; a polyvariable case study." *Br. J. Psychiatry* **112**: 149-156 (1966). G37,319/66

In manic-depressives, urinary 17-OHCS excretion tends to increase during both the manic and the depressive phases, perhaps as a consequence of "non-specific 'discomfort' and motility."

McClure, D. J.: "The diurnal variation of plasma cortisol levels in depression." *J. Psychosom. Res.* **10**: 189-195 (1966).

G41,115/66

McClure, D. J.: "The effects of antidepressant medication on the diurnal plasma cortisol levels in depressed patients." *J. Psychosom. Res.* **10**: 197-202 (1966).

G41,116/66

Rubin, R. T., Mandell, A. J.: "Adrenal cortical activity in pathological emotional states: a review." *Am. J. Psychiatry* **123**: 387-400 (1966). G41,185/66

"A review of the psychoendocrine research on this subject indicates that heightened activity of the adrenal cortex occurs concomitantly with depressive reactions of various types and in certain phases of acute schizophrenic reactions. The psychological variable that appears to correlate most closely with increased adrenal cortical secretion is loss of 'ego defense strength,' that is, absence of denial, awareness of illness and suffering, anxiety, and depressive affect.... The behavioral observations and biochemical methodologies used in the studies reviewed are discussed. Data from psychiatric observations on patients with Cushing's syndrome and patients treated with ACTH and exogenous glucocorticoids support the possibility of a primary brain state alteration which results in both the depressive affect associated with loss of ego defense strength and in stimulation of the hypothalamic-pituitary-adrenal axis" (107 refs.).

Doig, R. J., Mummery, R. V., Wills, M. R., Elkes, A.: "Plasma cortisol levels in depression." *Br. J. Psychiatry* **112**: 1263-1267 (1966). G43,297/66

In hospitalized depressed patients, the mean 06:00 level of plasma cortisol was significantly above normal.

"Amines and depression." *Br. Med. J.* February 25, 1967, pp. 448-449.

F77,991/67

Letter to the editor evaluating the literature on the possible role of 5-HT, dopamine and catecholamines in depression, as related to stress and cortisol.

Brooksbank, B. W. L., Coppen, A.: "Plasma 11-hydroxycorticosteroids in affective disorders." *Br. J. Psychiatry* **113**: 395-404 (1967).

G45,651/67

"The changes in 11-OHCS are not intimately connected with a depressive or manic illness, and indeed the levels found in plasma are surprisingly normal when one considers the mental anguish felt by many of these patients. The analysis of the data suggests that 'reactive and mixed' states of depression paradoxically seem to show even less reaction as far as their morning plasma 11-OHCS are concerned, but that before and after recovery they show rather higher levels than normal. The evening plasma 11-OHCS levels seem to correlate better with the clinical state."

"Corticosteroids in depressions." *J.A.M.A.* **202**: 904 (1967).

F91,218/67

Letter to the editor. In about 30 percent of depressives, corticoid levels were lower before than after recovery. In such patients, mental mechanisms apparently "reduce the inner experience of stress." On the other hand, "those patients in stages of acute psychotic turmoil (associated with disruption of ego defenses and arousal of disintegrative anxiety) did indeed have very high corticosteroid levels, but patients in stages of organized (chronic or stable) psychosis did not."

Rubin, R. T.: "Adrenal cortical activity changes in manic-depressive illness. Influence on intermediary metabolism of tryptophan." *Arch. Gen. Psychiatry* **17**: 671-679 (1967).

G53,082/67

Urinary 17-OHCS excretion tends to increase during depression and to decrease during mania. But this is inconstant, and "the urine kynurene data suggest an increased metabolism of tryptophan via the kynurene pathway during depression and support the hypothesis of hydrocortisone induction of tryptophan pyrolase during depression" (33 refs.).

Sachar, E. J., MacKenzie, J. M., Binstock, W. A., Mack, J. E.: "Corticosteroid responses to psychotherapy of depressions. I. Elevations during confrontation of loss." *Arch. Gen. Psychiatry* **16**: 461-470 (1967). G46,637/67

Green, R.: "Morning and afternoon plasma 17-hydroxycorticosteroid levels during affective psychosis." *Int. J. Neuropsychiatry* **3**: 133-137 (1967). H9,064/67

Clower, C. G. Jr., Migeon, C. J.: "Psychoendocrine aspects of depression and ECT." *Johns Hopkins Med. J.* **121**: 227-233 (1967). G51,371/67

In depressive patients, 17-OHCS excretion tended to be elevated and to drop after successful electroconvulsive therapy (21 refs.).

Sachar, E. J.: "Corticosteroids in depressive illness. I. A reevaluation of control issues and the literature." *Arch. Gen. Psychiatry* **17**: 544-553 (1967). G51,423/67

Sachar, E. J.: "II. A longitudinal psychoendocrine study." *Arch. Gen. Psychiatry* **17**: 554-567 (1967). G51,424/67

In depressed patients the 17-OHCS excretion did not correlate well with the severity or course of the illness, but did drop slightly after recovery. The findings are somewhat at variance with the literature, but many authors failed to consider such interfering factors as the stress of admission to hospital and the tests performed (28 refs.).

Knapp, M. S., Keane, P. M., Wright, J. G.: "Circadian rhythm of plasma 11-hydroxycorticosteroids in depressive illness, congestive heart failure, and Cushing's syndrome." *Br. Med. J.* April 1, 1967, pp. 27-30. F81,858/67

Hullin, R. P., Bailey, A. D., McDonald, R., Dransfield, G. A., Milne, H. B.: "Variations in 11-hydroxycorticosteroids in depression and manic-depressive psychosis." *Br. J. Psychiatry* **113**: 593-600 (1967). G47,390/67

The plasma 11-OHCS levels were higher in depressed patients before, during, and after electroconvulsive therapy than in normal controls. There was a significant decrease in the levels of these corticoids after successful electroconvulsive therapy.

Mason, J. W.: "A review of psychoendocrine research on the pituitary adrenal cortical system." *Psychosom. Med.* **30**: 576-607 (1968). H29,040/68

Excellent review on the effect of psychologic stimuli and psychiatric disease upon the pituitary-adrenocortical axis. "Elevation of 17-OHCS levels is not related to a highly specific affective state, but rather appears to reflect a relatively undifferentiated state of emotional arousal or involvement, perhaps in anticipation of activity or coping. The elements of novelty, uncertainty, or unpredictability are particularly potent influences in eliciting 17-OHCS elevations" (222 refs.).

Sachar, E. J., MacKenzie, J. M., Binstock, W. A., Mack, J. E.: "Corticosteroid responses to the psychotherapy of reactive depressions. II. Further clinical and physiological implications." *Psychosom. Med.* **30**: 23-44 (1968).

G54,793/68

Platman, S. R., Fieve, R. R.: "Lithium carbonate and plasma cortisol response in the affective disorders." *Arch. Gen. Psychiatry* **18**: 591-594 (1968). G57,186/68

Newly admitted manic-depressives show increased levels of plasma cortisol, but these fall after recovery as well as upon treatment with dexamethasone. Lithium carbonate usually raises plasma cortisol in psychotics despite their clinical improvement, perhaps because it produces a "general stress reaction."

Butler, P. W. P., Besser, G. M.: "Pituitary-adrenal function in severe depressive illness." *Lancet* June 8, 1968, pp. 1234-1236.

F99,079/68

Depressives showed elevated plasma and urinary corticoid levels, disturbed circadian rhythm, and resistance to dexamethasone suppression of corticoid production. These changes disappeared after successful treatment of the depression.

Rimón, R., Salonen, S., Pekkarinen, A.: "Antidepressive medication and diurnal variation of plasma 17-OHCS levels in depression." *J. Psychosom. Res.* **12**: 289-295 (1968). G63,267/68

Fullerton, D. T., Wenzel, F. J., Lohrenz, F. N., Fahs, H.: "Circadian rhythm of adrenal cortical activity in depression. I. A comparison of depressed patients with normal subjects." *Arch. Gen. Psychiatry* **19**: 674-681 (1968). G62,923/68

In depressed patients, serum and urinary 17-OHCS levels were above normal throughout the day, but the nadir was reached three hours earlier than in controls.

Fullerton, D. T., Wenzel, F. J., Lohrenz,

F. N., Fahs, H.: "Circadian rhythm of adrenal cortical activity in depression." *Arch. Gen. Psychiatry* **19**: 682-688 (1968).

Carroll, B. J., Martin, F. I. R., Davies, B.: "Resistance to suppression by dexamethasone of plasma 11-O.H.C.S. levels in severe depressive illness." *Br. Med. J.* August 3, 1968, pp. 285-287. H2,689/68

In many depressives, the midnight dexamethasone suppression test is ineffective. "Resistance to dexamethasone suppression correlated with the clinical rating of the severity of depression, while recovery from depression was associated with return of normal responsiveness to dexamethasone."

Rubin, R. T., Young, W. M., Clark, B. R.: "17-hydroxycorticosteroid and vanillylmandelic acid excretion in a rapidly cycling manic-depressive." *Psychosom. Med.* **30**: 162-171 (1968). G63,129/68

Lohrenz, F. N., Fullerton, D. T., Fahs, H., Wenzel, F. J.: "Adrenocortical function in depressive states—Study of circadian variation in plasma and urinary steroids." *Int. J. Neuropsychiatry* **4**: 21-25 (1968). F93,488/68

The circadian rhythm of corticoid production is altered in some depressed patients.

Jakobson, T., Blumenthal, M., Hagman, H., Heikkinen, E.: "The diurnal variation of urinary and plasma 17-hydroxy-corticosteroid (17-OHCS) levels and the plasma 17-OHCS response to lysine-8-vasopressin in depressive patients." *J. Psychosom. Res.* **13**: 363-375 (1969) (50 refs.). G71,764/69

Sclare, A. B., Grant, J. K.: "Plasma 11-hydroxycorticosteroid concentration in depressive illness." *J. Endocrinol.* **43**: 677-678 (1969). H11,671/69

The diurnal variations in 11-OHCS excretion are significantly increased in depressives. "Patients with endogenous depression had a significantly higher plasma 11-OHCS level in the evening than those with reactive depression. Although plasma 11-OHCS changes are present in depressive illness, they are comparatively mild. They probably represent a nonspecific response to stress."

Baer, L., Durell, J., Bunney, W. E., Levy, B. S., Cardon, P. V.: "Sodium-22 retention and 17-hydroxycorticosteroid excretion in affective disorders: a preliminary report." *J. Psychiatr. Res.* **6**: 289-297 (1969).

G66,564/69

"In depression, sodium is retained to a greater extent than in less depressed, recovered and/or hypomanic states. This was correlated with increased 17-OHCS excretion in the depressed state" (16 refs.).

Carroll, B. J.: "Hypothalamic-pituitary function in depressive illness: insensitivity to hypoglycaemia." *Br. Med. J.* July 5, 1969, pp. 27-28. H13,765/69

In depressive patients the plasma cortisol increase following insulin hypoglycemia is significantly impaired before treatment, particularly among those resistant to dexamethasone suppression.

Gibbons, J. L.: "Corticosteroid metabolism in depressive illness." *Psychiatr. Neurol. Neurochir.* 72: 195-199 (1969).

H31,970/69

Sachar, E. J., Hellman, L., Fukushima, D. K., Gallagher, T. F.: "Cortisol production in depressive illness. A clinical and biochemical clarification." *Arch. Gen. Psychiatry* 23: 289-298 (1970). G78,352/70

"Adrenocortical activity in depressed patients is primarily related to dimensions of emotional arousal and psychotic disorganization rather than to depressive illness per se.... Measurements of cortisol production can help greatly in interpreting data gathered from other stress-sensitive biological systems in depressed patients" (23 refs.).

Sachar, E. J., Hellman, L., Kream, J., Fukushima, D. K., Gallagher, T. F.: "Effect of lithium-carbonate therapy on adrenocortical activity." *Arch. Gen. Psychiatry* 22: 304-307 (1970). G73,841/70

In patients with manic-depressive illness, no significant changes in plasma cortisol were noted after lithium therapy.

Mueller, P. S., Davis, J. M., Bunney, W. E. Jr., Weil-Malherbe, H., Cardon, P. V. Jr.: "Plasma free fatty acids concentration in depressive illness." *Arch. Gen. Psychiatry* 22: 216-221 (1970). G73,045/70

In fasted hospitalized depressives, morning plasma FFA levels were increased in comparison with those of normals or schizophrenics. "The averages of the ratings of depression, anxiety, and psychotic behavior correlated with average FFA concentrations. Somatic complaints, physical activity, and food intake were not significantly related to average FFA concentrations. Average urinary 17-OHCS excretion was not significantly related to the above average ratings of clinical distress."

Sharma, S. D., Shah, P. B., Acharya, P. T.: "Urinary 17-hydroxycorticosteroids levels and urine electrolytes in depression." *Dis. Nerv. Syst.* 31: 343-347 (1970).

G76,432/70

Urinary 17-OHCS levels were lower in patients with endogenous depression than in those with neurotic depression (16 refs.).

Krieger, G.: "Biochemical predictors of suicide." *Dis. Nerv. Syst.* 31: 478-482 (1970).

H47,537/70

In psychiatric patients considered to be suicidal risks, a high percentage of those with increased plasma cortisol levels subsequently committed suicide. "The elevated plasma cortisol may reflect the vulnerability to suicide and be causative" (17 refs.).

Carroll, B. J., Davies, B.: "Clinical associations of 11-hydroxycorticosteroid suppression and non-suppression in severe depressive illnesses." *Br. Med. J.* March 28, 1970, pp. 789-791.

H24,181/70

In some depressives, dexamethasone failed to exert its usual suppressive effect upon plasma cortisol. Curiously, "agitation was significantly greater in the patients whose corticosteroid levels were not suppressed by dexamethasone and adverse childhood experiences [were greater] in those whose levels were suppressed."

Shopsin, B., Gershon, S.: "Plasma cortisol response to dexamethasone suppression in depressed and control patients." *Arch. Gen. Psychiatry* 24: 320-326 (1971).

G83,553/71

"Plasma cortisol response to dexamethasone was normal in both bipolar and unipolar depressives, reactive depressives and schizophrenics. As a group, schizophrenics showed significantly higher morning cortisol values than the depressed population." The findings are discussed in connection with the possible role of stress in the pathogenesis of mental disorders (47 refs.).

Stančáková, A., Stančák, A.: "Die Ausscheidung der Cortisol-Metaboliten bei Kranken mit endogener Depression mit Berücksichtigung der Tagesschwankung der Steroidmetaboliten" (Diurnal excretion of cortisol metabolites in patients suffering from endogenous depression). *J. Steroid Biochem.* 2: 121-131 (1971).

G91,053/71

In depressives the urinary excretion of corticoids and their metabolites is diminished, particularly in the cortisone fraction. This decrease is aggravated by treatment with

thioridazine. Noteworthy changes in normal circadian variations were not observed (35 refs.).

Sclare, A. B., Grant, J. K.: "Urinary steroids in depressive illness." *Scott. Med. J.* **16**: 224-227 (1971). G93,955/71

The urinary 17-OHCS and 17-KS output of depressives shows no pronounced deviation from the norm, and hence "measurements of urinary excretion of corticosteroids in affective disorders constitute a limited source of information."

Platman, S. R., Hilton, J. G., Koss, M. C., Kelly, W. G.: "Production of cortisol in patients with manic-depressive psychosis treated with lithium carbonate." *Dis. Nerv. Syst.* **32**: 542-544 (1971). G86,455/71

Lithium carbonate increased both the secretory rate and the plasma concentration of cortisol in manic-depressives but not in normal controls.

Coppen, A., Brooksbank, B. W. L., Noguera, R., Wilson, D. A.: "Cortisol in the cerebrospinal fluid of patients suffering from affective disorders." *J. Neurol. Neurosurg. Psychiatry* **34**: 432-435 (1971).

G90,735/71

The cortisol concentration showed no significant differences among patients with depression or those with mania.

Carpenter, W. T. Jr., Bunney, W. E. Jr.: "Diurnal rhythm of cortisol in mania." *Arch. Gen. Psychiatry* **25**: 270-273 (1971).

Carroll, B. J.: "Control of plasma cortisol levels in depression: studies with the dexamethasone suppression test." In: Davies, B., Carroll, B. J. et al., *Depressive Illness. Some Research Studies*, Section 2, pp. 87-148. Springfield, Ill.: Charles C Thomas, 1972. E10,505/72

Detailed studies on the dexamethasone resistance of the pituitary-adrenocortical system in depressed patients.

Carroll, B. J.: "Plasma cortisol levels in depression." In: Davies, B., Carroll, B. J. et al., *Depressive Illness. Some Research Studies*, Section 2, pp. 69-86. Springfield, Ill.: Charles C Thomas, 1972. E10,504/72

In untreated depressed patients the circadian variations of plasma cortisol were significantly elevated but fell after treatment. Clinical features and rating scales indicated that among depressives "biologic factors" rather than anxiety were responsible for the high plasma cortisol levels.

Sachar, E. J., Hellman, L., Fukushima, D. K., Gallagher, T. F.: "Cortisol production in mania." *Arch. Gen. Psychiatry* **26**: 137-139 (1972). G88,406/72

In unanxious hypomanic patients, cortisol production rates (isotope dilution analysis) were within the normal range and did not change following successful treatment of the clinical manifestations with lithium carbonate.

Carroll, B. J.: "The hypothalamic-pituitary-adrenal axis: functions, control mechanisms and methods of study." In: Davies, B., Carroll, B. J. et al., *Depressive Illness. Some Research Studies*, Section 2, pp. 23-68. Springfield, Ill.: Charles C Thomas, 1972.

E10,503/72

The human adrenal cortex does not secrete corticoids continuously but only in discrete pulsatile episodes which appear to vary largely and to be programmed by the CNS. During endogenous depression, psychogenic stress fails to exert its normal effect upon the adrenal cortex, and the hypothalamus-pituitary-adrenal axis appears to be disturbed in a manner different from that in such psychiatric illnesses as anxiety states or schizophrenia. The hypothalamus-pituitary-adrenal feedback mechanism is analyzed in detail, including the role of the amygdala, hippocampus, midbrain and pons.

Stančáková, A., Žurindová, Z., Stančák, A.: "Der Einfluss von ACTH und Metopiron auf die Ausscheidung der Cortisol-Metaboliten bei endogener Depression im Verlauf der Thioridazin-Verabreichung" (The influence of ACTH and metopirone on the excretion of cortisol metabolites in endogenous depression during Thioridazine treatment). *Endokrinologie* **60**: 205-217 (1972). H63,651/72

"Before ACTH and Metopirone administration the depressive group already exhibited decreased values of free corticosteroids and tetrahydrogenated derivatives, extractable with chloroform. This decrease, which was found to occur predominantly in the fractions comprising cortisone, cortisol, 11-desoxycortisol, tetrahydrocortisol, allo-tetrahydrocortisol and tetrahydrocortisone, continued in the depressive patients also during ACTH administration." Excretion of cortisol metabolites during metyrapone administration was nearly normal in depressives, but the dose of the drug was probably too low. Thioridazine, like other phenothiazines, inhibited adrenocortical activity (24 refs.).

Sachar, E. J., Hellman, L., Roffwarg, H. P., Halpern, F. S., Fukushima, D. K., Gallagher, T. F.: "Disrupted 24 hour patterns of cortisol secretion in psychotic depression." *Arch. Gen. Psychiatry* **28**: 19-24 (1973). H76,340/73

Carroll, B. J.: "Hypothalamic-pituitary-adrenal (HPA) function and depression." *Int. Soc. of Psychoneuroendocrinology Ann. Meeting*, p. 4. Berkeley, Cal., 1973.

J7,393/73

Brief summary of an oral presentation on the participation of the hypothalamus-pituitary-adrenocortical system in depression. There is reason to believe that this system may sometimes be etiologically related to depression and, under other circumstances, to

euphoria. Many patients suffering from Cushing's disease and from depression share the following disturbances: "(1) abnormal diurnal rhythm of cortisol levels, (2) impaired suppression of cortisol in response to dexamethasone, (3) impaired cortisol response to hypoglycemia, and (4) elevated cortisol secretion rate." Successful treatment of depression (for example, by lithium) also reverses these anomalies in the hypothalamus-pituitary-adrenal system. Some depressed patients have unusually high free cortisol plasma levels. Also, as in Cushing's disease, dexamethasone causes little or no diminution of the high unbound plasma cortisol levels.

King, D. J.: "Plasma cortisol-binding capacity in mental illness." *Psychol. Med.* **3**: 53-65 (1973). J763/73

In a group of patients with various psychiatric ailments, plasma cortisol-binding capacity (CBC) was determined. "Men with unipolar depressive illnesses had significantly lower CBC values than men with bipolar illnesses and male controls. No other significant differences in CBC values were found and it was concluded that elevated total plasma cortisol levels in affective disorder were probably associated with increased levels of unbound cortisol."

Bugard, P.: *Stress, Fatigue et Dépression. (l'Homme et les Agressions de la Vie Quotidienne)* (Stress, fatigue, and depression. Man and the aggression of daily life), Vol. 1, p. 294, Vol. 2, p. 302. Paris: Doin Edit., 1974. E10,487/74

Two-volume monograph on stress, fatigue and depression with a special chapter on psychiatric and psychologic problems of daily life.

J20,864/

In depressed patients, unlike in schizophrenics, the free cortisol excretion and the cortisol content of the CSF are high and do not respond to dexamethasone suppression. Thus, "a psychoendocrine distinction can be made between primary depressive illness and

secondary depressive symptomatology, and psychological defense breakdown is not related to these neuroendocrine observations."

→**Other Hormones.** Funkenstein, D. H., Greenblatt, M., Solomon, H. C.: "Nor-epinephrine-like substances in psychotic and psychoneurotic patients." *Am. J. Psychiatry* **108**: 652-662 (1952). B97,013/52

"The great majority of the cases interpreted as showing excessive secretion of an *epinephrine-like substance* were diagnosed as manic-depressive or involutional psychosis; whereas the majority of the cases interpreted as showing excessive secretion of a *norepinephrine-like substance* were diagnosed schizophrenia. The response to electric shock followed the autonomic type rather than diagnostic category, as the majority of the schizophrenic patients who showed evidence interpreted as indicating excessive secretion of an epinephrine-like substance responded to electric shock therapy."

Board, F., Wadeson, R., Persky, H.: "Depressive affect and endocrine function. Blood levels of adrenal cortex and thyroid hormones in patients suffering from depressive reactions." *Arch. Neurol. Psychiatry* **78**: 612-620 (1957). J12,053/57

In depressed patients the mean blood cortisol levels are elevated, especially during periods of severe emotional distress. *PBI* levels also tend to be elevated but not significantly.

Coppen, A.: "The biochemistry of affective disorders." *Br. J. Psychiatry* **113**: 1237-1264 (1967). G51,286/67

relates of manic-depressive illness." *J. Psychosom. Res.* **12**: 171-180 (1968).

G63,713/68

"VMA excretion was higher during mania and correlated with level of physical activity. Kynurene excretion was lower during depression, possibly on the basis of heightened metabolism of kynurene during depression. IAA excretion was increased during depression, although variations in daily levels during all phases were considerable" (18 refs.).

Perez-Reyes, M.: "Differences in the capacity of the sympathetic and endocrine systems of depressed patients to react to a physiological stress." *Pharmakopsychiatrie* **2**: 245-251 (1969). G72,888/69

"In response to insulin-induced hypoglycemia, neurotic depressed patients, who had higher GSR inhibition and sleep threshold values mobilized more 17-OHCS in the plasma and *epinephrine*, *norepinephrine*, *metanephrine*, *normetanephrine* and *VMA* in the urine than normal control subjects. Psychotic depressed patients reacted adversely."

Curzon, G.: "A relationship between brain serotonin and adrenocortical secretion and its possible significance in endogenous depression." *Pharmakopsychiatrie* **2**: 234-244 (1969). G72,887/69

In depression, there are disturbances in *5-HT* metabolism and corticoid production. Experiments on rats suggest "that these disturbances may be metabolically related through the enzyme tryptophan pyrolase, synthesis of which depends upon adrenal activity" (78 refs.).

Sachar, E. J., Finkelstein, J., Hellman, L.: "Growth hormone responses in depressive illness. I. Response to insulin tolerance test." *Arch. Gen. Psychiatry* **25**: 263-269 (1971). G85,910/71

Among thirteen hospitalized depressed patients, five failed to secrete *STH* adequately after an insulin tolerance test. In contrast, all of twenty-three nondepressed age-matched subjects had adequate *STH* responses (32 refs.).

McLeod, W. R., McLeod, M. F.: "Indoleamines and the cerebrospinal fluid." In: Davies, B., Carroll, B. J. et al., *Depressive Illness. Some Research Studies*, Section 3, pp. 209-225. Springfield, Ill.: Charles C Thomas, 1972. E10,507/72

Depressed subjects have subnormal *5-HIAA* levels in the CSF, but patients suf-

fering from other psychiatric disorders do not. A positive correlation exists between the 5-HIAA values of the CSF and the plasma 11-OHCS concentrations in depressed patients both before and after the dexamethasone suppression test.

Carroll, B. J.: "Relations between serotonin and hypothalamic-pituitary-adrenal function in depression." *Int. Symp. on 5-Hydroxytryptamine and Other Indolealkylamines in Brain*, p. 11. St. Margherita (Cagliari), Italy, 1973. J7,399/73

Preliminary evidence suggesting that the high plasma free cortisol level and its relative resistance to dexamethasone suppression, characteristic of depressed patients, may in some way be related to derangements in 5-HT metabolism.

Messiha, F. S., Savage, C., Turek, I., Hanlon, T. E.: "A psychopharmacological study of catecholamines in affective disorders." *J. Nerv. Ment. Dis.* **158**: 338-347 (1974). J12,820/74

In the majority of manic patients, dopamine excretion was increased at the height of the manic phase and returned to normal following successful lithium treatment.

Matussek, N., Ackenheil, M., Athen, D., Beckmann, H., Benkert, O., Dittmer, T., Hippius, H., Loosen, P., Rüther, E., Scheller, M.: "Catecholamine metabolism under sleep deprivation therapy of improved and not improved depressed patients." *Pharmakopsychiatrie* **7**: 108-114 (1974). J12,520/74

Sleep deprivation is often but not invariably effective as a transitory treatment in certain types of depressed patients. NEP and VMA elimination is increased in those with definite improvement, but not in the others.

Shopsin, B., Wilk, S., Sathananthan, G.,

Gershon, S., Davis, K.: "Catecholamines and affective disorders revised: a critical assessment." *J. Nerv. Ment. Dis.* **158**: 369-383 (1974). J12,823/74

A review of the literature on the possible role played by *catecholamines* in the pathogenesis of affective diseases shows that most pertinent views were based on relationships between the clinical effects of reserpine, MAO inhibitors, tricyclic antidepressants, L-dopa, α -MT, physostigmine and so on, and their pharmacologic actions upon adrenergic and cholinergic mechanisms. No definite conclusion is reached, but it appears unlikely that catecholamines alone might explain the development of affective disorders.

Schildkraut, J. J.: "Biogenic amines and affective disorders." *Annu. Rev. Med.* **25**: 333-348 (1974). J12,641/74

Review of the literature and personal observations indicate that "different subgroups of patients with depressive disorders may exhibit different specific abnormalities in the metabolism of norepinephrine or other biogenic amines," particularly dopamine and 5-HT. The relationship between stress and metabolic changes in these substances is considered, but is not regarded as of proven significance (119 refs.).

→**Metabolites.** Rubin, R. T., Clark, B. R.: "Tryptophan pyrolase induction in patients with manic depression." *Science* **165**: 1146-1147 (1969). H16,528/69

Hafner, R. J.: "Physiological changes with stress in depression and obsessional neurosis." *J. Psychosom. Res.* **18**: 175-179 (1974). J15,135/74

Comparative studies on the salivary flow and sodium/potassium ratio in the saliva of depressed and obsessional subjects.

Toxicomanias (including Alcoholism)

[See also Experimental Neuroses (including Toxicomanias)]

Various toxicomanias, including alcoholism, have been ascribed to stress, particularly the distress of being unable to cope with life situations, which engenders the desire to replace stark reality with the pleasant sensations and fictitious world offered by drugs.

The most common among these defense mechanisms is the craving for alcohol, for which treatment with glucocorticoids has been recommended but with very little practical success.

It has been claimed that certain people are genetically predisposed to alcoholism, that this is associated with evidence of hypocorticoidism and hypoglycemia, and, further, that chronic alcoholics go "through the stages of alarm reaction, resistance, and eventually exhaustion," but there is little tangible evidence with which to support such a view. Chronic alcoholics show a diminished excretion of certain corticoid metabolites after surgical trauma, but this appears to be a consequence of impaired steroid metabolism rather than of defective corticoid secretion.

About twelve hours after acute alcohol withdrawal, the 09:00 plasma cortisol level was above normal and then fell upon ingestion of moderate amounts of alcohol, instead of rising as it did in healthy controls.

In methadone-treated heroin addicts, the pituitary corticoid feedback (metyrapone) and stress (insulin hypoglycemia) mechanisms appear to function normally, but the circadian periodicity of corticoid production is often deranged. Heroin addicts not on methadone display a normal corticoid response to insulin and a normal fasting blood sugar level. However, their hyperglycemic reaction to oral glucose is delayed.

On the whole, it can be said that although stress may be involved in the motivation for toxicomanias, there is little evidence of a consistent and severe derangement in the hormonal responses to stressors that could be ascribed to drug addiction.

Toxicomanias (including Alcoholism)

(See also our earlier stress monographs, p. xiii)

Tintera, J. W., Lovell, H. W.: "Endocrine treatment of alcoholism." *Geriatrics* **4**: 274-280 (1949). B41,221/49

Alcoholism is viewed as a disease of adaptation, and a combined hormonal (mainly adrenocortical extract) and dietary treatment is recommended, mostly on speculative grounds.

Izikowitz, S., Mårtens, S., Dahlbom, L.: "On the cortisone treatment of alcoholism." *Acta Psychiatr. Scand.* [Supp.] **80**: 175-180 (1952). B53,935/52

Jellinek, E. M., Isbell, H., Lundquist, G., Tiebout, H. M., Duchêne, H., Mardones, J., MacLeod, L. D.: "The 'craving' for alcohol. A symposium by members of the WHO expert committees on mental health and on alcohol." *Q. J. Stud. Alcohol* **16**: 34-66 (1955). B56,097/55

Review on the effect of stress and corticoids upon alcohol craving in experimental animals and man.

Hershenson, D. B.: "Stress-induced use of alcohol by problem drinkers as a function of their sense of identity." *Q. J. Stud. Alcohol* **26**: 213-222 (1965). J22,989/65

Reed, J. L., Ghodse, A. H.: "Oral glucose tolerance and hormonal response in heroin-dependent males." *Br. Med. J.* June 9, 1973, pp. 582-585. H72,290/73

The fasting blood sugar of heroin addicts was normal, but their hyperglycemic response to oral glucose was delayed. They had high resting insulin levels and a delayed peak after oral glucose. Their STH response was also abnormal.

Klempel, K.: "Über die Nebennierenrinden- und Schilddrüsen-Aktivität von Alkoholikern und Polytoxikomanen" (Function of the adrenal cortex and thyroid in alcoholics and "polytrop" toxicomaniacs). *Nervenarzt* **44**: 268-272 (1973). J3,906/73

In both alcoholics and "polytrop" toxicomaniacs, 17-OHCS elimination is increased (61 refs.).

Litman, G. K.: "Stress, affect and craving in alcoholics. The single case as a research strategy." *Q. J. Stud. Alcohol* **35**: 131-146 (1974). *J13,260/74*

Khantzian, E. J., Mack, J. E., Schatzberg, A. F.: "Heroin use as an attempt to cope: clinical observations." *Am. J. Psychiatry* **131**: 160-164 (1974). *J21,511/74*

The authors attempt to demonstrate that the addict's use of opiates "represents a unique and characteristic way of dealing with a range of human problems involving emotional pain, stress, and dysphoria."

Miller, P. M., Hersen, M., Eisler, R. M., Hilsman, G.: "Effects of social stress on operant drinking of alcoholics and social drinkers." *Behav. Res. Ther.* **12**: 67-72 (1974). *J20,847/74*

Various techniques of testing the voluntary intake of alcohol, comparing alcoholics and social drinkers. "Alcoholics significantly increased their operant responding to obtain alcohol following stress conditions while social drinkers did not."

Wessels, C. H.: "Psychologische Motive des Drogenmissbrauches" (Psychologic motives of drug abuse). *Med. Klin.* **69**: 1015-1026 (1974). *H87,827/74*

General review on motivation in drug

abuse, with special reference to psychologic and social stressors (44 refs.).

"Alcoholics may perceive life in different fashion." *J.A.M.A.* **229**: 630-631 (1974). *H88,692/74*

Report on a congress in which statistical studies were interpreted as indicating that alcoholics "are under constant stress because of misperceptions about the effect of life changes." They rated "various events that most people consider very stressful, such as divorce, separation, death of a spouse, or loss of a job, as requiring less life change than is, in fact, needed. However, events that most people do not perceive as very stressful—vacations, Christmas, or changes in eating and sleeping habits—were rated as higher stress items."

Takki, S., Tammisto, T.: "The effect of operative stress on plasma catecholamine levels in chronic alcoholics." *Acta Anaesthesiol. Scand.* **18**: 127-132 (1974). *J15,791/74*

In chronic alcoholics, tolerance to anesthetics is reflected in an increased sympathetic activity during "operative stress."

Glass, G. B. J., Pitchumoni, C. S., Kawashima, K.: "Gastric injury from acute and chronic alcohol use: its potentiation by stress" (abstracted). *Clin. Res.* **22**: 558A (1974). *H90,434/74*

In mice, "acute ethanol excess and stress are more important than underlying gastritis in causing mucosal injury and bleeding."

Senile Psychosis

In senile psychotic women, the plasma corticoid and eosinophil responses to the stressor effect of blindfolding for thirty minutes were excessive, but their reaction to ACTH remained normal. It was concluded that senile psychosis "might have its cause in a dysfunction of either the pituitary or the hypothalamus or both."

However, there is no clearcut evidence that senile psychosis is directly related to stress, other than the data (discussed under Theories) suggesting that aging in general is largely the consequence of the cumulative effect of the stressors to which an individual is exposed during a lifetime.

Senile Psychosis

(See also our earlier stress monographs, p. xiii)

Kral, V. A., Grad, B.: "Adrenal cortical stress effects in senility." *Can. Psychiatr. Assoc. J.* **5**: 8-18 (1960). *C87,139/60*

Studies on electrolyte and eosinophil changes in young and old people, as well as in patients with senile dementia (28 refs.).

Kral, V. A.: "Stress and mental disorders of the senium." *Med. Serv. J. Can.* **18**: 363-370 (1962). *D25,424/62*

Review of the author's work suggesting that "the lowered stress resistance of the aged may be one of the determining factors of, at least, some of the mental disorders encountered in the aged. On the other hand, stress endured in the past may play a role in the aetiology of the psychoses of the senium." However, "the mental disorders of the senium per se may be so stressful to the aging organism as to accelerate senescent decline or even precipitate death."

Kral, V. A., Grad, B., Cramer-Azima, F., Russell, L.: "Biologic, psychologic and sociologic studies in normal aged persons and patients with senile psychosis." *J. Am. Geriatr. Soc.* **12**: 21-37 (1964). F329/64

In elderly normal individuals and in senile psychotics, thirty minutes of blindfolding was used as a stressor procedure, and various determinations were made before and after this test. "Plasma corticoid levels were significantly higher in senile psychotic women than in all other persons in the study. The salivary sodium/potassium ratio was significantly higher in the patients with senile psychosis, whether male or female, than in normal elderly persons, but there was no statistically significant difference in the circulating eosinophil counts between the two main groups. However, the pattern of the eosinophilic response to blindfolding showed a statistically significant change in the senile psychotic patients but not in the normal subjects."

Grad, B., Kral, V. A., Payne, R. C., Berenson, J.: "Adrenal cortical function in the psychoses of later life." *Laval Méd.* **37**: 126-134 (1966). G37,699/66

There were no significant differences in plasma cortisol and corticosterone levels between male or female normal and senile psychotic patients. However, normal men had significantly higher urinary corticoid excretions than psychotic subjects. This difference was less obvious in women.

Kral, V. A., Grad, B., Payne, R. C., Berenson, J.: "The effect of ACTH on the plasma and urinary corticoids in normal elderly persons and in patients with senile psychosis." *Am. J. Psychiatry* **123**: 1260-1269 (1967). G45,322/67

In patients with senile psychosis, the rise in plasma cortisol and corticosterone levels following exposure to physical and psychologic stressors was excessive, but their response to ACTH remained within normal limits. This "might have its cause in a dysfunction of either the pituitary or the hypothalamus or both."

Grad, B., Kral, V. A.: "The delayed effect of ACTH administration on the plasma corticoid level of normal elderly persons and patients with chronic brain syndrome." *J. Am. Geriatr. Soc.* **17**: 15-24 (1969).

H6,490/69

"Patients with senile or arteriosclerotic brain syndrome are more reactive to stress than are normal aged subjects—their adrenal cortices are more reactive" to ACTH.

Kral, V. A.: "Stress and senile psychosis." Proc. 5th World Congr. of Psychiatry, Mexico, D.F. 1971. *Int. Congr. Ser.* No. 274, pp. 331-337 (1973). J17,514/73

Resistance to stress decreases with age. Hormonal studies indicate "firstly, that there is a decline in adrenocortical function with aging; and secondly, that patients suffering from organic psychoses of the senium, particularly senile dementia, show a tendency to a delayed adrenocortical overactivity, to ACTH stimulation as well as in stressful situations. It would appear, therefore, that cerebral pathology modified the function of the adrenal cortex."

Müller, H. F., Grad, B.: "Clinical-psychological, electroencephalographic, and adrenocortical relationships in elderly psychiatric patients." *J. Gerontol.* **29**: 28-38 (1974).

J9,661/74

Other Neuropsychiatric and Psychosomatic Diseases

Various neuropsychiatric derangements that are often regarded as neurotic have been discussed previously in the section on Neuroses. Among these are *headache*, *backache*, *bruxism* and *autism*.

It is also well known that *Parkinson's disease* is aggravated by psychogenic stressors, and that *epileptic attacks* can be provoked in predisposed individuals by a variety of stressors, particularly lack of sleep, emotional arousal and intellectual overexertion.

Stress may also play a role in *retrograde amnesia, insomnia, multiple sclerosis, susto, Huntington's disease* and so on.

The association of *mongoloid idiocy* (Down's syndrome) with a dysfunction of the hypothalamus-pituitary system has not yet been established, but appears to be probable. This disease, being congenital, has been discussed under Prenatal Stress Conducive to Malformations or Stillbirths.

Other Neuropsychiatric and Psychosomatic Diseases

(See also our earlier stress monographs, p. xiii)

Schwab, R. S., Prichard, J. S.: "Situational stresses and extrapyramidal disease in different personalities." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 48-60. Baltimore: Williams & Wilkins, 1950. B51,894/50

There appears to be a relationship between stress and *Parkinson's disease*, since its manifestations are aggravated by psychogenic stressors (12 refs.).

Barucci, M.: "Su le possibili correlazioni tra epilessia e sindrome generale di adattamento" (Possible correlations between epilepsy and general adaptation syndrome). *Folia Endocrinol. (Roma)* 8: 1027-1053 (1955). C15,159/55

There are close relationships between the G.A.S. and *epilepsy*, since epileptic fits can be caused by or act as the cause of stress.

Persky, H., Grinker, R. R., Hamburg, D. A., Sabshin, M. A., Korchin, S. J., Basowitz, H., Chevalier, J. A.: "Adrenal cortical function in anxious human subjects. Plasma level and urinary excretion of hydrocortisone." *Arch. Neurol. Psychiatry* 76: 549-558 (1956). C25,458/56

In *anxious* patients, plasma cortisol and urinary corticoid excretion were increased, but stress interviews failed to cause further rises.

Marcus, J.: "The interrelations of myasthenia gravis and psychic stress: presentation of a case." *Isr. Med. J.* 21: 178-184 (1962). D54,093/62

Patients with *myasthenia gravis* are particularly sensitive to the effects of psychic stressors.

"Akinesia paradoxica is defined as a complete loss of akinesia and disability of *Parkinson's disease* under emergency, extraordinary stimulation such as a house afire, but it lasts only a minute or two, and the patient is then back to his previous degree of disability."

Chorover, S. L., Schiller, P. H.: "Reexamination of prolonged retrograde amnesia in one-trial learning." *J. Comp. Physiol. Psychol.* 61: 34-41 (1966). J22,883/66

Electroconvulsive shock may cause prolonged *retrograde amnesia*.

Marsden, C. D., Owen, D. A. L.: "Mechanisms underlying emotional variation in parkinsonian tremor." *Neurology (Minneap.)* 17: 711-715 (1967). G48,499/67

Observations suggesting that "the effect of emotional and mental stress on *parkinsonian tremor* is mediated by release of endogenous adrenaline and by direct influence of the prefrontal cortex on brainstem reticular formation" (14 refs.).

Antonovsky, A., Kats, R.: "The life crisis history as a tool in epidemiological research." *J. Health Soc. Behav.* 8: 15-21 (1967). J23,004/67

Epidemiologic studies in Israel using a newly-developed questionnaire suggest some relationship between *multiple sclerosis* and

stress "within the framework of a multi-factor theory of etiology."

O'Neill, C. W.: "Sex differences in the incidence of susto in two Zapotec Pueblos: an analysis of the relationships between sex role expectations and a folk illness." *Ethnology* 7: 95-105 (1968). J19,563/68

Susto is a name given to an illness common in various parts of Latin America and also known as *espanto*, *miedo*, *pasmo* and *desasombro*. It has somewhat different characteristics in various locations, but in general, "the susto sufferer is listless, depressed, and timid, usually exhibiting a loss of interest in his customary affairs, and frequently complaining of poor appetite and loss of strength. In sleep, the patient is restless, often complaining of troublesome dreams or other manifestations of sleep disturbance. One of the more consistently encountered folk beliefs is that the asustado (sufferer from susto) has lost his soul to a malignant spirit and that the patient's cure rests upon the recovery of the soul through specific treatments or rites performed by a curing specialist." The condition is more common among women than among men. In the author's opinion, "susto represents an important culturally and socially sanctioned mechanism of escape and rehabilitation for persons suffering from intra-culturally induced stress resulting from failure in sex-role performance. The ethnographic evidence encountered in the two villages indicated that women stand the greater likelihood of experiencing role stress both because their sex roles are more narrowly defined than are those for men and because fewer outlets of escape from stress are open to them in this culture."

Experimental Neuroses (including Toxicomanias)

In continuation of Pavlov's classic experiments, a great deal of work has been done on the induction of neuroses by stressful conditioned reflexes.

In neurotic goats, the presence of the mother, regardless of her behavior towards her offspring, had an ameliorating effect on the nervous responses of the young to environmental stress.

Liddell, in his classic experiments on sheep and goats, used ten-second conditioned signals separated by constant time-intervals. When the interval between all signals was two minutes, a type of experimental neurosis resulted which was characterized by tonic immobility taking the form of severe muscular rigidity in a particular posture. This suggests a distorted startle pattern. Treatment with the cortical extracts available at the time these experiments were performed allegedly resulted in some improvement.

The literature on the effect of stress upon ethanol consumption in animals is contradictory. In one carefully-conducted series of experiments, intermittent electric shocks failed to affect voluntary ethanol intake in rats that exhibited their normal aversion to alcohol. However, the behavioral stress of cued, random unavoidable shock and non-cued unavoidable shock is quite different; an increase in volitional ethanol consumption occurs only following interference with a learned avoidance response.

"Isolation stress" increases the voluntary consumption of alcohol by rats that have free access to drinking water. On the other hand, intermittent electric shocks failed to influence voluntary alcohol intake in this species.

Experimental Neuroses (including Toxicomanias)

ogy of Mental Health and Disease, pp. 591-594. New York: P B Hoeber, 1952.

B68,669/52

Review on the effect of corticoids upon experimentally induced psychoneurosis in sheep, with a general outline of the relationship between these psychic disturbances and Pavlov's conditioned reflexes, Cannon's emergency theory, and Selye's G.A.S. The technique used "in the sheep or goat was to employ ten-second conditioned signals separated by constant time intervals. When the interval between all signals was two minutes a type of 'experimental neurosis' resulted which we have characterized as tonic immobility. At the signal the animal reacts with pronounced muscular rigidity, lifting the stiffly extended forelimb from the shoulder instead of flexing it freely in anticipation of the electric shock as the normal animal does. This neurotic pattern suggests a frozen and distorted startle pattern." Treatment with the cortical extracts available at the time of the first experiment revealed improvement, whereas EP (usually present as a contaminant) appeared to aggravate this effect. [The paper was followed by an invited discussion

in which Selye summarized the pertinent aspects of his G.A.S. concept (H.S.).]

Eränkö, O., Muittari, A.: "Effects of experimental neurosis on the thyroid and adrenal glands of the rat." *Acta Endocrinol.* (Kbh.) **26**: 109-116 (1957). C40,371/57

In rats that developed a neurosis owing to the frustration of conditioned reflexes, the resulting adrenal and thyroid hypertrophy was ascribed to the G.A.S.

Casey, A.: "The effect of stress on the consumption of alcohol and reserpine." *Q. J. Stud. Alcohol* **21**: 208-216 (1960).

Discriminated shock avoidance tasks increased the voluntary ethanol intake of rats when unavoidable random shock signals were simultaneously delivered. During control shock avoidance periods, or when noncued unavoidable shocks were delivered, the animals exhibited their normal aversion to etha-

nol. The behavioral stress of cued random unavoidable shock and noncued unavoidable shock must be clearly distinguished in this respect. "For the first time a relationship has been established in animals between a so-called psychological stressor and the volitional selection of ethanol" (14 refs.).

Gowdey, C. W., Klaase, J.: "Voluntary alcohol consumption and avoidance learning by rats. Lack of correlation." *Q. J. Stud. Alcohol* **30**: 336-344 (1969). G66,874/69

Wright, J. M. von, Pekanmäki, L., Malin, S.: "Effects of conflict and stress on alcohol intake in rats." *Q. J. Stud. Alcohol* **32**: 420-433 (1971). G84,239/71

In rats repeatedly exposed to the stressor effect of electroshocks, voluntary alcohol consumption may increase although drinking water is also available ad libitum.

Opsahl, C. A., Hatton, G. I.: "Volitional ethanol increases during acquisition and extinction of avoidance responding." *Physiol. Behav.* **8**: 87-93 (1972). G90,591/72

"In a discriminated shock avoidance situation, rats offered a choice between water and ethanol increased their ethanol consumption significantly during acquisition of the avoidance response and when random unavoidable shock signaled by a warning light was simultaneously delivered." However, the thymus and adrenal weights did not change significantly, and plasma corticosterone levels were only minimally elevated. Literature concerning increased voluntary ethanol consumption in stressed animals is quoted (15 refs.).

J21,237/74

The stressor effect of inescapable shock increased self selection of alcohol.

Hill, S. V., Goldstein, R.: "Effect of p-chlorophenylalanine and stress on alcohol consumption by rats." *Q. J. Stud. Alcohol* **35**: 34-41 (1974).

J13,259/74

PCPA caused a marked depletion of brain 5-HT and reduced volitional alcohol intake in the rat. Under certain conditions this effect could be inhibited by stressors (for example, electroshock). Indeed, there is no evidence that under ordinary conditions PCPA induces avoidance of alcohol (20 refs.).

Parker, L. F., Radow, B. L.: "Isolation stress and volitional ethanol consumption in the rat." *Physiol. Behav.* **12**: 1-3 (1974).

J9,601/74

Isolation increases the voluntary consumption of ethanol by rats who have the alternative of drinking water. This change is ascribed to "isolation stress."

OTHER DISEASES OF ADAPTATION

Diabetes Mellitus

There can be no doubt that predisposition to diabetes is a genetically-inherited trait. However, in predisposed individuals, exposure to severe stressors can precipitate its development while in cases of mild, controlled diabetes, stress undoubtedly aggravates the condition and may provoke an increase in blood ketones and considerable fluctuations in blood sugar, which increase requirements for insulin or oral antidiabetic drugs. In this respect not only physical but also psychogenic stressors may act as precipitating agents.

Stress produces polyuria in both normal and diabetic persons; however, in the latter, this may be accompanied by a massive loss of glucose and electrolytes, which contributes to the development of dehydration and coma. The theory is advanced that in diabetes an appropriate, normal adaptive response to starvation (associated with

stress) may assume pathogenic importance. In any event, several investigators concluded that "diabetes mellitus is a disorder of adaptation, and that persons showing this disorder react to various life stresses with a physiological response which is appropriate to starvation, but ineffective in dealing with the stresses to which they have been exposed."

Another group of investigators found that in patients undergoing surgery the glucose tolerance curves assume a diabetic pattern. They came to essentially the same conclusion: "the hyperglycemia occurring after hemorrhage and after tissue injury is presumably a purposeful metabolic alarm reaction tending to maintain an adequate supply of fuel to the brain and peripheral nerves during stress conditions," but in predisposed individuals it may precipitate diabetes.

In rats, steroid diabetes caused by cortisone overdosage is ameliorated by carcinoma transplants, surgery, toxicants and other stressors, although these stimulate endogenous glucocorticoid secretion and hence would be expected to induce an inverse response. Here the situation is probably quite different from that which exists in patients hereditarily predisposed to diabetes. Catecholamines inhibit insulin release by stimulation of pancreatic alpha receptors and raise it by stimulation of beta receptors. Hence, the insulin component in diabetes depends upon complex conditioning factors that determine whether one or the other of these effects will predominate. Activation of the sympathetic nervous system inhibits glucose-induced insulin secretion, but this effect is balanced by simultaneous stimulation of beta receptors. Intense stress may result in metabolic changes similar to those of diabetes and a poor insulin response to glucose challenge.

Diabetes Mellitus

(See also our earlier stress monographs, p. xiii)

Hinkle, L. E. Jr., Conger, G. B., Wolf, S.: "Studies on diabetes mellitus: the relation of stressful life situations to the concentration of ketone bodies in the blood of diabetic and non-diabetic humans." *J. Clin. Invest.* **29**: 754-769 (1950). B49,214/50

Various interpersonal stress situations interpreted as threats may produce an increase in blood ketones and fluctuations in blood sugar in both diabetic and nondiabetic persons. When relative emotional security is achieved the blood chemical changes subside, even without extra insulin or other therapeutic measures. These disturbances are ascribed to stimulation of the pituitary-adrenocortical axis and illustrate how psychogenic stress can unmask a latent disease tendency. The literature on stress and diabetes is discussed in detail (63 refs.).

Hinkle, L. E. Jr., Wolf, S.: "Studies in diabetes mellitus: changes in glucose, ketone, and water metabolism during stress." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life*

Stress and Bodily Disease, pp. 338-389. Baltimore: Williams & Wilkins, 1950.

B51,913/50

During stress, polyuria may occur in both diabetic and nondiabetic persons. However, in the latter a massive loss of glucose and electrolytes contributes to the development of dehydration and coma. "The life history of one diabetic person was presented; and a brief formulation of a possible meaning of diabetes mellitus as the inappropriate use of a normal adaptive mechanism to starvation because of early conditioning, and perhaps of constitutional predisposition, has been suggested" (76 refs.).

Hinkle, L. E. Jr., Edwards, C. J., Wolf, S.: "Studies in diabetes mellitus. II. The occurrence of a diuresis in diabetic persons exposed to stressful life situations, with experimental observations on its relation to the concentration of glucose in blood and urine." *J. Clin. Invest.* **30**: 818-837 (1951).

B61,253/51

"In persons with diabetes mellitus, exposure to stressful life situations may lead to a diuresis. This diuresis is characterized by a 200-500% increase in the rate of water ex-

cretion, accompanied by a rise in the excretion of chlorides and ketone bodies.... When stress diuresis occurs in diabetic persons who are glycosuric, the rate of glucose excretion rises in parallel with the rate of water excretion, and there is no major change in the glucose concentration of the urine" (34 refs.).

Hinkle, L. E. Jr., Evans, F. M., Wolf, S.: "Studies in diabetes mellitus. III. Life history of three persons with labile diabetes, and relation of significant experiences in their lives to the onset and course of the disease." *Psychosom. Med.* 13: 160-183 (1951). J5,386/51

Studies indicate that "diabetes mellitus is a disorder of adaptation, and that persons showing this disorder react to various life stresses with a physiologic response which is appropriate to starvation, but inappropriate to the deprivations which they have suffered."

Hinkle, L. E. Jr., Evans, F. M., Wolf, S.: "Studies in diabetes mellitus. IV. Life history of three persons with relatively mild, stable diabetes, and relation of significant experiences in their lives to the onset and course of the disease." *Psychosom. Med.* 13: 184-202 (1951). B37,226/51

Often the onset of diabetes occurs at times of "significant life stress." The findings reported here "are consistent with the hypothesis that diabetes mellitus is a disorder of adaptation, and that persons showing this disorder react to various life stresses with a physiological response which is appropriate to starvation, but ineffective in dealing with the stresses to which they have been exposed."

Hinkle, L. E. Jr., Wolf, S.: "The effects of stressful life situations on the concentration of blood glucose in diabetic and non-diabetic humans." *Diabetes* 1: 383-392 (1952). B75,041/52

In healthy people, stressful life experiences usually cause a fall in the postabsorptive blood glucose concentration, often to definitely hypoglycemic levels, and a rise in circulating ketone bodies. In diabetics, definite ketoacidosis sometimes ensues in association with hyperglycemia (26 refs.).

Hinkle, L. E. Jr., Wolf, S.: "Importance of life stress in course and management of diabetes mellitus." *J.A.M.A.* 148: 513-520 (1952). B66,606/52

"Study of the life histories and daily experiences of persons with diabetes indicates

that many of the apparently spontaneous fluctuations in the syndrome are the results of life stress."

Hinkle, L. E. Jr., Wolf, S.: "A summary of experimental evidence relating life stress to diabetes mellitus." *J. Mt. Sinai Hosp.* 19: 537-570 (1952). B81,801/52

In diabetics, various life stress situations can aggravate hyperglycemia and cause ketosis much more readily than in normals. Apparently, "life experiences are of great importance in the onset and course of the disease" (61 refs.).

Frank, E.: "Über die Anwendung der psychosomatischen Betrachtungs- und Forschungsweise auf Diabetes-Probleme" (Application of psychosomatic concepts to diabetes problems). *Acta Neurolog. (Wien)* 9: 286-299 (1954). J25,478/54

Review on the association of ketosis and coma with life changes and other stressors in diabetic patients (23 refs.).

Unger, R. H.: "Alpha- and beta-cell interrelationships in health and disease." *Metabolism* 23: 581-593 (1974). H86,900/74

"An inappropriately low concentration of insulin and/or high level of glucagon relative to fuel availability is observed in genetic diabetes, and in a variety of stressful illnesses such as severe infection, trauma, burns, fetal distress, and other conditions, all of which are characterized by a negative nitrogen balance" (88 refs.).

Äärimaa, M., Slätis, P., Haapaniemi, L., Jeglinsky, B.: "Glucose tolerance and in-

sulin response during and after elective skeletal surgery." *Ann. Surg.* **179**: 926-929 (1974). J13,288/74

In patients undergoing surgery the glucose tolerance curves assumed a diabetic pattern. Insulin secretion was suppressed on the day of operation but rose above pre-

operative values in the postoperative period. "The hyperglycemia occurring after hemorrhage and after tissue injury is presumably a purposeful metabolic alarm reaction tending to maintain an adequate supply of fuel to the brain and peripheral nerves during stress conditions."

Hypoglycemia and Hyperinsulinism

Whether true hyperinsulinism can occur as a consequence of stress remains to be proven. However, a great deal has been written about a type of "pernicious fatigue" present especially on arising with a recurrence in the afternoon. This is often accompanied by overactivity of the parasympathetic system, with periods of dizziness, weakness, headaches and a general feeling of misery and anxiety. The glucose tolerance curves are usually flat.

Without any convincing reason, the syndrome has often been ascribed to hypoglycemia, and led to the organization of the Hypoglycemia Foundation in the U.S.A. Pernicious fatigue is especially common among neurotic patients, and is often treated (without much justification) by adrenocortical extracts rather than by pure natural or synthetic corticoids.

Hypoglycemia and Hyperinsulinism

(See also our earlier stress monographs, p. xiii)

Rennie, T. A. C., Howard, J. E.: "Hypoglycemia and tension-depression." *Psychosom. Med.* **4**: 273-282 (1942). B19,676/42

Description of a syndrome designated "functional hypoglycemia" which can occur in a predisposed patient "when any one of the many factors of [the] normal homeostatic mechanism [of blood sugar] is interfered with." It is especially common among patients with a variety of neuropsychiatric disturbances and appears to be the result of these, since it disappears when the latter are successfully treated. This syndrome is often difficult to distinguish from adrenocortical deficiency or hyperinsulinism.

Portis, S. A.: "Life situations, emotions and hyperinsulinism." *J.A.M.A.* **142**: 1281-1286 (1950). B51,914/50

Extensive review of the literature and personal observations suggesting that "life situations and emotions may produce a symptom complex resulting in fatigue. There is experimental and clinical evidence

to show that hyperinsulinism is a possible mechanism."

Raichle, M. E., King, W. H.: "Functional hypoglycemia: a potential cause of unconsciousness in flight." *Aerosp. Med.* **43**: 76-78 (1972). J20,017/72

In a student pilot, functional hypoglycemia with unconsciousness developed during acceleration a few hours after a high carbohydrate meal.

Kaye, P. L.: "'Pernicious' fatigue. Identification, pathogenesis, and treatment." *Behav. Neuropsychiatry* **5**: 24-29 (1974).

H88,050/74

Description of a type of "pernicious fatigue" which has a clearly diurnal cycle: present on arising, then relieved; recurring in the afternoon and again relieved in the evening. One of the manifestations of this syndrome is an overactivity of the autonomic particularly the vagal system, with periods of dizziness, weakness, headaches and a general feeling of misery and anxiety. Frequently there are flat glucose tolerance curves among these patients, but this is regarded as a symptom, not a cause, of the malady. Atropine is recommended to relieve the manifes-

tations. The syndrome of pernicious fatigue has often been ascribed to a low blood sugar level, and there is an organization called the Hypoglycemia Foundation (claiming a five hundred-physician membership)

which, according to the author, makes claims and has methods of treatment that are entirely unjustified. "The syndrome is best conceived as a common physiologic reaction to stress" (10 case reports, 7 refs.).

Thyroid Diseases

Emotional stress often precedes the appearance of hyperthyroidism and probably often plays an important part in eliciting this disease.

Allegedly, increased cortisol production during stress could predispose both to Graves' disease and Hashimoto's thyroiditis, for it is hypothesized that these conditions are due primarily to inherited defects in immune surveillance, permitting specific thyroid-directed clones of thymus-dependent lymphocytes to survive.

"Stress often precedes the onset of hyperthyroidism. A study of 116 patients shows that stresses vary by age groups."

Volpé, R., Farid, N. R., Westarp, C. von, Row, V. V.: "The pathogenesis of Graves' disease and Hashimoto's thyroiditis." *Clin. Endocrinol. (Oxf.)* **3**: 239-261 (1974). H88,160/74

Review of the literature on the role of stress in precipitating hyperthyroidism. The increased cortisol production during stress which results in a suppression of immune reactions could affect both Graves' disease and Hashimoto's thyroiditis, according to a hypothesis that these syndromes "are due primarily to inherited defects in immune surveillance, permitting specific thyroid-directed clones of thymus-dependent (T) lymphocytes (arising at random throughout life, normally through mutation) to survive, interact with their previously normal complementary antigen (presumably on the thyroid cell membrane) and establish a cell-mediated immune (CMI) reaction. This contact would presumably cause the specific clone of sensitized T-lymphocytes to replicate and expand. In addition, these T-lymphocytes appear to direct (and cooperate with) groups of bursa-equivalent (B) lymphocytes which in turn produce humoral immunoglobulins. In the case of Graves' disease, the important immunoglobulins would appear to be the

IgG thyroid stimulators, i.e. long acting thyroid stimulator" and related factors.

Hadden, D. R., McDevitt, D. G.: "Environmental stress and thyrotoxicosis. Absence of association." *Lancet* September 7, 1974, pp. 577-578. H91,773/74

During the three years preceding and the three years following the beginning of unrest in Northern Ireland, no statistically significant change in the incidence of thyrotoxicosis was noted, "which supports the concept that environmental stress is not important in the pathogenesis of this disease."

Redding, R. A., Pereira, C.: "Thyroid function in respiratory distress syndrome (RDS) of the newborn." *Pediatrics* **54**: 423-428 (1974). J17,458/74

In premature babies with respiratory distress syndrome the mean total serum thyroxine level is usually subnormal. "An association between lung immaturity and fetal thyroid function is postulated."

Newmark, S. R., Himathongkam, T., Shane, J. M.: "Hyperthyroid crisis." *J.A.M.A.* **230**: 592-593 (1974). H94,368/74

Thyrotoxic storm often arises in predisposed patients during "surgical stress" or "stressful" medical illness" such as uncontrolled diabetes, trauma or infection.

Hoffenberg, R.: "Aetiology of hyperthyroidism-II." *Br. Med. J.* August 24, 1974, pp. 508-510. H94,297/74

In predisposed individuals, stressors may precipitate the onset of hyperthyroidism. However, several statistical studies are cited showing that this is not always the case (146 refs.).

Carter, J. N., Eastman, C. J., Corcoran, J. M., Lazarus, L.: "Effect of severe, chronic illness on thyroid function." *Lancet* October 26, 1974, pp. 971-974. H94,571/74

In patients with severe chronic, non-thyroidal illnesses, the mean total serum T₃ levels are reduced to the hypothyroid range, apparently as a result of decreased conversion of T₄ to T₃. Depressed production of TTH-RF secondary to stress or under-nutrition may also contribute by reducing thyroidal hormone output. [The apparently contrary observations on hyperthyroidism precipitated by stress are not discussed (H.S.).]

Cushing's Disease

Since Cushing's disease may be due to a derangement in the hypothalamic CRF-regulating mechanism, research has been done to determine whether this malady is caused by an upward setting of the ACTH feedback control mechanism. However, this could not be demonstrated. On the other hand, the diurnal rhythm of ACTH production is disturbed in Cushing's disease and dexamethasone suppressibility of ACTH secretion is inhibited, just as it is in severe depression.

Cushing's Disease

(See also our earlier stress monographs, p. xiii)

Besser, G. M.: "Response to stress." *Br. Med. J.* October 17, 1970, p. 176.

H31,436/70

Cushing's disease may be due to a defect in the hypothalamic mechanism controlling the secretion of CRF, and hence of ACTH and corticoids, rather than to a primary lesion within the pituitary. "It is unlikely that Cushing's disease is caused by an upward resetting of the feedback control mechanism resulting from the impaired stress response, as suggested by Professor Shuster. Such a mechanism could not account for either the absence of the nyctohemeral rhythm of ACTH secretion found in Cushing's disease, or the very high basal levels of plasma ACTH after adrenalectomy. On the other hand, loss of nyctohemeral rhythmicity and dexamethasone suppressibility of ACTH se-

cretion with high basal plasma corticosteroid levels may also be a feature of untreated severe depression, producing a biochemical picture indistinguishable from that found in Cushing's disease, yet we find that stress responsiveness in these patients is unimpaired." In any event, many patients with Cushing's disease show an unusually low ACTH discharge during stress (insulin hypoglycemia).

Werder, K. von, Smilo, R. P., Hane, S., Forsham, P. H.: "Pituitary response to stress in Cushing's disease." *Acta Endocrinol. (Kh.)* **67**: 127-140 (1971). H40,513/71

"The similarity in response to stress in (acutely) dexamethasone-suppressed normal subjects and those with Cushing's disease is striking. It suggests that feedback inhibition of increased ACTH secretion, rather than an intrinsic hypothalamic defect, may be the critical factor in the poor steroid response to a variety of stresses in Cushing's disease."

Immunity, Allergy and Infections

Data on Hashimoto's thyroiditis have just been cited. Publications on various cutaneous allergies, tumorigenesis in relation to immune reactions, asthma and rheumatic diseases will also be listed in special chapters, because of their importance and frequent association with maladaptation to stressful life events.

Suffice it to point out here that glucocorticoids, whose secretion is increased during stress, inhibit immunologic and allergic reactions in general; but often, psychogenic stress may precipitate attacks of *urticaria*, *hay fever*, *atopic dermatitis*, *lupus erythematosus* and various other autoimmune diseases. In children, antismallpox vaccination can cause hyperlipemia, cholesterolemia and other manifestations allegedly characteristic of the G.A.S. The mechanism through which stress can precipitate pathogenic immune reactions is not clearly understood, but it may be related to its effect upon the thymicolymphatic apparatus.

Furthermore, the anamnestic reaction in rats previously immunized (for example with paratyphoid) is elicited by stress, presumably owing to a lysis of plasmocytes in the involuting lymph nodes that liberate agglutinins. Interestingly, in allergic

subjects, though not in healthy controls, a sauna bath fails to raise the urinary excretion of 17-OHCS.

Numerous observations have shown beyond doubt that psychogenic stressors can precipitate *asthmatic* attacks in predisposed individuals. There is also some evidence of a deranged adrenal reactivity to stress in asthmatic patients, and both corticoids and catecholamines can relieve asthmatic attacks. However, there is no convincing evidence to show that asthma can be provoked by nonpsychogenic stimuli, even in predisposed patients, and hence the importance of a truly nonspecific element in its pathogenesis remains to be determined.

The concept that stress may play an important part in the pathogenesis of *rheumatic diseases*, and particularly in rheumatoid arthritis, was first suggested by animal experiments indicating that inflammatory lesions (including arthritis produced by periarticular injection of formaldehyde in the rat) are more readily caused after adrenalectomy than in intact controls. It was also noted that mineralocorticoids (DOC, aldosterone) facilitate whereas glucocorticoids (cortisone, cortisol) inhibit the development of such inflammatory lesions. This antagonistic interaction between what we named glucocorticoids (anti-inflammatory corticoids) and mineralocorticoids (proinflammatory corticoids) was later found to apply also to various other animal models of inflammation. These included certain types of experimental polyarthritis, which resembled the clinical syndrome of rheumatoid arthritis more closely than the initially used "topical irritation arthritis," produced by the injection of irritants (formalin, carrageenin).

However, the first unequivocal proof of a close relationship between rheumatoid arthritis in man and the adrenal cortex was given in 1949 when Hench and his co-workers demonstrated that cortisone can also cause a dramatic remission in patients suffering from this disease. Yet, despite many efforts, a true deficiency in glucocorticoids could not be demonstrated in rheumatoid arthritis with any regularity. Thus it has come to be regarded as a "pluricausal disease," whose development depends upon the interplay among several factors. One of these is probably an immunologic derangement that elicits inflammatory defense reactions; however, the latter are largely controlled by high blood levels of glucocorticoids. In other words, the immunologic pathogen creates a state of relative glucocorticoid deficiency in that it requires more than the normal amount of these hormones to control its tendency to produce excessive inflammation.

This complex problem is far from being solved, since some stressors (including excessive muscular exertion, cold, humidity, traumatic injuries, environmental toxicants) can provoke attacks of rheumatic or rheumatoid arthritis, while others (through their stimulation of glucocorticoid production) can elicit a beneficial, "nonspecific therapeutic action," as do exogenous glucocorticoids.

This whole topic has been discussed with particular care in our earlier stress monographs (p. xiii). In these, the interested reader will also find additional data on STH, which exerts a strong proinflammatory action, at least in animal experiments.

Through the increased production of glucocorticoids, stress predisposes both experimental animals and man to a variety of *infections*. This has been shown particularly for tuberculosis, whose development, like that of other infectious diseases, is also greatly accelerated by exogenous glucocorticoids.

On the other hand, infections often act as potent stressors and stimulate adrenocortical functions.

Immunity, Allergy and Infections

In patients, 17-KS excretion (used as an indicator of corticoid production) is usually reduced in extensive exudative tuberculosis, and is increased if the lesions are fibrotic and limited. Emotional conflict and threatening life situations cause a rise, but the interpretation of these results is difficult in view of

the nonspecificity of urinary 17-KS as an index of adrenocortical or testicular function. The extensive literature on steroid excretion and tuberculosis is reviewed (55 refs.).

G43,190/66

Discussion of the relationships between infection and the G.A.S., with major emphasis on the one hand upon microbes and their toxins as stressors, and on the other upon stress hormones as modifiers of infectious disease.

Radenbach, K. L.: "Tuberkulose, Nebennierenrindenfunktion und endokrine Störungen" (Tuberculosis, adrenal cortex function and endocrine disturbances). *Med. Welt* No. 15: 941-948 (1967). F82,347/67

Adrenocortical function may be increased or decreased in certain phases of tuberculosis in man. These changes may be related to the G.A.S., although their role is not yet known.

Goldstein, G., Mackay, I. R.: "The thymus in systemic lupus erythematosus: a quantitative histopathological analysis and comparison with stress involution." *Br. Med. J.* May 20, 1967, pp. 475-478. F81,223/67

In man, stress involution reduced the cortex of the thymus and caused the appearance of epithelial cell aggregates in the medulla with cystic Hassall's corpuscles. In lupus erythematosus, there was complete cortical atrophy due to lymphocyte depletion and disorganization of the medulla, which was largely occupied by epithelial cell aggregates and cystic Hassall's bodies. The number of plasma cells increased, and germinal centres were present in two cases. "Our interpretation is that the thymus in systemic lupus erythematosus is a target organ. There is histological evidence of extreme stress involution and of an autoimmune reaction which could augment changes usually associated with stress involution."

Zardini, V., Plastino, G.: "Contributo allo studio della fisiopatologia delle vaccinazioni. Comportamento della glicemia, lipemia e colesterinemia sotto stimolo vaccinico anti-vaioloso" (Contribution to the study of the physiopathology of vaccinations. Behavior of glycemia, lipemia, and cholesterololemia following the stimulus of an antismallpox

vaccination). *Minerva Pediatr.* **20**: 907-910 (1968). G59,176/68

In children, antismallpox vaccination caused hypoglycemia, hyperlipemia and an initial fall followed by an increase in cholesterol. These changes presumably reflect the development of a G.A.S.

Sundberg, M., Kotovirta, M.-L., Pesola, E.-L.: "Effect of the Finnish sauna-bath on the urinary excretion of 17-OH-corticosteroids and blood eosinophil count in allergic and healthy persons." *Acta Allergol.* (Kh.) **23**: 232-239 (1968). G61,502/68

Urinary 17-OHCS excretion was essentially the same in allergic and normal individuals. "During the sauna day and 24 hours after the sauna bath the healthy subjects showed a statistically significant increase in the excretion of 17-OHCS. This kind of reaction was not found in the allergics and the difference between allergics and healthy subjects was also significant." The weak response of allergics was attributed to decreased reactivity to stressors. The eosinophil count was not consistently affected by the sauna.

Review of the literature and personal observations on the effect of stress upon immune mechanisms, including those against tumorigenic viruses, and the possible participation of interferon in these phenomena (22 refs.).

Shanon, J.: "Delayed psychosomatic skin disorders in survivors of concentration camps." *Br. J. Dermatol.* **83**: 536-542 (1970). J10,417/70

"The mechanism of the delayed reaction has been discussed in terms of stress and conflict and their interaction."

Zdrodovskii, P. F., Gurvich, G. A.: *Physiologic Basis and Regulation of Immune Reactions*, p. 88. Moskva: Meditsina, 1972 (Russian). E9,933/72

Monograph on the regulation of immunologic mechanisms. The G.A.S. is intimately involved in the first anamnestic reactions. For example, in rats previously immunized with paratyphoid, the G.A.S. (produced by cold) first leads to a "passive anamnestic reaction" in which the preformed agglutinins are liberated owing to lysis of plasmocytes in the involuting lymph nodes. Later, during the stage of resistance, there is an "active anamnestic reaction," ascribed to increased synthesis, under the influence of anabolic hormone production, which follows the initial glucocorticoid discharge. Several other experiments are cited in support of the concept that the G.A.S., through the effect of adaptive hormones upon antibody formation, represents an important aspect of immunologic defense even in the adult organism. On the other hand, it has previously been well demonstrated that immunologic challenge can act as a stressor provoking the manifestations of the G.A.S.

Cazzullo, C. L., Altamura, A. C., Giordano, P. L., Pazzaglia, P.: "La corteccia surrenalica nella encefalomielite sperimentale allergica (Studio istologico nel coniglio. Con particolare riguardo allistochemica dei lipidi)" (The adrenal cortex in experimental allergic encephalomyelitis [Histologic study in rabbits. With special reference to the histochemistry of lipids]). *Morgagni Riv. Morfol. Clin.* **4** Suppl.: 1-14 (1973). H96,298/73

Asthma

(See also our earlier stress monographs, p. xiii)

McDermott, N. T., Cobb, S.: "A psychiatric survey of fifty cases of bronchial asthma." *Psychosom. Med.* **1**: 203-244 (1939). B26,613/39

In thirty-seven out of fifty cases of asthma, attacks were precipitated by emotional stimuli (22 refs.). [Stress is not specifically mentioned (H.S.).]

Stevenson, I.: "Variations in the secretion of bronchial mucus during periods of life stress." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp.

596-601. Baltimore: Williams & Wilkins, 1950.
B51,929/50

Emotional stressors may greatly stimulate bronchial mucus secretion in man. "In a patient with bronchiectasis the secretion of bronchial mucus was found to increase during periods of life stress, sometimes to as much as six to eight times the usual amount. In a patient with bronchial asthma, during an interview, increased bronchial secretion was observed to be associated with feelings of anxiety and resentment evoked by discussions of stressful life situations."

Funkenstein, D. H.: "Psychophysiologic relationship of asthma and urticaria to mental illness." *Psychosom. Med.* **12**: 377-385 (1950).
B64,759/50

Studies on psychotic patients suggest that both asthma and urticaria attacks are closely related to psychogenic stress.

Boulanger, J. B.: "Exploration du psychisme de l'astmatique. Essai de médecine psychosomatique" (Exploration of the psyche of asthmatics. A test of psychosomatic medicine). *Un. Méd. Can.* **81**: 1041-1063 (1952).
J11,571/52

Discussion of the literature with many personally observed cases of a relationship between asthma and stress.

Funkenstein, D. H.: "The relationship of experimentally produced asthmatic attacks to certain acute life stresses." *J. Allergy* **24**: 11-17 (1953).
B90,074/53

Mecholyl precipitates asthma only in asthmatic patients; it did so in eight asthmatics only during nonstressful situations and not under real-life stress-inducing conditions. This resistance may be due to the discharge of catecholamines during stress. It is difficult to reconcile these findings, however, with the repeatedly observed asthma-inducing action of real stress situations. [Possibly, the end result depends upon whether the asthma-provoking effect of stress or the contrary action of catecholamine discharge predominates (H.S.).]

Mathé, A. A., Knapp, P. H.: "Emotional and adrenal reactions to stress in bronchial asthma." *Psychosom. Med.* **33**: 323-340 (1971).
G85,739/71

When compared with normal controls, asthmatics had subnormal urinary EP values during stress (solving arithmetic problems, viewing distressing films) as well as during control periods. Initial NEP and VMA excretion rates were normal. Both urinary NEP and plasma cortisol rises were normal during stress in asthmatics. "These findings argue against a global sympathetic nervous system or adrenal cortical defect, and are consistent with the hypothesis of a specific hypothalamicadrenal medullary defect in bronchial asthma. Respiratory indices (unlike heart rate and blood pressure) differentiated between the groups: asthmatics had lower airway conductance and respiratory rate and an opposite direction of change in these indices under stress. Psychologically, asthmatic Ss exhibited a marked field indepen-

dence and, although as emotionally aroused by stressors as were controls, gave evidence of inhibition of aggressive impulses" (75 refs.).

Sly, R. M., Joseph, F., Johnson, C. M.: "Effect of exercise upon plasma cortisol and airway obstruction in asthmatic children." *Ann. Allergy* **31**: 371-374 (1973).

J5,042/73

In asthmatic children, treadmill exercise causes decreases in peak expiratory flow rate, but plasma cortisol concentrations are essentially the same as in controls. The literature shows that asthmatic children have normal resting plasma corticoid levels, although increases are observed during exacerbations of asthma, presumably because of the consequent stress. In any event, cortisol often dramatically relieves asthmatic symptoms, and some relation between the disease and the adrenal cortex must be assumed although its nature is difficult to formulate precisely (25 refs.).

Miklich, D. R., Rewey, H. H., Weiss, J. H., Kolton, S.: "A preliminary investigation of psychophysiological responses to stress among different subgroups of asthmatic children." *J. Psychosom. Res.* **17**: 1-8 (1973).

G98,343/73

Asthmatic attacks are often precipitated by stress. When asthmatic boys were criticized for their performance in solving arithmetic problems, the resulting stress caused respiratory difficulties. Some pertinent literature is reviewed (13 refs.).

Rheumatic Diseases

(See also our earlier stress monographs, p. xiii)

Thorn, G. W., Bayles, T. B., Massell, B. F., Forshaw, P. H., Hill, S. R. Jr., Smith, S., Warren, J. E.: "Studies on the relation of pituitary-adrenal function to rheumatic

disease." *N. Engl. J. Med.* **241**: 529-537 (1949). B30,384/49

In patients with rheumatoid arthritis, adrenocortical function is usually normal although subject to wide variations which show no clear correlation with the severity of the clinical manifestations. Still, the effectiveness of ACTH and cortisone therapy suggests some adrenal factor in the evolution of rheumatic diseases (26 refs.).

Hellman, L.: "The relation of life stress to arthritis." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 412-417. Baltimore: Williams & Wilkins, 1950. B51,916/50

Clinical observations suggest that "in the relation of physical or psychic stress to arthritis, the central nervous system appears, from available evidence, to act as a regulator of pituitary-adrenal function. Stress increases pituitary-adrenal activity and arthritis may occur in the subsequent phase of decreased adrenal activity in the presence of another unknown factor. However, beneficial effects in arthritis are produced by stress during the phase of increased adrenal cortical function."

Uehlinger, E., Akert, K., Pirozynski, W.: "Nebennierenrindenhormone und Gelenke" (Hormones of the adrenal cortex and the joints). *Bull. Schweiz. Akad. Med. Wiss.* **6**: 157-170 (1950). B53,765/50

Confirmation of the observation that overdosage with DOC can produce polyarthritis in the rat.

Selye, H.: "Rheumatic diseases as diseases of adaptation." *Br. Med. J.* June 10, 1950, pp. 1362-1363. B52,703/50

The Heberden Oration on the relationship between stress and rheumatic diseases.

Fassbender, H. G.: "Rheumatismus, allergisch-hyperergische Entzündung und Nebenniere" (Rheumatism, allergic-hyperergic inflammation, and the adrenals). *Virchows Arch. [Pathol. Anat.]* **321**: 275-282 (1952). G44,239/52

Although the production of rheumatic-like lesions in DOC-treated rats has been confirmed, allergy is probably also involved. "Rheumatism in man is not an 'adaptation disease' in the sense of Selye, although the adrenal hormones undoubtedly play a role in regulating the associated mesenchymal reactions and inflammation."

McLaughlin, J. T., Zabarenko, R. N., Diana, P. B., Quinn, B.: "Emotional reac-

tions of rheumatoid arthritics to ACTH." *Psychosom. Med.* **15**: 187-199 (1953). B86,816/53

"There was an apparently significant relationship between changes in stress levels and clinical response to ACTH."

Solomon, C., Cohn, T. D., Feldman, F.: "Intravenous typhoid vaccine therapy in rheumatic diseases: a correlative study of the stress phenomenon and the clinical results." *Am. Practit.* **5**: 769-775 (1954).

B99,056/54

Rheumatism is considered to be a disease of adaptation, and the beneficiary results of intravenous typhoid vaccine therapy are ascribed to stimulation of ACTH production (20 refs.).

Kelley, V. C., Ely, R. S., Done, A. K., Ainger, L. E.: "Studies of 17-hydroxycorticosteroids. VI. Circulating concentrations in patients with rheumatic fever." *Am. J. Med.* **18**: 20-26 (1955).

E53,694/55

In patients with acute rheumatic fever, plasma 17-OHCS concentrations are elevated, whereas the opposite is true in inactive rheumatic fever and Sydenham's chorea (50 refs.).

Ward, L. E., Wu, C., Hench, P. S., Mason, H. L., Slocumb, C. H., Polley, H. F., Mayne, J. G.: "Plasma 17-hydroxycorticosteroids in patients with certain rheumatic diseases and in normal persons." *Proc. Mayo Clin.* **33**: 611-626 (1958) (44 refs.).

Taller, A.: "Über die Therapie der Arthropathien mit besonderer Berücksichtigung der Plenosolkuren" (The therapy of arthropathies with special reference to plenosol treatment). *Med. Welt* No. 35: 1747-1749 (1963). E34,911/63

Various arthropathies ascribed to stress respond well to plenosol homeopathic treatment. [The alleged success rate is not impressive (H.S.).]

Taube, H.: "Rheumatismus. Wissen und Praxis" (Rheumatism. Knowledge and practice). *Berl. Med.* **15**: 252-258 (1964).

F12,174/64

Review on the relationship between rheumatism and the pituitary-adrenocortical axis, emphasizing that immunologic mechanisms probably also play a pathogenic role.

Prick, J. J. G., Loo, K. J. M. van de: *The Psychosomatic Approach to Primary Chronic Rheumatoid Arthritis*, p. 365. Assen: Van Gorcum & Comp. N.V., 1964.

E4,624/64

Monograph on psychosomatic factors in

rheumatoid arthritis, which is interpreted as a disease of adaptation dependent upon derailment of the G.A.S.

Mozziconacci, P., Binoux, M., Girard, F.: "Étude de l'activité corticotrope et du cortisol plasmatiques chez l'enfant au cours du rhumatisme articulaire aigu et de maladies infectieuses avant l'institution du traitement" (Study of plasma corticotropin and cortisol activities in children during acute articular rheumatism and infectious diseases, before treatment). *Ann. Pediatr.* **41**: 1623-1629 (1965). G30,566/65

In rheumatic children, plasma ACTH determinations indicated hypofunctioning of the pituitary-adrenal axis which appeared to be greater than that caused by infections of comparable severity. These observations are discussed in relation to the pathogenesis of rheumatic diseases (27 refs.).

Raestrup, O.: "Gelenkrheumatismus als Unfallfolge? Versicherungsmedizinische Beurteilung in der privaten Unfall- und Haftpflichtversicherung" (Can rheumatic fever result from an accident? Insurance-medical assessment in the field of private accident and liability insurance). *Münch. Med. Wochenschr.* **108**: 265-269 (1966).

F61,978/66

Clinical observations suggest that not only streptococcal and other infections but also various stressors (including excessive muscular exhaustion, cold, humidity, traumatic injuries, environmental toxicants) can be followed by characteristic manifestations of rheumatic diseases, and the latter "must undoubtedly be regarded as typical diseases of adaptation" (56 refs.).

Moos, R. H., Solomon, G. F.: "Social and personal factors in rheumatoid arthritis: pathogenic considerations." *Clin. Med.* **73**: 19-23 (1966). G40,451/66

Review of clinical observations suggesting that psychologic stressors (anger, anxiety, depression) "appear to play a role in the onset and course of rheumatoid arthritis, a disease with autoimmune features, a possible mechanism linking psychologic and physiologic events being the effect of stress-responsive adrenal cortical hormones on the immunologic system" (38 refs.).

Selye, H., Bajusz, E.: "Stress and rheumatic disease." In: Comroe, B. I., *Arthritis and Allied Conditions*, pp. 618-630. Philadelphia: Lea & Febiger, 7th ed., 1966.

G11,141/66

Compilation of the literature on the relationship between stress and collagen diseases, particularly rheumatism. Special attention is called to the effect of corticoids and STH upon the development of the most varied types of inflammation, osteolathyrism and calciphylaxis. Even when stress is not the primary pathogenic factor, it can play a decisive role by conditioning to disease susceptibility (for example, through adaptive hormones) (32 refs.).

Weintraub, A.: "Beitrag zur Psychosomatik der progredient chronischen Polyarthritiden" (Psychosomatic studies on progressive chronic polyarthritis). *Ther. Umsch.* **24**: 368-372 (1967).

G72,998/67

Review of clinical and experimental data suggesting that rheumatic diseases are due partly to stress and corticoids but also to immunologic predisposing factors. The psychosomatic origin of certain rheumatic disorders definitely indicates that they are essentially "diseases of adaptation."

Sanders, H. J.: "Arthritis and drugs. The ongoing quest to reveal its causes. Part II." *Ind. Med. Surg.* **38**: 290-308 (1969).

G69,544/69

Emotional stress frequently aggravates rheumatoid arthritis in man. Sensitivity to climatic changes may also depend upon the latter's stressor effect.

Hendrie, H. C., Paraskevas, F., Baragar, F. D., Adamson, J. D.: "Stress, immunoglobulin levels and early polyarthritis." *J. Psychosom. Res.* **15**: 337-342 (1971).

G85,722/71

After a review of the literature on the role of psychologic factors in the development of rheumatoid arthritis, the authors report personal observations indicating that questionnaire responses from patients with early polyarthritis revealed no particularly high psychologic stress ratings prior to the dis-

ease. "However, polyarthritic patients with elevated immunoglobulin levels, tended also to have increased life change scores." Hence, it is suggested that "psychological stress does act as a precipitant for rheumatoid arthritis in at least some patients and that its mode of action is via immunological processes."

Meyerowitz, S.: "The continuing investigation of psychosocial variables in rheumatoid arthritis." *Mod. Trends Rheum.* **2**: 92-105 (1971).

J20,491/71

Heisel, J. S.: "Life changes as etiologic factors in juvenile rheumatoid arthritis." *J. Psychosom. Res.* **16**: 411-420 (1972).

J19,671/72

Children who develop juvenile rheumatoid arthritis or Still's disease "tend to have recently experienced a cluster of changes in their world, higher in amount and intensity than the average child." Several life change questionnaires have been worked out for different age groups.

Crown, J. M., Crown, S.: "The relationship between personality and the presence of rheumatoid factor in early rheumatoid disease." *Scand. J. Rheum.* **2**: 123-126 (1973).

H78,166/73

Personality studies suggest that "from the complex of environmental factors relevant to the aetiology or onset of Rheumatoid Disease, there may be a sub-group of seronegative patients, especially female patients, for whom psychological stress factors are relevant."

Rimon, R.: "Rheumatoid factor and aggression dynamics in female patients with rheumatoid arthritis." *Scand. J. Rheum.* **2**: 119-122 (1973).

H78,165/73

"The possibility of two kinds of life stress and aggression dynamics profiles correlating with the presence or absence of rheumatoid factor is discussed."

Tumors

A number of investigators speculated about the possibility that stress can influence tumorigenesis. There can be no doubt about the fact that chronic local irritation of certain tissue areas by prolonged treatment with a topical stressor can result in neoplasia at the site of injury. For example, it has definitely been shown that local neoplasia can be produced by prolonged irritation of the lip by a pipe stem, of the cervix by a pessary, of the skin by solar radiation or of the connective tissue wall of a granuloma pouch in experimental animals by croton oil.

Considerably less evidence supports the assumption that systemic stress can influence tumorigenesis. Undoubtedly, the glucocorticoids secreted upon exposure to stressors do exert a moderate carcinolytic effect, and of course the stress-induced changes in the immunologic system may also influence resistance to neoplasia.

Stress caused by avoidance learning of high frequency sound had no significant effect upon the development of malignant tumors induced in mice by polyoma virus. On the other hand, in rats, restraint definitely increased susceptibility to the tumorigenic action of murine sarcoma virus.

In rats, psychogenic stress allegedly inhibits the growth of most transplanted and chemically-induced tumors, a change that allegedly may be "characteristic of the stage of resistance of the G.A.S."

Conversely, any type of tumor may produce stress manifestations, although the claim that adrenal enlargement in tumor-bearing rats is not prevented by hypophysectomy requires confirmation.

Tumors

(See also our earlier stress monographs, p. xiii, and cf Tumors under Morphologic Manifestations)

J21,153/71

In mice, the stress of isolation can produce adrenal enlargement and an increase in the speed of development of transplanted ascites tumors.

Arasa, F.: "Psique y cáncer" (Psyche and cancer). *Folia Humanist.* (Barcelona) **9**: 501-509 (1971). Also in: *Folia Clin. Int.* (Barcelona) **21**: 431-437 (1971).

G84,153/71

Speculations concerning the possible role of mental stress in the pathogenesis of cancer.

Abeatici, S., Terracini, B.: "Studio sull'interferenza dello stress (centrifugazioni ripetute) con la cancerogenesi sottocutanea nei topi" (A study of stress [repeated centrifu-

gations] interference with subcutaneous carcinogenesis in mice). *Tumori* **57**: 353-356 (1971). G88,661/71

In Swiss mice, methylcholanthrene-induced tumorigenesis was not influenced by the stressor effect of repeated centrifugation (10 refs.).

Graham, S., Snell, L. M., Graham, J. B., Ford, L.: "Social trauma in the epidemiology of cancer of the cervix." *J. Chron. Dis.* **24**: 711-725 (1971). J20,331/71

Contrary to some data in the earlier literature, the incidence of cervical cancer was not dependent upon social stressors, in a group of 447 women of various backgrounds.

Snell, L., Graham, S.: "Social trauma as related to cancer of the breast." *Br. J. Cancer* **25**: 721-734 (1971). J20,189/71

There is no evidence that psychosocial or somatic stressors play an important role in the pathogenesis of breast cancer.

Truhaut, R., Dechambre, R. P.: "Modalités de l'induction chez la souris de tumeurs pulmonaires par le benzo-(α)-pyrène; influence de la dose d'hydrocarbure aromatique et de facteurs écologiques" (Methods of induction in mice of pulmonary tumors with benzo-(α)-pyrene; influence of the dose of aromatic hydrocarbon and of ecologic factors). *C.R. Acad. Sci. (Paris)* **274**: 2263-2267 (1972). J20,220/72

Benzopyrene produces pulmonary tumors more rapidly in isolated mice than in those kept in groups of ten.

Gala, R. R., Loginsky, S. J.: "Correlation between serum prolactin levels and incidence of mammary tumors induced by 7,12-dimethylbenz[α]anthracene in the rat." *J. Natl. Cancer Inst.* **51**: 593-597 (1973).

J5,797/73

Rats that secrete large amounts of LTH after ether stress fail to develop mammary tumors under the influence of 7,12-dimethylbenz[α]anthracene.

Amkraut, A. A., Solomon, G. F., Kasper, P., Purdue, A.: "Stress and hormonal intervention in the graft-versus-host response." *Adv. Exp. Med. Biol.* **29**: 667-674 (1973).

J24,477/73

The authors quote literature which indicates that stress generally suppresses immune reaction. They then add, "We have shown such suppressive effect on antibody formation and have also reported stress-induced increases in tumor size, which are

probably a consequence of immunosuppression."

Hinton, J.: "Bearing cancer." *Br. J. Med. Psychol.* **46**: 105-113 (1973). J19,558/73

Analysis of the psychogenic stress associated with the early stages of recognition of cancer, and methods for coping with this situation.

Smith, A. E., Kenyon, D. H.: "A unifying concept of carcinogenesis and its therapeutic implications." *Oncology* **27**: 459-479 (1973). J6,692/73

Review of the literature suggests that "cancer cells are an attempt of portions of the body to recover from chronic injury, and are an overcompensation to the stress.... The greatly increased reproductive activity of the cancer cell can be seen as a localized attempt to heal stress-induced cellular disease."

Cole, W. H.: "The mechanisms of spread of cancer." *Surg. Gynecol. Obstet.* **137**: 853-871 (1973). H77,359/73

Review of the literature indicating that various stressors enhance tumor metastasis in experimental animals (125 refs.).

Seifter, E., Rettura, G., Zisblatt, M., Levenson, S. M., Levine, N., Davidson, A., Seifter, J.: "Enhancement of tumor development in physically-stressed mice inoculated with an oncogenic virus." *Experientia* **29**: 1379-1382 (1973). H80,975/73

In mice, restraint by a partial body cast produced the typical manifestations of systemic stress and at the same time increased susceptibility to the tumorigenic action of murine sarcoma virus. In the immobilized animals, "there appeared to be a smaller number of small lymphocytes due to stress and a proliferation of epithelioid elements. Hassal bodies were also involved in agreement with earlier findings of Selye. If stress or cortisone treatment results in impaired function of these structures, then the endocrine function of the thymus gland as well as its role in providing circulating cells would be disturbed." In any event, the response of the thymus during stress is assumed to increase susceptibility to the virus through interference with immune reactions.

Spackman, D., Riley, V.: "Increased corticosterone, a factor in LDH-virus induced alterations of immunological responses in mice" (abstracted). *Proc. Am. Assoc. Cancer Res.* **15**: 143 (1974). H83,767/74

In mice, LDH-virus increases blood corti-

costerone levels and causes thymus involution with lymphocytopenia, that is, a stress reaction. It is possible that LDH-virus modifies neoplastic diseases by inhibiting immune responses through its stressor effect.

Coombs, R. R. H., Castro, J. E., Sellwood, R. A.: "Adrenal hyperplasia in rats with Walker carcinosarcoma 256." *Br. J. Surg.* **61**: 136-140 (1974). H85,492/74

The adrenal enlargement of tumor-bearing rats was not prevented by hypophysectomy. Adrenalectomy inhibited tumor growth.

Howard, R. J., Simmons, R. L.: "Acquired immunologic deficiencies after trauma and surgical procedures." *Surg. Gynecol. Obstet.* **139**: 771-782 (1974). H95,043/74

In man, "surgical trauma is associated with a number of temporary deficits in the immune system which might conceivably lead to increased susceptibility to infection or tumor spread" (109 refs.).

Arasa, F.: "La problemática del cáncer vista por un médico humanista" (Problems of cancer as seen by a humanistic physician). *Folia Clin. Int.* (Barcelona) **24**: 547-557 (1974). H90,549/74

Largely theoretical considerations concerning the possible carcinogenic effect of systemic stress.

Ray, P., Pradhan, S. N.: "Brief communication: Growth of transplanted and induced tumors in rats under a schedule of punished behavior." *J. Natl. Cancer Inst.* **52**: 575-577 (1974). J11,064/74

In rats, psychogenic stress inhibits the growth of both transplanted and chemically induced tumors. This effect may be "characteristic of the stage of resistance of the G.A.S."

Pradhan, S. N., Ray, P.: "Effects of stress on growth of transplanted and 7,12-dimethylbenz [α] anthracene-induced tumors and their modification by psychotropic drugs." *J. Natl. Cancer Inst.* **53**: 1241-1245 (1974). J24,475/74

Various stressors (restraint, sound, electroshock) increased the growth of transplanted or induced tumors in rats, concomitant with an increase in adrenal and a decrease in splenic weight. Chlorpromazine abolished this protective action.

Tromp, S. W.: "The possible effect of meteorological stress on cancer and its importance for psychosomatic cancer research." *Experientia* **30**: 1474-1478 (1974). H98,793/74

Personal observations and a review of the literature allegedly "confirm the effect of meteorological stresses (in particular thermal stresses) on thermoregulatory processes and cancer development. The similarity in physiological processes during meteorological and psychological stresses may facilitate the studies on the influence of psychosomatic factors on cancer."

Riscalla, L. M.: *Consciousness. An Added Dimension in the Treatment of Cancer.* Manuscript (1975) (71 refs.). J19,683/75

Pancreatitis

Pancreatitis and even pancreatic necrosis have been noted in animals and man after exposure to various stressors. The most common clinical form of the latter is the well-known "postoperative pancreatitis." This condition may result from a particularly acute breakdown of pancreatic acinar tissue during the alarm reaction, which liberates proteolytic enzymes.

Pancreatitis

(See also our earlier stress monographs, p. xiii)

Kaplan, M. H.: "Acute and chronic relapsing pancreatitis. The clinical implications of their acceptance as diseases of adaptation." *Am. J. Gastroenterol.* **25**: 234-252 (1956). C19,305/56

"Pancreatitis is a disease of adaptation."

Brief review on stress-induced pancreatitis and gastroduodenal ulcers in man (no refs.).

Renal Diseases

The circulatory disturbances characteristic of the "shock kidney," and particularly the so-called "Trueta-Shunt," which tend to develop during very acute, severe stress, are typical of an intense alarm reaction.

A "heat stress nephropathy" tends to develop during intense physical exercise in hot climates, but its degree of nonspecificity has not yet been established.

Renal Diseases

R. J.: "Heat stress, exercise and muscle injury: effects on urate metabolism and renal function." *Ann. Intern. Med.* **81**: 321-328 (1974).
J16,296/74

Description of the "heat stress nephropathy" that develops during intense physical training in hot climates.

Gynecologic Diseases

It has been claimed that stress plays a role in the pathogenesis of premenstrual tension and pelvic congestion that may cause pain in women.

As we said in the section on Morphology, certain irregularities of menstruation, and even prolonged amenorrhea and cessation of lactation, are also common manifestations of stress.

Gynecologic Diseases

(See also our earlier stress monographs, p. xiii)

J10,395/73

"Stressful life events in connection with the onset of amenorrhoea were experienced by 36% of the women (41% if travels abroad were included) and significantly correlated to low solidity and high neuroticism scores."

Oral, Dental Diseases

Most of the work on the oral manifestations of stress is concerned with dentistry, and the majority of investigators agree that in both man and experimental animals, chronic intense stress increases the incidence of dental caries. Stress has also been reported to predispose to the development of sometimes necrotizing ulcerative gingivitis and chronic periodontitis.

Bruxism is a particularly characteristic dental manifestation of stress. According to one author, the first description of bruxism must be ascribed to St. Matthew in his warning: "And there shall be a weeping and gnashing of teeth." Several investigators have expressed the opinion that bruxism is an atavistic remnant of the biting instinct. It has been said that "on, or related to, the occasion when man is under stress, he will sharpen his teeth. To prepare for an emergency he grinds his teeth together—innately and unconsciously." Whatever its anthropologic origin, bruxism—though very common and on the border of what might be called a normal response—has been regarded as a neurotic stress-induced trait. Furthermore, the associated "stress-induced muscle activity is a contributory factor in the etiology of mandibular dysfunction." It can be assessed objectively by the EMG.

Among other oral diseases that have been attributed to stress are dental asymmetry, herpes labialis and changes in saliva secretion.

J20,565/70

Dental asymmetry may occur in various human populations as a consequence of genetic or environmental stress factors. "Genetic stress may result from inbreeding due to the finite size of the population or to a mating pattern involving consanguinity. This can lead to a reduction in population fitness because of the exposure of deleterious recessive genes in a homozygous state or, more importantly, because of a breakdown in the coadaptation of the genetic system. Indications of inbreeding stress are provided by estimates of the inbreeding coefficient, the effective population size, the amount of gene flow into the population, or by a comparison of the genetic variance of different quantitative characters with that observed in large random mating populations. Another genetic stress may result from a drastic diminution in population size, leaving too little genetic variation to adapt to a changing or extremely heterogeneous environment."

Regenbaum, G.: "Psychogenic aspects of periodontal disease. Case history." *N.Y. State Dent. J.* **36**: 609-612 (1970).

Ocular Diseases

In our earlier descriptions of the stress syndrome, we noted that in certain animal species it is associated with transient clouding of the cornea. This has subsequently been confirmed in various species and is referred to in Japan as "Komi's nonspecific corneal reaction."

In rabbits, allegedly, various stressors may also elicit experimental herpetic keratitis, at least under certain predisposing conditions.

Some observations suggest that in predisposed patients stress can produce ophthalmic zoster, foveomacular retinitis, uveitis, glaucoma, chorioretinitis and allegedly in young children, even strabismus and amblyopia.

J19,892/72

A review of the literature and the authors'

personal observations support the impression that emotional stress plays a part in the etiology of acute closed-angle glaucoma.

Miki, T., Sunada, I., Higaki, T.: "Studies on chorioretinitis induced in rabbits by stress (repeated administration of epinephrine)." *Acta Soc. Ophthalmol. Jap.* **76**: 1037-1045 (1972) (Japanese). J19,656/72

"The nonspecific ocular reaction, based on the General Adaptation Syndrome theory of Selye, was first described by Komi and Ikeda et al. in 1954. It was reported that nonspecific choroidal reaction due to stress is quite similar to central serous retinopathy of the human eye." Further studies along these lines confirmed that, in rabbits, repeated injections of EP can cause chorioretinitis.

Skin Diseases

The changes in galvanic skin resistance have repeatedly been mentioned as characteristic cutaneous responses to stress, but these cannot be considered as pathologic conditions.

Emotional stressors may elicit urticaria, exudative skin disease, "prickly heat" (miliaria rubra), Quincke's edema, psoriasis, a variety of so-called stress dermatoses, lichen sclerosus and allegedly even acne and vitiligo, contact dermatitis and eczema.

- "It is suggested that it is true of these 'stress dermatoses,' as Osler, in 1900, said of the diseases of the 'erythema group,' that (1) 'similarity of lesions may result from a variety of causes,' and (2) 'unity of cause may be associated with a variety of lesions.' It is further suggested that many of these dermatoses, which have been attributed to either allergic reactions or emotional tension, or both, may with profit be regarded as being variants of the stress response of Selye. Whether the wide variations in the response are due (1) to qualitative variations in the effect of the stressor agent, or (2) effects of the actual or apparent etiologic agent independent of its stressor effect, or (3) latent innate tendencies or individual predilections of the patient, or any two, or all three, or other as yet unknown factors, remains to be elucidated."

Gastrointestinal Diseases

Peptic ulcers and ulcerative colitis were discussed at the very beginning of the chapter on the Diseases of Adaptation, since they are the most common gastrointestinal manifestations of stress, but some investigators believe that "idiopathic celiac disease" is also due largely to psychogenic stress situations.

There is much less evidence to support the view that appendicitis can be produced by stress in man, but in rats various very acute stressors, particularly intravenous injections of histamine, tend to cause necrotizing inflammation of the cecum in the region that allegedly corresponds to the appendix (a true appendix does not exist in rats).

Nutritional Diseases (including Kwashiorkor)

Any nutritional disease causes stress, and starvation (partial or complete) is among the most commonly-used experimental stressors. The subject has been discussed at greater length in the section on agents capable of evoking the stress re-

spose. Here, we should like to mention only a few observations which suggest that, stress plays a special role at least in some nutritional deficiencies.

Studies performed in India suggested that a failure of the adrenal cortex to respond adequately to malnutrition may cause a breakdown of adaptation, resulting in the characteristic biochemical and clinical picture of kwashiorkor and marasmus, which are considered to be different facets of the same disease. Here, the growth retardation and catabolism are regarded as useful adaptations to the stress of protein-caloric malnutrition. The plasma level of somatomedine is greatly diminished in various types of malnutrition, especially in kwashiorkor.

Stress also appears to participate in the pathogenesis of vitamin C deficiency. In his classic *Treatise of the Scurvy*, Lind stated, "cold, damp, fatigue, and hard work precipitated scurvy."

Nutritional Diseases (including Kwashiorkor)

(See also our earlier stress monographs, p. xiii)

Lind, J.: *A Treatise of the Scurvy*. Edinburgh, 1753. J13,727/1753

In this classic treatise the author states that "cold, damp, fatigue and hard work precipitated scurvy."

Jaya Rao, K. S.: "Evolution of kwashiorkor and marasmus." *Lancet* April 20, 1974, pp. 709-711. H85,623/74

Studies on kwashiorkor and marasmus in India show that the two are only different facets of the same disease. "It is suggested that marasmus, characterised by severe growth retardation but remarkably well-preserved metabolic processes, represents a state of good adaptation to the stress of protein-caloric malnutrition. The response of the adrenal cortex may be crucial for this adaptation, a normal increase in plasma-cortisol helping in adequate mobilisation of muscle

protein and in maintenance of metabolic integrity. The failure of the adrenal cortex to respond adequately may represent the crucial step in dysadaptation or breakdown of adaptation, resulting in the characteristic biochemical and clinical picture of kwashiorkor" (25 refs.).

Job, J. C., Rappaport, R.: "Somatomédines et croissance" (Somatomedines and growth). *Arch. Fr. Pédiatr.* 31: 333-338 (1974). J12,952/74

The plasma level of somatomedine is greatly diminished in various types of malnutrition, especially in protein deficiencies causing kwashiorkor.

Beitins, I. Z., Kowarski, A., Migeon, C. J., Graham, G. G.: "Adrenal function in normal infants and in marasmus and kwashiorkor. Cortisol secretion, diurnal variation of plasma cortisol, and urinary excretion of 17-hydroxycorticoids, free corticoids, and cortisol." *J. Pediatr.* 86: 302-308 (1975). J21,352/75

Ménière's Disease

In patients with Ménière's disease, attacks may occur at times of stress. Curiously, the usual increase in urinary catecholamine excretion is not observed in patients with unilateral labyrinthine dysfunction.

Ménière's Disease

(See also our earlier stress monographs, p. xiii)

Gejrot, T., Fluur, E., Levi, L.: "Sympathoadrenomedullary activity during experiment-

ally provoked mental stress in patients with labyrinthine defects." *Acta Otolaryngol. (Stockh.) Supp.* 224: 260-261 (1967). G53,263/67

"In the normal subjects, experimentally induced emotional stress was accompanied by

a significantly increased excretion of urinary catecholamines. This was not the case in the patients with unilateral labyrinthine dysfunction."

Suurala, U., Gelhar, K.: "Further studies on the relationship between Ménière, psychosomatic constitution and stress." *Acta Otolaryngol.* (Stockh.) **70**: 142-147 (1970).

J20,530/70

Williamson, D. G., Gifford, F.: "Psychosomatic aspects of Ménière's disease." *Acta Otolaryngol.* (Stockh.) **72**: 118-120 (1971).

J17,102/71

Patients predisposed to Ménière's disease "showed attacks of vertigo and later tinnitus and deafness that could definitely be related to a life stress situation."

Fluur, E.: "Long-term postoperative results following selective section of the vestibular nerve in Ménière's disease." *Acta Otolaryngol.* (Stockh.) **74**: 425-429 (1972).

J17,880/72

In patients with Ménière's disease, stress may accentuate the symptoms.

Pulec, J. L.: "Symposium on Ménière's disease. I. Ménière's disease: results of a two and one-half-year study of etiology, natural history and results of treatment." *Laryngoscope* **82**: 1703-1715 (1972). J17,103/72

"Patients already suffering from a vertiginous problem will sometimes have an exaggeration of symptoms during periods of stress. Two causes seem likely: 1) stress and fatigue tend to reduce the effectiveness of the vestibular efferent system and its suppressing effect upon a malfunctioning labyrinth. When suppression is reduced the existing abnormal labyrinthine stimulation becomes evident; and 2) Ménière's patients whose etiology is allergic or metabolic and who are on the borderline of control may have inadequate adrenocortical output during these periods of stress with the subsequent exaggeration of symptoms."

Varia

Since increased corticoid production has been demonstrated in virtually every pathologic condition of any importance, a certain relationship between stress and the most dissimilar diseases has been suspected. It would serve no purpose to discuss all the relevant publications in detail here. (Malformations were dealt with in Chapter II, p. 382.) However, among the publications cited in the abstract section, the reader will find data on the possible role played by stress in *status asthmaticus*, *coronary infarct*, *bronchopneumonia*, *carcinoma of the pancreas*, *pneumococcal meningitis*, *congestive cardiac failure*, *diabetic ketosis*, *adrenocortical necrosis*, *various forms of tuberculosis*, *skin diseases*, *inguinal hernia*, *Milkman's syndrome*, *thymus hyperplasia*, *myasthenia gravis*, *cystathioninuria*, *hepatic porphyrias*, *chronic rhinitis*. Many of these diseases have already been discussed at great length in the previous pages, but relevant papers are quoted here if they report maladies in conjunction with other allegedly stress-induced derangements.

In man, the most common precipitants of *gouty attacks* "included alcohol and dietary indiscretion, local joint trauma, surgery and infection, not taking prescribed medication, and life experiences that were usually associated with feelings of tense anticipation."

Pluricausal Diseases

The concept that many maladies are not due to a single cause but to a "pathogenic situation" in which several potentially pathogenic agents must act concomitantly has proved to be very fruitful in the interpretation of the diseases of adaptation. These diseases are virtually always "pluricausal" or "multifactorial," depending as much upon stress as upon various internal and external conditioning factors.

In clinical medicine, countless observations have shown that in the presence of a potential disease producer, predisposition—that is, endogenous and exogenous conditioning—determines whether the malady will actually become evident or not. This is obvious from what we said in the preceding chapters about virtually every Disease of Adaptation. Whenever cardiovascular diseases, neuropsychiatric derangements, diabetes, hyperthyroidism, immune diseases, gastrointestinal maladies and so on become manifest upon exposure to stressful life events, it is always evident that such factors as genetic predisposition, nutrition, general physical fitness or pre-existent disease play a decisive role in determining whether or not morbid lesions develop.

In experimental medicine, a few particularly obvious examples of pluricausal diseases helped to illustrate this concept and to make it generally acceptable. At the same time, these clearcut models, in which diseases could be synthesized virtually at will by combined treatment with various in themselves innocuous agents, have answered two of the most often-voiced and best founded objections to the concept of stress and of the diseases of adaptation: (1) How could the most different agents produce the same result (namely, stress)? (2) How could the same causative factor (stress) produce the most different morbid changes?

Without the concept of pluricausal diseases, it was difficult to see how one could justify the idea of a stereotyped response to innumerable agents, when actually they all do cause different effects. This became acceptable only after we had shown that the specific effects of each agent (shivering after cold, hypoglycemia after insulin and so on) are superimposed upon the nonspecific effects of stress (for example, ACTH, corticoid and catecholamine secretion; in more severe forms, peptic ulcers, thymicolympathic involution, loss of weight and so on). On the other hand, depending upon predisposing factors, the same potential pathogen, stress, can cause more or less selective morbid lesions in the form of hypotension, cardiac infarction, peptic ulcers, neuropsychiatric derangements or migraine headache.

That this relatively simple concept has so long resisted general acceptance by the medical community is probably due to the fact that the clinical interpretation of any one case is always complicated by the unavoidable heterogeneity of the patient population; individuals differ widely from one another in terms of genetic background, nutrition, social environment and so on. The experiments on homogeneous populations of rats (in which genetic background, age, sex, nutrition and environment could be kept uniform while varying only a small number of potentially pathogenic factors) have helped us analyze pluricausal diseases under strictly reproducible conditions.

Among the clearcut pluricausal diseases that were instrumental in establishing this concept, the following are worthy of special mention:

In rats bearing a granuloma pouch, systemic stress could either inhibit or aggravate the topical damage caused by exposure of a limited tissue area to a pathogen (for example, croton oil). The result depended upon the intensity of topical irritation and of systemic stress. Mild stress usually inhibited the response to a moderately irritat-

ing topical pathogen, in that the resulting increased secretion of anti-inflammatory (syntoxic) glucocorticoids was useful in defending the tissue area against the damage of excessive defensive (inflammatory) responses. On the other hand, if the local stress (tissue irritation) was very severe, the inhibition of inflammation proved to be harmful, since it predisposed the adjacent tissue areas to necrosis and eventual perforation of the resulting abscesses, or to invasion of the blood with pathogenic bacteria which could, normally, be quarantined at the site of invasion. In fact, even when the local stimulus was only of moderate severity, extremely intense systemic stress produced such a pronounced increase in anti-inflammatory hormones that the resulting complete inhibition of the localization of an invading pathogen (by the virtual elimination of inflammatory or immunologic defense) proved to increase disease susceptibility to dangerous levels. The clarification of this constant interplay between local and systemic stress, that is to say between the L.A.S. and the G.A.S., represented an important step forward in the development of our knowledge not only of pluricausal diseases, but also of the mechanism of stress actions in general.

Since then, a great deal of work has been done in this field and several monographs have described the pluricausal nature of certain apparently quite specific morbid lesions with well-defined characteristics, both as regards their localization and the morphologic structure of the alterations that identify them.

Particular attention has been given in this connection to the various forms of *calciphylaxis* and *calcergy*, *thrombohemorrhagic phenomena*, *conditioned tissue necroses*, the *pluricausal cardiopathies* and *mineralocorticoid hypertension*. None of these depends upon any one particular pathogen in the way that paralysis of the leg muscles is caused by transection of the spinal cord, ischemic necrosis by obstruction of an end-artery, or a skin burn by contact with boiling water. In all these latter cases, we are dealing with direct pathogens that are damaging in themselves, and not with indirect pathogens, which cause disease mainly by the inappropriate or excessive defense reactions that they elicit. Here we are concerned with conditional pathogens that cause disease only under certain circumstances—that is, in the presence of special conditioning factors. For example, calciphylaxis and the thrombohemorrhagic phenomena are elicited by challengers only after suitable sensitization, which determines both the character and the localization of the resulting lesions.

It was the realization of the comparative frequency of such pluricausal diseases that led us in 1959 to state: "There begins to emerge a new and somewhat more complex pathology, in which the main objects of our study are no longer individual 'pathogens' but rather 'pathogenic situations.' "

Of course, this attempt to outline the essential characteristics of what we have called "pluricausal diseases" would be incomplete if we did not point out especially that most spontaneous maladies are between the two extremes, being neither completely moncausal nor equally dependent upon each constituent element of a "pluricausal pathogenic situation." In the vast majority of spontaneous maladies, one factor is of special importance; for example, a particular microbe, toxicant or dietary factor is the main cause of tuberculosis, botulinus poisoning or rickets. But hereditary or acquired predisposing factors for resistance may play an almost equally important part in determining whether these pathogens will or will not induce disease.

It is especially interesting in connection with the subject of this monograph that the diseases of adaptation, which are primarily due to pathogenic actions of stress, are virtually always pluricausal. Both the general predisposition to respond to stress

with disease and the particular character of the lesion developed depend primarily upon endogenous and exogenous conditioning.

In rats bearing a granuloma pouch, systemic stress can either inhibit or aggravate the topical damage caused by exposure of a limited tissue area to a pathogen (for example, croton oil). The result is determined by the intensity of both the topical irritation and the systemic stress. Both the protective and the aggravating effects depend upon endogenous adrenal hormones, since they are abolished by adrenalectomy. These effects may be delayed and become manifest only long after the systemic stressor has ceased to act.

A review of the stress concept leads to the conclusion that "diseases may be as much a result of the adaptive reactions of the host as they are of the damaging effects of pathogenic agents, and it is widely accepted that the relationships of people to the other people around them and to the society in which they live are important causes of disease. The 'stress concept' has contributed to this change in point of view."

DISEASES OF ADAPTATION IN ANIMALS

(See also Experimental Diseases of Adaptation, which are discussed after the corresponding spontaneous maladies of man.)

Generalities

The fact that stress can be the decisive factor in the development of various diseases—not only in experimental animals, in which such maladies are purposely induced to serve as models, but also in spontaneous diseases of domestic animals—has attracted considerable attention on the part of veterinarians. The numerous reviews dealing with this subject in different languages have generally led to the conclusion that stress can cause essentially the same diseases in animals as in man. Among these, gastrointestinal derangements, cardiovascular diseases, loss of weight, growth retardation, and a special predisposition to various infections are the most common.

Shipping Fever

Shipping fever is among the diseases of farm animals most commonly ascribed to stress. It has no obvious counterpart in man but may be regarded as a variant of the disease proneness, and particularly the predisposition to infections, that is often caused by travel in search of diversion or work. Its symptomatology varies but it is usually

accompanied by a rise in temperature and gastrointestinal disturbances, presumably elicited by a decrease in resistance to various microorganisms, particularly *Pasteurella*, PPLO and *Salmonella*.

Shipping fever is most common among cattle and other large farm animals when they are transported by rail or truck over long distances. Irregular feeding, watering, unusual weather conditions, overcrowding and exposure to pathogens not previously encountered can all act as predisposing factors. Shipping fever in cattle is of enormous economic importance, especially in North America, where it takes a very large toll among cattle and beef transported from the range to the slaughterhouse or market. The outcome is often fatal, but even among surviving animals the loss of weight is usually of sufficient magnitude to reduce their market value considerably.

When the causative microorganism is known, specific treatment with antibiotics or antiserums is recommended, but usually such therapy comes too late, and since the nature of the pathogens cannot be predicted, no generally effective prophylaxis has yet been developed.

Decreased resistance to infection is probably the most important factor in shipping fever. This has been demonstrated experimentally in pigs taken for a "joy-ride" through the countryside in a clean truck; even under such hygienic conditions, *Salmonella* organisms readily proliferated. The fact that plasma corticoid levels are elevated during shipping fever is not of particular significance, since the malady obviously causes stress, and the hormonal disturbance may be a symptom rather than the cause of the disease.

C45,578/55

Cattle exposed to the stress of shipping become particularly sensitive to infections by *Pasteurella haemolytica* and PPLO.

King, N. B., Gale, C., Smith, H. R., Hamdy, A. H., Sanger, V. L., Pounden, W. D., Klosterman, E. W.: "Stress factors in shipping fever." *Vet. Med.* **53**: 67-72 (1958). D70,196/58

"Probably the most striking feature of the description of shipping fever is the severe stress to which cattle are subjected, after leaving the range. Some of the so-called stress factors are weaning, irregular feeding and watering, exposure to unusual weather conditions, overcrowding, exposure to pathogens, and contaminated quarters during transit, et cetera." Hemorrhagic septicemia antiserum was of little value in this study, whereas certain antibiotics given prophylactically and again after arrival at destination proved to be beneficial. Presumably the stress of shipping sensitizes to infections.

V. TREATMENT

Generalities

(See also Drugs, and Multiple Stressors [Chapter II], and Diseases of Adaptation [Experimental, and in Animals, Chapter IV])

Since the treatment of individual diseases of adaptation has been discussed in the sections devoted to each of these maladies, I will now deal only with therapeutic measures applicable to any stress-induced derangement, that is, procedures meant to combat distress itself, irrespective of its cause.

Among these recommendations, the counsel most commonly given is to relax and refrain from any but the most unavoidable activities, or to seek diversion in leisure and play. However, this kind of advice is more easily given than followed, because active people are particularly dependent upon finding outlets for their pent-up energy, and cannot relax or play without continuously suffering from the feeling that they are wasting their time. For persons with an irrepressible drive to seek stress, it is much easier to find some comparatively unexacting diversionary activity than to do nothing. But because the so-called "leisure occupations" tend to become highly goal-oriented and intense efforts at outstanding achievement in sports, social, educational and civic events, they represent a poor antidote to the emotional stressors of daily work. This problem is particularly important for those who approach or have reached the retirement age and simply cannot go on utilizing their energy in the way to which they have become accustomed. As the progress of technology increasingly shortens work hours for most standard occupations, semiretirement will start as soon as a career begins. Not everyone knows how to play or to occupy additional leisure time with the more passive enjoyment of music, painting, sculpture, travel or spectator sports; hence, many people seek to release their pent-up energy through such dangerous outlets as drugs, violence and other forms of destructive behavior.

As explained in the General Outline, people also need a satisfactory motivation; for this I propose the principle of "altruistic egoism." Purely passive enjoyments (including even the pleasures of the flesh) are not sufficiently altruistic to furnish an aim that is satisfactory as the final purpose of our life. However, to discuss the entire philosophy of "altruistic egoism" would exceed the scope of this treatise; and hence I will limit myself here to simpler forms of dealing with individual problems of distress.

Among the procedures used to protect against the damaging effects of distress, some are activities employed by the individual as a means of diversion from daily routine, while others are more formal techniques or therapies. Most important among these kinds of treatment are:

Rest and Leisure
Psychotherapy in General
Handling and Gentling
Transcendental Meditation (TM) and Related Techniques—including the "relaxation response"
Zen and Yoga—including biofeedback
Hypnosis
Psychoanalysis
Acupuncture and Moxibustion
Chiropractic
Osteopathy
Various Stressors (Mental, Physical)—including balneotherapy, shortwave therapy, physiotherapy.
Diet—including "snacking behavior" which, like smoking, chewing gum and drugs is often used as a means of diversion.
Hormones and Related Substances
Vitamins
Psychotropic Drugs in General—including tranquilizers, analgesics, anesthetics, CNS stimulants.
Autonomic Blocking Agents
Ginseng, Eleutherococcus
Ethanol
Other Drugs
Smoking, which comprises ritualistic, behavioral and pharmacologic elements.

It would be impossible to present in this section a meaningful summary of all the psychotherapeutic and physical therapy procedures listed above, so for this the reader must be referred to the individual abstract sections. Essentially the same can be said about the various dietary, hormonal and other chemotherapeutic procedures.

Treatment with stress hormones, particularly catecholamines, ACTH and corticoids, is spectacularly effective against the stress produced by certain agents, but even here it is difficult to speak of nonspecific therapy for stress as such, except when an actual deficiency of these hormones has led to a general decrease in stress resistance, which may be rectified by exogenous administration of the same natural substances. Of course, in some instances the nonspecificity of such therapy is quite far-reaching. For example, in the case of the syntoxic glucocorticoids, beneficial results can be obtained against virtually any stressor that acts indirectly by eliciting excessive defense reactions (inflammation, immune responses), if these can be suppressed through steroids favoring coexistence with such indirect pathogens.

It may also be said that no single drug has been found that exerts a reliable, non-specific antistress effect irrespective of the pathogenic stressor agent.

There is some evidence that reserpine, chlorpromazine, nicotinic acid and various other drugs, especially tranquilizers, adrenergic or cholinergic blocking agents, anti-serotonins, and so on act as antistressors, possibly through their ability to block certain links in the mechanism mediating the stress response. However, in interpreting these results, the utmost care is recommended, as it is easy to confuse true anti-stress effects with the selective elimination of one or the other stress manifestation. For example, it appears quite unjustified to speak of an antistress effect merely because a drug specifically protects against stress-induced peptic ulcers or insomnia.

It is advisable to prescribe tranquilizers to patients who suffer mainly from certain psychogenic stressors, to give vasopressors to counteract the stress caused by vascular failure during shock and to administer antihistaminics when allergic-immunologic and other phenomena can be attributed to an excess of histamine. Even consumption of alcoholic beverages or tobacco smoking has a relaxing effect upon certain patients who suffer mainly from excessive nervous excitation. Yet in none of these instances are we justified in viewing the therapy as directed against the basic mechanism of stress itself.

In recent years, the Eastern remedies of ginseng and eleutherococcus (extracted from certain Asiatic plants and long used in Eastern medicine) have received a great deal of attention. There are many clinical and a few experimental observations suggesting that such preparations exert a nonspecific antistress effect, but much additional work will be necessary before these claims are widely accepted.

Treatment in General

Reflections on the importance of preparing patients for impending stress (surgical operations, aggravation of disease) to help the subsequent coping process.

Gibson, H. B.: "Morita therapy and behavior therapy." *Behav. Res. Ther.* **12**: 347-353 (1974).

J18,663/74

Description of the ancient Japanese Morita therapy for neurotic disorders, the cause of which could now be ascribed to stress. "Although the theoretical model proposed by Selye (1952) is mainly applicable to the psychosomatic disorders, it is some such feed-back loop as this which is envisaged by the Morita theorists when they discuss 'psychic interaction.'"

Vernon, D. T. A., Bigelow, D. A.: "Effect of information about a potentially stressful situation on responses to stress impact." *J. Pers. Soc. Psychol.* **29**: 50-59 (1974).

J21,561/74

"Janis's explanation for the ameliorative effect of information on stress impact was tested in a study of 80 hernia-repair patients. It was proposed that subjects receiving accurate information regarding the impending surgery, etc., experience heightened anticipatory fear, develop specific problem-oriented ideas about the operation, profess greater confidence in the medical staff, and consequently manifest less postoperative depression and hostility." The concept was only partially confirmed.

Handling and Gentling

(See also our earlier stress monographs, p. xiii)

Weininger, O.: "Mortality of albino rats under stress as a function of early handling." *Can. J. Psychol.* **7**: 111-114 (1953).

B93,807/53

None of the rats gentled ten minutes daily for about ten days after weaning died in adulthood when exposed to a complex stress situation (cold, starvation, and water deprivation), but the same stressor procedure applied at the same time in adulthood to non-gentled controls caused adrenal enlargement, bleeding gastric erosions and other manifestations of the alarm reaction, as well as a high mortality rate.

Newton, G., Heimstra, N.: "Effects of early experience on the response to whole-body X-irradiation." *Can. J. Psychol.* **14**: 111-120 (1960).

D84,835/60

Weanling rats that have been previously handled lose less weight following x-irradiation than do controls.

McMichael, R. E.: "The effects of pre-weaning shock and gentling on later resistance to stress." *J. Comp. Physiol. Psychol.* **54**: 416-421 (1961).

G46,161/61

Rats handled during the early postnatal period grew better than controls, and their resistance to stressors was not very markedly influenced in later life.

Bell, R. W., Reisner, G., Linn, T.: "Recovery from electroconvulsive shock as a function of infantile stimulation." *Science* **133**: 1428 (1961).

J22,946/61

Rats handled during the first days of life show a stress reaction from which they recover within twenty-four hours. However, if exposed to electroshock days later, they manifest a subnormal concentration of blood sugar.

Schaefer, T. Jr.: "Early 'experience' and its effects on later behavioral processes in rats: II. A critical factor in the early handling phenomenon." *Trans. N.Y. Acad. Sci.* **25**: 871-889 (1963).

J23,586/63

Handling is effective in reducing later emotionality in the life of a rat, but only if applied very early. This study implies that "handling is ineffective unless it is accompanied by a temperature change." In fact, lowering the ambient temperature at the same early period of life produces an equal effect.

Hutchings, D. E.: "Early 'experience' and its effects on later behavioral processes in rats: III. Effects of infantile handling and body temperature reduction on later emotionality." *Trans. N.Y. Acad. Sci.* **25**: 890-901 (1963).

J23,587/63

Confirmatory evidence that handling during the immediate postnatal period decreases emotionality in rats only because of the associated drop in temperature.

Hunt, H. F., Otis, L. S.: "Early 'experience' and its effects on later behavioral processes in rats: I. Initial experiments." *Trans. N.Y. Acad. Sci.* **25**: 858-870 (1963).

J23,588/63

Salama, A. A., Hunt, J. M.: "'Fixation' in the rat as a function of infantile shocking,

handling, and gentling." *J. Genet. Psychol.* **105**: 131-162 (1964) (82 refs.).
J23,019/64

Levine, S.: "Maternal and environmental influences on the adrenocortical response to stress in weanling rats." *Science* **156**: 258-260 (1967). F82,015/67

Adrenocortical steroids in the plasma of newborn rats were reduced at weaning after the pups "were exposed to novel stimuli as compared with controls that were not handled."

Denenberg, V. H., Brumaghim, J. T., Haltmeyer, G. C., Zarrow, M. X.: "Increased adrenocortical activity in the neonatal rat following handling." *Endocrinology* **81**: 1047-1052 (1967). F89,864/67

Handling two-day-old rats increased their plasma corticosterone levels within half an hour of returning them to their mothers. However, this response could be prevented if the pups were placed in handling cans maintained at 35.5°C.

Ader, R., Friedman, S. B., Grota, L. J., Schaefer, A.: "Attenuation of the plasma corticosterone response to handling and electric shock stimulation in the infant rat." *Physiol. Behav.* **3**: 327-331 (1968).

H5,148/68

In newborn rats, stressor-induced elevations of plasma corticosterone were first seen at fifteen days, at which time the response to handling and electric shock was similar. Twenty-one-day-old unmanipulated rats showed a greater reaction to electric shock than to handling. Previously shocked animals displayed little adaptation, whereas repeated handling diminished the plasma corticosterone response.

Ader, R.: "Adrenocortical function and the measurement of 'emotionality'." *Ann. N.Y. Acad. Sci.* **159**: 791-805 (1969).

H18,024/69

Plasma and adrenal corticosterone measurements in rats failed to reveal any relationship to "emotionality," appraised by the response to handling and by open field activity.

Takahashi, K., Daughaday, W. H., Kipnis, D. M.: "Regulation of immunoreactive growth hormone secretion in male rats." *Endocrinology* **88**: 909-917 (1971).

H37,347/71

In gentled rats, plasma immunoreactive STH rose more than in nongentled controls,

whereas plasma corticosterone levels were less elevated. In both gentled and nongentled rats, pentobarbital anesthesia caused a significant rise in plasma STH and a corresponding decrease in plasma corticosterone. Ether, hypertonic glucose, 2-deoxyglucose, insulin and EP caused a marked suppression of plasma STH and an increase in plasma corticosterone which were partly or totally blocked by pentobarbital anesthesia.

Zarrow, M. X., Campbell, P. S., Denenberg, V. H.: "Handling in infancy: increased levels of the hypothalamic corticotropin releasing factor (CRF) following exposure to a novel situation." *Proc. Soc. Exp. Biol. Med.* **141**: 356-358 (1972). H60,966/72

Observations on rats confirmed "previous findings that handled animals release less corticosterone than nonhandled animals when exposed to a novel environment... A functionally different mechanism for release of CRF may exist as a result of infantile stimulation."

Benson, H., Beary, J. F., Carol, M. P.: "The relaxation response." *Psychiatry* 37: 37-46 (1974). J10,474/74

Various self-induced states of altered consciousness (Transcendental Meditation, Zen, Subud, Nichiren Sho Shu, Hare Krishna, Scientology, Black Muslimism, Meher Baba and other religious practices consisting of sitting quietly and inhaling through the nose, then exhaling through the mouth) are reviewed as potential antistress measures. "Subjective and objective data exist which support the hypothesis that an integrated central nervous system reaction, the 'relaxation response,' underlies this altered state of consciousness." When elicited for periods of twenty to thirty minutes once or twice daily, these states do not appear to have any adverse effect. However, "when elicited more frequently, some subjects experience a withdrawal from life and symptoms which range in severity from insomnia to psychotic manifestations, often with hallucinatory behavior."

Benson, H.: "Your innate asset for combating stress." *Harv. Business Rev.* July-August, 1974, pp. 49-60. J14,229/74

Detailed description of the "relaxation response" as a prophylactic measure, especially against the stress of modern executive life. It is based on a combination of relaxation in a quiet environment, taking up a passive attitude in a comfortable position, and repeating silently, or in a low gentle tone, a single-syllable sound or word (for example, "one," "God"). The technique is closely related to Transcendental Meditation, Zen, yoga, autogenic training, progressive relaxation, hypnosis with suggested relaxation, and sientic cycles, with which its effects upon oxygen consumption, respiratory rate, heart rate, α -waves, blood pressure and muscle tension are compared. Its elements have been known for centuries, usually as religious rituals, but they are presented here in a noncultic factual manner and described in a language easily acceptable to the modern executive. The technique is recommended for the alleviation of certain toxicomanias, including alcoholism and cigarette smoking, and such diseases of adaptation as hypertension, peptic ulcers and some mental disturbances. It is suggested

that the relaxation response be induced once or twice daily for about twenty or thirty minutes. "When the response is elicited more frequently—for example, for many hours daily over a period of several days—some individuals have experienced a withdrawal from life and have developed symptoms which range from insomnia to hallucinatory behavior. These side effects of excessive elicitation of the relaxation response are difficult to evaluate on a retrospective basis, since many people with preexisting psychiatric problems might be drawn to any technique which evangelistically promises relief from tension and stress. However, it is unlikely that the twice daily elicitation of the response would do any more harm than would regular prayer." [The damaging side effects of overdoing this practice are singularly reminiscent of those known to be characteristic of prolonged sensory deprivation. In terms of our concept, this means that man needs stress and should use his faculties to the maximum of their tolerance for eustress, but brief periods of complete relaxation are as indispensable as sleep (H.S.).]

Eliot, R. S.: *Stress and the Heart*, Vol. 1, p. 415. Contemporary Problems of Cardiology. Mount Kisco, N.Y.: Futura, 1974.

E10,556/74

Monograph containing articles by numerous experts on the role of stress in the production of cardiovascular disease, with special reference to hypertension and myocardial infarction. Among the factors involved in the cardiovascular effects of stress, individual chapters deal with the role of occupation, homeostasis, sex, environmental influences, athletics, emotional arousal and stress tests. The therapeutic value of various techniques for relaxation, including Transcendental Meditation, yoga, Zen, sentic cycles, hypnosis and related practices, is examined.

Benson, H., Rosner, B. A., Marzetta, B. R., Klemchuk, H. M.: "Decreased blood-pressure in pharmacologically treated hypertensive patients who regularly elicited the relaxation response." *Lancet* February 23, 1974, pp. 289-291. J14,532/74

Induction of a wakeful hypometabolic state by simple, noncultic mental techniques or by traditional meditational practices. It appears to derive from a hypothalamic response that decreases sympathetic activity and diminishes the blood pressure of moderately hypertensive patients. The results are

similar to those obtained by Transcendental Meditation.

Schneider, M.-J.: "Measuring meditation." *Sciences* 14: 6-10 (1974).

H86,769/74

Brief semipopular résumé of somatic changes achieved by Transcendental Meditation and yoga. The EEG was typical of relaxed wakefulness and not comparable to sleep, coma or hibernation. The blood concentrations of lactic acid, as well as the BMR were diminished. "Indian Yogis do it to reach nirvana. Japanese monks do it seeking satori. In the middle ages, Christian mystics did it to achieve union with God. More than 375,000 Americans have learned to meditate since 1965 in the hope of becoming less tense, more efficient and creative."

H84,213/74

Beary, J. F., Benson, H.: "A simple psychophysiologic technique which elicits the hypometabolic changes of the relaxation response." *Psychosom. Med.* 36: 115-120 (1974).

J18,917/74

"Oxygen consumption, carbon dioxide production, and respiratory rate are significantly decreased during the practice of a new, easily-learned relaxation technique. The elements of the technique are a mental device to prevent distracting thoughts, a passive attitude, decreased muscle tonus, and a quiet environment which is as free of visual and auditory stimuli as possible. Sitting quietly with the eyes either open or closed failed to produce the same changes. These physiologic changes are consistent with an integrated hypothalamic response resulting in hypothesized decreased sympathetic activity." The procedure has been termed "relaxation response" and is closely related to TM (28 refs.).

J21,210/71

Hypnotic techniques utilize ordinary suggestion to control inappropriate behavior without induction of formal hypnosis. "They are uniquely suitable for any patient's needs in any type of temporary stress."

Fogel, S.: "Muscular spasm diseases and body image distortions." *Am. J. Clin. Hypn.* **14**: 16-23 (1971).

G85,833/71

General discussion of hypnosis as a treat-

ment for stress-induced psychosomatic disease, illustrated with several case reports.

Cobb, L. A., Ripley, H. S., Jones, J. W.: "Free fatty acid mobilization during suggestion of exercise and stress using hypnosis and sodium amytal." *Psychosom. Med.* **35** No. 5: 367-374 (1973).

J7,261/73

"During hypnosis four of the six subjects readily relived past experiences of strenuous exercise and had significant increases in arterial FFA levels, and three showed rises in heart rate. In three of these four subjects there were further FFA increments with the reliving of past emotionally stressful situations." On the basis of observations with β -adrenergic blocking agents, the authors believe that "mechanisms other than circulating catecholamines, most likely neural adrenergic discharge, are also responsible for the FFA mobilization. A similar neurogenic mobilization of FFA may occur to some extent during physical exertion."

Psychoanalysis

(See also our earlier stress monographs, p. xiii)

Simple textbook on psychosomatic medicine in relation to psychoanalysis and the G.A.S. (260 refs.).

Hartmann, H.: "Ego psychology and the problem of adaptation." In: Rapaport, D., *Organization and Pathology of Thought*, pp. 362-396. New York: Columbia University Press, 1951.

G27,004/51

Extensive analysis of the psychoanalytic approach to problems of psychologic adaptation, with almost no consideration of somatic stress (several hundred refs.).

Menninger, K.: "Regulatory devices of the ego under major stress." *Int. J. Psychoanal.* **35**: 412-420 (1962).

J3,936/62

Psychoanalytic study of the stress syndrome as a mental homeostatic reaction. It is concluded that "in its effort to control dangerous impulses under such circumstances and thereby prevent or retard the disintegrative process which threatens, the ego initi-

ates emergency regulatory devices which fall into five hierarchically arranged and specifically characterized groups, representing increasingly greater degrees of failure in integration."

Silverman, S.: *Psychologic Cues in Forecasting Physical Illness*, p. 403. New York: Appleton-Century-Crofts, 1970.

E10,672/70

Monograph on psychosomatic diseases, particularly stress-induced derangements, based largely on psychoanalytic investigations. The more of the following characteristics that appear together in a person, the greater the probability of the occurrence of somatic disease: "(1) exposure to critical psychologic stress inadequately compensated for by other environmental factors of a favorable nature; (2) some degree of physical dysfunction (ranging up to major illness) as part of a general style of adaptation to psychologic stress in the past, with previously sensitized body areas representing potential current target organs; (3) evidence of increasing instability and regressive shifts in psychologic equilibrium; (4) blocking of affects from adequate emotional expression or insufficient awareness of their significance if they are being so discharged; (5) presence of denial as a prominent psychologic defense; (6) existence of a high degree of egosuperego tensions despite lessening psychologic manifestations of their presence; (7) build-up of unmodified aggressiveness which is internalized; (8) a persisting increase in awareness of physical sensations and perceptions compared with previous levels; (9) recurrent dreams (and parapraxia) whose latent content contains prominent physical references especially to some form of dysfunction; (10) verbal references to somatic identification with an emotionally significant object, reinforced by actual occurrence of similar or related organ dysfunction in that person."

McLean, A.: "A psychoanalytic framework." In: McLean, A., *Occupational Stress*, pp. 27-30. Springfield, Ill.: Charles C Thomas, 1974.

Diet

(See also our earlier stress monographs, p. xiii)

Vasiutochkin, V. M.: "Physio-biochemical principles of rational nutrition in states of neuro-physical tension." *Vopr. Med. Zh.* No. 7: 50-56 (1959) (Russian).

J24,379/59

Allison, J. B.: "Stress diseases in relation to nutrition." *Rev. Invest. Clin.* **14**: 139-154 (1962). D29,232/62

Protein malnutrition, tumor growth and hypertension cause hyperlipemia in the dog and rat. They are considered to be stress diseases treatable by adequate protein intake.

Cuthbertson, D. P.: "Physical injury and its effects on protein metabolism. In: Munro, H. N. and Allison, J. B., *Mammalian Protein Metabolism*, pp. 373-414. New York and London: Academic Press, 1964.

G79,175/64

Review on the effect of stress upon protein metabolism. In man, protein loss within ten days of physical injury may amount to about 12 percent of the total body protein. In general, there is a catabolic loss during the first ten days and a maximum at about the third day with a secondary peak on the eighth day. With regard to dietary treatment, most observers hold that "during the first few days following the injury in the previously adequately nourished person it is probably unwise to push the intake of a well-balanced diet beyond appetite as this may fail during this early postinjury phase in severe injuries. Further, kidney function may not be normal for a day or two. Thereafter the patient should be encouraged, but not forced, to take as much as he can of a well-balanced diet, relatively rich in protein."

Balsley, M., Brink, M. F., Speckmann, E. W.: "Nutrition in disease and stress." *Geriatrics* **26**: 87-93 (1971). H36,185/71

Carlo, P. E.: "Nutritional therapy in surgery and trauma. Metabolic consequences of nutritional restriction and stress." *Agrestologie* **12**: 303-324 (1971). H51,864/71

Review on nutritional therapy for the metabolic consequences of trauma and other forms of stress. The so-called "obligatory, post-traumatic nitrogen loss" is part of the G.A.S. facilitated by, but not entirely dependent upon glucocorticoids. In acute stress, gluconeogenesis becomes essential at the expense of proteins to furnish a rapidly available source of energy. Lysosomes supply the enzymes required to catabolize proteins or synthesize sugar. Glucagon probably plays a very important role in this process, as it stimulates lysosomal activity and decreases insulin, thereby combatting stress-induced posttraumatic insulin resistance, since insulin inhibits gluconeogenesis. The main pertinent questions are answered as follows: "a) post-

traumatic nitrogen loss is due to starvation and stress; b) it is harmful because of the protein loss and metabolic imbalances it induces; c) it can be prevented or considerably limited by preventing the development of intense gluconeogenesis before surgery, and pharmacological control of adrenergic reactions; d) it helps the patient because it decreases the chances and severity of complications and speeds up recovery." In severe surgical stress, parenteral nutrition is advocated.

King, A. J.: "Stress, cigarette smoking and snacking behaviour in adolescent males." *Can. J. Public Health* **62**: 297-302 (1971). G86,388/71

Among male adolescents, stress (caused by examinations) produced more significant changes in snacking than in smoking. "Stressed non-smokers snacked significantly more than unstressed non-smokers. Unstressed smokers snacked significantly more than unstressed non-smokers."

Hartig, W.: "Ernährung des Patienten im Stress" (Diet of the patient in stress). *Zentralbl. Chir.* **99**: 577-586 (1974).

J14,052/74

Clinical suggestions concerning diets for patients under stress (28 refs.).

Hormones and Related Substances

(See also our earlier stress monographs, p. xiii)

Selye, H., Dosne, C.: "Treatment of wound shock with corticosterone." *Lancet* July 20, 1940, pp. 70-71. A33,299/40

In rats the damaging effect of stressors (surgical trauma, formaldehyde) can be combatted by corticosterone but not by DOC. "From this it appears that the hydroxyl group on carbon atom 11 is important for the shock-combating action of cortical steroids."

Selye, H., Dosne, C., Bassett, L., Whitaker, J.: "On the therapeutic value of adrenal cortical hormones in traumatic shock and allied conditions." *Can. Med. Assoc. J.* **43**: 1-8 (1940). A32,768/40

During the shock phase of the alarm reaction produced by heavy formaldehyde dosage in the rat, there is hypochloremia, hypoglycemia and hemoconcentration, all of which can be at least partially inhibited by a crude cortical extract (cortin). This is

even more obvious in surgical shock produced by partial hepatectomy, but here a specific effect of hepatic insufficiency cannot be excluded.

Harrower, H. R.: "The adrenal glands in stress, toxemia and infections." *Med. Rec. (N.Y.)* **155**: 497-501 (1942).

B26,260/42

Review of clinical data suggesting that the most diverse diseases "may have adrenal-depleting effects. There now can be no doubt that minor degrees of adrenal insufficiency are far more common, far more responsive to treatment (and, therefore, far more important to the average physician) than major degrees of adrenal insufficiency such as Addison's disease." Hence, corticoid therapy is recommended for the first time as a treatment in quite disparate maladies.

Pincus, G., Hoagland, H.: "Effects of administered pregnenolone on fatiguing psychomotor performance." *J. Aviat. Med.* **15**: 98-115 (1944).

B11,448/44

Pregnenolone improved stress resistance as indicated by performance scores on the Stevens serial coordination meter and the Hoagland-Werthessen pursuit meter. No such effects were obtained under similar conditions by placebos, progesterone or adrenocortical extracts. [We have found no evidence that these promising results have ever been confirmed (H.S.).]

Sprague, R. G.: Cortisone and ACTH. A review of certain physiologic effects and their clinical implications." *Am. J. Med.* **10**: 567-594 (1951).

B58,575/51

Levine, R., Goldstein, M. S., Ramey, E. R., Fritz, I.: "Studies on the mode of action of cortisone in stress situations." *Bull. N. Engl. Med. Cent.* **13**: 114-120 (1951).

B65,214/51

Studies on the Chambers-Zweifach mesoappendix preparation suggest that the beneficial effect of adrenocortical extract in stress is due largely to its action upon vascular contractility.

Duncan, J. T. Jr.: "Adrenal insufficiency in thermal burn with septicemia. Successful replacement therapy." *Am. Surg.* **20**: 57-59 (1954).

J10,792/54

In a patient with adrenal insufficiency following a burn and septicemia, cortisone was very efficacious.

Scholz, H.: "Die Behandlung des Bestrahlungssyndroms mit Prednisolon" (Treatment

of the radiation syndrome with prednisolone). *Zentralbl. Gynaekol.* **81**: 1065-1075 (1959).

C78,296/59

Review of the literature and personal observations suggest that the radiation syndrome is essentially related to the G.A.S. and associated with adrenocortical deficiency. Prednisolone allegedly has a therapeutic effect on both the generalized radiation syndrome and on local x-ray damage.

Hall, C. E., Hall, O.: "Effect of stress on response to fluorocortisone excess in the rat." *Proc. Soc. Exp. Biol. Med.* **107**: 799-802 (1961).

E99,293/61

Hale, H. B., Mefferd, R. B. Jr.: "Effects of somatotropin in rats acutely exposed to adverse environments." *J. Appl. Physiol.* **16**: 123-126 (1961).

D191/61

In rats, "somatotropin modified environmentally induced changes in 24-hour urinary excretion of urea, uric acid and phosphate and the urinary Na/K, Ca/P and uric acid/creatinine ratios. Suggestive evidence was thus obtained to support the hypothesis that somatotropin contributes to homeostasis."

Zambarda, E.: "Urinary excretion of corticoids in patients undergoing minor surgical stress and treated with aldosterone." *Riv. Patol. Clin.* **18**: 833-836 (1963).

J24,639/63

Sambhi, M. P., Weil, M. H., Udhaji, V. N., Shubin, H.: "Adrenocorticoids in the management of shock." In: Hershey, S. G., *Shock*, Vol. 2, pp. 421-433. Boston: Little, Brown, 1964.

G68,985/64

Review of the literature on the limited use of glucocorticoids in the management of shock (50 refs.).

Livanou, T., Ferriman, D., James, V. H. T.: "The response to stress after corticosteroid therapy." *Proc. R. Soc. Med.* **58**: 1013-1015 (1965).

F59,005/65

In patients, shortly after discontinuing glucocorticoid therapy, the plasma cortisol level following insulin hypoglycemia does not increase as much as in unpretreated controls.

Dobkin, A. B., Byles, P. H., Neville, J. F. Jr.: "Neuroendocrine and metabolic effects of general anaesthesia and graded haemorrhage." *Can. Anaesth. Soc. J.* **13**: 453-475 (1966).

G41,075/66

In dogs, various parameters of the stress reaction were compared following anesthesia induced by different agents, in combination with severe bleeding, and after pretreatment

with methylprednisolone and ampicillin. Individual responses varied, depending upon the anesthetic used: "It is likely that the rapid recovery from the stress of the combination of haemorrhage and general anaesthesia may be attributed to the use of a relatively large dose of the corticoid and antibiotic drugs." [Lack of adequate controls makes it difficult to identify the relative role of each factor in this complicated procedure (H.S.).]

VanderWall, D. A., Stowe, N. T., Spangenberg, R., Hook, J. B.: "Effect of glucagon in hemorrhagic shock." *J. Surg. Oncol.* **2**: 177-187 (1970). G77,407/70

In dogs, some of the circulatory disturbances elicited by hemorrhagic shock were prevented by chronic intravenous infusions of glucagon. Hence, "glucagon has potential usefulness in clinical situations in which cardiac output and renal blood flow are compromised."

Kostowski, W., Rewerski, W., Piechocki, T.: "Effects of some steroids on aggressive behaviour in mice and rats." *Neuroendocrinology* **6**: 311-318 (1970). H34,036/70

DOC decreased the muricide reaction in rats, but failed to change the aggressive response of isolated mice. Cortisol increased aggressiveness, whereas hydroxydione (an anesthetic steroid) decreased it in both these tests.

Madden, J. J. Jr., Ludewig, R. M., Wangensteen, S. L.: "Failure of glucagon in experimental hemorrhagic shock." *Am. J. Surg.* **122**: 502-504 (1971). G86,060/71

In dogs with hemorrhagic shock, glucagon (given at the time of re-infusion of the shed blood) had no beneficial hemodynamic effect and did not increase survival rates.

Lefer, A. M., Glenn, T. M., Lopez-Rasi, A. M., Kiechel, S. F., Ferguson, W. W., Wangensteen, S. L.: "Mechanism of the lack of a beneficial response to inotropic drugs in hemorrhagic shock." *Clin. Pharmacol. Ther.* **12**: 506-516 (1971). G83,070/71

Despite its inotropic effect, glucagon did not exhibit any beneficial action in dogs with hemorrhagic shock.

Bendikov, E. A., Basaeva, A. I.: "The use of DOPA in replacement therapy in disturbances of circulatory regulation during stress." *Biull. Éksp. Biol. Med.* **76** No. 12: 36-39 (1973) (Russian). Engl. trans.: *Bull. Exp. Biol. Med.* **76**: 1414-1416 (1973). J20,146/73

In cats, stress produced by injection of potassium chloride into the lateral ventricles caused depletion of NEP in the hypothalamus, with inhibition of sympathetic vasomotor tone. These changes could be corrected by injection of DOPA.

Novelli, G. P., Marsili, M., Pieraccioli, E.: "Anti-shock action of steroids other than cortisone." *Eur. Surg. Res.* **5**: 169-174 (1973). J7,837/73

In rats, mortality induced by trauma (drum-shock) can be combatted by massive doses of glucocorticoids, estrogens and testosterone. Apparently, the therapeutic effect is not due to the specific action of glucocorticoids, but rather to overdosage with various steroids.

Kobayashi, A., Utsunomiya, T., Sentoh, H., Tomita, K., Ohbe, Y.: "Adrenocortical responsiveness after long-term corticosteroid therapy in childhood nephrosis." *Helv. Paediatr. Acta* **28**: 341-348 (1973). J8,226/73

In children who received long-term glucocorticoid treatment for nephrosis, ACTH caused a greatly diminished response in the hormone production of the adrenals following discontinuation of the therapy. Depending upon the length and dosage of treatment with betamethasone, complete recovery of adrenocortical responsiveness may take six months.

Bismuth, C.: "Utilisation des corticoïdes dans le choc toxique" (Utilization of corticoids in toxic shock). *Eur. J. Toxicol.* **6**: 168-170 (1973). J9,345/73

Brief summary of the uses and limitations of corticoid therapy for allergic shock and pneumopathies due to inhalation of gastric juice.

Bouzarth, W. F., Shenkin, H. A.: "Possible mechanisms of action of dexamethasone in brain injury." *J. Trauma* **14**: 134-136 (1974). J10,329/74

Dexamethasone may be beneficial in the treatment of brain injury by relieving the associated cerebral edema. It is dubious whether its effect upon systemic stress also plays a role here (16 refs.).

Court, J. M., Dunlop, M. E., Boulton, T. J. C.: "Effect of ephedrine in ketotic hypoglycaemia." *Arch. Dis. Child.* **49**: 63-65 (1974). J10,138/74

In children receiving a "ketogenic stress diet," it has been shown that "while adequate glycogen stores exist, ephedrine may help

maintain glucose homoeostasis under conditions of stress."

Vitamins

(See also our earlier stress monographs, p. xiii)

Dugal, L. P., Thérien, M.: "The influence of ascorbic acid on the adrenal weight during exposure to cold." *Endocrinology* **44**: 420-426 (1949). B36,429/49

In guinea pigs as in rats, exposure to cold elicits all the manifestations of the alarm reaction, including ascorbic acid depletion. Treatment with ascorbic acid inhibits adrenal enlargement and raises resistance to cold.

Stepto, R. C., Pirani, C. L., Consolazio, C. F., Bell, J. H.: "Ascorbic acid intake and the adrenal cortex." *Endocrinology* **49**: 755-773 (1951). B66,289/51

In guinea pigs kept on a vitamin C-deficient diet, adrenal ascorbic acid drops concurrently with adrenal lipids and cholesterol. This may interfere with corticoid synthesis or merely indicate that, for the guinea pig, vitamin C deficiency is a strong stressor. In such a situation, vitamin C administration is of therapeutic value.

Bacchus, H.: "Leukocyte response to stress in normal and adrenalectomized rats pretreated with ascorbic acid." *Proc. Soc. Exp. Biol. Med.* **77**: 167-169 (1951). B59,311/51

In rats, stress caused by sham adrenalectomy induces eosinopenia, with polymorphonuclear leukocytosis developing within three hours. Pretreatment with ascorbic acid or adrenalectomy prevents, and may even reverse, the eosinopenia.

Bacchus, H., Altszuler, N.: "Eosinophil response to stress in ascorbic acid pretreated mice." *Endocrinology* **51**: 1-4 (1952). B74,531/52

In mice, ascorbic acid pretreatment prevents the eosinopenia caused by EP, but not that elicited by ACTH. "These observations were interpreted as indicating that the vitamin operated in this mechanism by depressing the release of pituitary corticotrophic hormone."

Pirani, C. L.: "Review: relation of vitamin C to adrenocortical function and stress phenomena." *Metabolism* **1**: 197-222 (1952).

B70,172/52

Review of the literature which leads to the conclusion that "under normal conditions man is supplied with stores of ascorbic acid more than adequate to cope with the metabolic need of acute stress. Administration of ascorbic acid, however, would seem indicated in severe chronic stress, especially after traumatic injuries or burns, and during protracted stimulation of the adrenal cortex" (242 refs.).

Salomon, L. L.: "Studies on adrenal ascorbic acid. II. On ascorbic acid neogenesis in rat adrenal glands." *Tex. Rep. Biol. Med.* **15**: 934-939 (1957). C45,566/57

Studies with labeled vitamin C indicate that, in both hypophysectomized and intact rats, local synthesis of this vitamin contributes little or nothing to its concentration in the adrenal.

Goldstein, A., Bailey, G. W. H.: "The effect of ascorbic acid on mental and physical well-being in human subjects under mild stress." *Stanf. Med. Bull.* **17**: 175-177 (1959).

J23,580/59

In a double-blind experiment on male medical students, vitamin C, administered daily in large amounts, was "no more effective than a placebo in improving the state of mental and physical well-being, as evaluated by the subjects themselves. Ascorbic acid also had no effect on the incidence of colds among the subjects."

Juszkiewicz, T., Jones, L. M.: "Effects of chlorpromazine and ascorbic acid in rats during simulated transportation conditions at normal and high temperatures." *Am. J. Vet. Res.* **22**: 544-548 (1961). J24,117/61

"Under simulated transport conditions, chlorpromazine protects rats against excessive weight losses, excessive depletion of the adrenal ascorbic acid, and the excessive mortality experienced at high temperature. The simultaneous administration of ascorbic acid with chlorpromazine seemed to promote anti-stress effects, particularly at high temperatures."

Wiswell, O. B.: "Influence of vitamin E and high and low thermal environments on weight and body temperature of the rabbit." *Aerosp. Med.* **33**: 685-688 (1962).

J23,017/62

In rabbits exposed to cold or heat, the body weight loss ascribed to stress is diminished by vitamin E supplements to the diet.

Rokicki, W.: "On the anti-stress activity of vitamin C." *Patol. Pol.* **17**: 34-38 (1966) (Polish).

J24,613/66

Levi, L.: "Das Experiment am Menschen in der Psychosomatik" (Psychosomatic studies in man). *Verh. Dtsch. Ges. Inn. Med.* **73**: 58-70 (1967). G85,102/67

In man, various psychic stressors cause hyperlipoproteinemia as well as increased blood FFA. Nicotinic acid treatment diminishes the blood lipids without influencing the tachycardia, hypertension or catecholamine secretion. Hence, it is assumed that nicotinic acid inhibits fatty acid mobilization within the adipose tissue itself.

Green, J., Muthy, I. R., Diplock, A. T., Bunyan, J., Cawthorne, M. A., Murrell, E. A.: "Vitamin E and stress. 7. The interrelationships between polyunsaturated fatty acid stress, vitamin A and vitamin E in the rat and the chick." *Br. J. Nutr.* **21**: 845-864 (1967). F92,058/67

In rats, vitamin E has no obvious protective effect against stressors.

Carlson, L. A., Levi, L., Orö, L.: "Plasma lipids and urinary excretion of catecholamines in man during experimentally induced emotional stress, and their modification by nicotinic acid." *J. Clin. Invest.* **47**: 1795-1805 (1968). H1,440/68

In male volunteers, emotional stressors (dazzling light, standardized criticism, sorting steel balls of different sizes) caused a rise in plasma FFA and triglycerides as well as increased catecholamine excretion. Concurrent treatment with nicotinic acid prevented the elevation in FFA and triglycerides but not the stressor-induced increase in catecholamine elimination or the associated rise in heart rate and blood pressure.

Piroth, M.: "Experimenteller Stress und Ascorbinsäurezufuhr" (Experimental stress and supply of ascorbic acid). *Verh. Dtsch. Ges. Pathol.* **52**: 478-480 (1968).

H34,240/68

In rats chronically exposed to cold, the manifestations of the G.A.S. could not be beneficially influenced by vitamin C supplements, except for a doubtful increase in resistance during the first week.

Beneš, V., Hrubeš, V.: "Serum free fatty acids level after an experimentally induced emotional stress and its modification by nicotinic acid in rats with different characteristics of higher nervous activity." *Activ. Nerv. [Supp.]* (Praha) **10**: 395-399 (1968). J11,743/68

For rats in which fear was induced by intermittent electric shocks, serum FFA

rises were particularly obvious among animals with extremely low spontaneous exploratory activity. Intraperitoneal nicotinic acid completely blocked this change.

Rokicki, W.: "Effect of vitamin C on the ovaries and adrenal glands in stress states." *Patol. Pol.* **20**: 455-459 (1969) (Polish).

J24,612/69

Mikhelson, D. A.: "The effect of the B₁ vitamin and niacin on the course of biochemical processes in the organism exposed to the action of vibration." *Vopr. Pitan.* **28** No. 6: 54-58 (1969) (Russian). J25,110/69

In rats, stress induced by vibration appears to have been alleviated by thiamine and niacin, but especially by the combined administration of both vitamins.

Pohujani, S. M., Chittal, S. M., Raut, V. S., Sheth, U. K.: "Studies in stress induced changes on rat's adrenals. Part III. Effect of pre-treatment with ascorbic acid." *Indian J. Med. Res.* **57**: 1091-1094 (1969).

H43,275/69

Ellerbrook, R. C., Purdy, M. B.: "Capacity of stressed humans under mega dosages of nicotinic acid to synthesize methylated compounds." *Dis. Nerv. Syst.* **31**: 196-197 (1970). G74,382/70

"How much vitamin C?" *Nature* **243**: 117-118 (1973). H77,668/73

Review of literature suggesting that, during surgical stress, guinea pigs need many times the basic amount of vitamin C.

Khomulo, P. S., Mytareva, L. V., Zakrinichnaya, G. A.: "Oxygen and glucose utilization by aortic tissue with administration of cholesterol and nervous system stress." *Kardiologija* **13** No. 1: 116-120 (1973) (Russian). H80,123/73

In rats, vitamin B₁₅ (calcium pangamate) allegedly diminishes certain metabolic changes produced by restraint.

Rasche, R., Butterfield, W. C.: "Vitamin A pretreatment of stress ulcers in rats." *Arch. Surg.* **106**: 320-321 (1973).

J641/73

Studies on rats which received 10,000 international units of vitamin A prior to an eight-hour period of immobilization in a wire gauze device suggest that this vitamin "exerts a negligible, if any, protective effect on the occurrence of gastric ulceration."

Nandi, B. K., Subramanian, N., Majumder, A. K., Chatterjee, I. B.: "Effect of

ascorbic acid on detoxification of histamine under stress conditions." *Biochem. Pharmacol.* **23**: 643-647 (1974). H81,833/74

In both rats and guinea pigs kept on an ascorbic acid-free diet, a variety of stressors (vaccines, toxoids, malnutrition, cold, heat, pregnancy) increased histamine formation or excretion into the urine. "Administration of large doses of ascorbic acid in any of the stressful situations resulted in a marked decrease in the urinary histamine level indicating detoxification of histamine in vivo."

Cheney, C. D., Rudrud, E.: "Prophylaxis by vitamin C in starvation induced rat stomach ulceration." *Life Sci.* **14**: 2209-2214 (1974) (16 refs.). J14,496/74

Gori, E.: "Les hypnotiques et le stress" (Hypnotics and stress). *20th Int. Congr. Physiol.*, 357-358. Brussels, July-August, 1956. C23,393/56

Even fatal doses of *barbiturates* fail to produce an alarm reaction (adrenal ascorbic acid depletion) in the rat, and actually inhibit the stressor effect of various agents. On the other hand, many *hypnotics* and *anesthetics* stimulate ACTH secretion and may thereby overcome their own antistress effect, which might be due to depression of the reticular formation. [The brief abstract does not lend itself to critical analysis (H.S.).]

Mason, J. W., Brady, J. V.: "Plasma 17-hydroxycorticosteroid changes related to reserpine effects on emotional behavior." *Science* **124**: 983-984 (1956). C25,325/56

In rhesus monkeys, moderate doses of *reserpine* inhibited not only experimentally induced anxiety and fear responses, but also the associated increase in plasma 17-OHCS levels. This fact is all the more interesting since, in themselves, comparable doses of reserpine produce a transient increase in 17-OHCS levels.

Mahfouz, M., Ezz, E. A.: "The action of chlorpromazine and serpasil on the response of the rat to acute stress." *20th Int. Congr. Physiol.*, pp. 601-602. Brussels, July-August, 1956. C23,436/56

Both *chlorpromazine* and *serpasil* pretreatment "seemed to have protected" rats against the stressor effect (adrenal ascorbic acid depletion) of various agents, such as ether anesthesia, hemorrhage, heat and cold. [The brief abstract does not lend itself to critical evaluation (H.S.).]

Bias, D. A. de, Paschkis, K. E., Cantarow, A.: "Effects of *chlorpromazine* and autonomic nervous system blocking agents in combating heat stress." *Am. J. Physiol.* **193**: 553-556 (1958). C54,401/58

Brief review of the literature and personal observations on the effect of various drugs upon resistance to diverse stressors in intact and adrenalectomized rats. Since different drugs are effective against different stressors, the mechanisms of protection must be dissimilar.

Mahfouz, M., Ezz, E. A.: "The effect of reserpine and chlorpromazine on the response of the rat to acute stress." *J. Pharmacol. Exp. Ther.* **123**: 39-42 (1958). C53,654/58

In rats, both *chlorpromazine* and *reserpine*

Psychotropic Drugs in General

(See also our earlier stress monographs, p. xiii)

Holzbauer, M., Vogt, M.: "The action of chlorpromazine on diencephalic sympathetic activity and on the release of adrenocorticotrophic hormone." *Br. J. Pharmacol.* **9**: 402-407 (1954). C7,651/54

In rats, ACTH release following surgical shock or EP injection was not prevented by *chlorpromazine*. In fact, the latter caused some ACTH release by itself. These observations contradict certain earlier claims.

Nasmyth, P. A.: "The effect of *chlorpromazine* on adrenocortical activity in stress." *Br. J. Pharmacol.* **10**: 336-339 (1955).

C27,637/55

Kothari, N. J., Rindani, T. H.: "Effect of reserpine-free extract of *Rauwolfia serpentina* on stress induced activation of adrenal cortex." *Arch. Int. Pharmacodyn. Ther.* **105**: 68-72 (1956). C15,329/56

In man, the eosinopenia "in response to systemic stress by electroshock" is decreased by pretreatment with *Rauwolfia serpentina*, indicating a blockade of the stress response.

Huguenard, P.: "Atténuation du 'stress' par l'hypométabolisme (Physiologie et méthodes)" (Attenuation of "stress" by hypometabolism [physiology and methods]). *Anesth. Analg.* **13**: 16-40 (1956). C15,557/56

Summary of the results on the prevention by artificial hibernation of surgically-induced stress in man.

inhibited the stressor effect (adrenal ascorbic acid depletion) of cold, heat, and hemorrhage under ether anesthesia. Neither drug prevented the adrenal ascorbic acid depletion caused by ACTH. They may act upon the hypothalamus.

Kivalo, E., Rinne, U. K.: "The effect of *perphenazine* on the ACTH release induced by neurotropic stress." *Psychopharmacologia* **1**: 288-293 (1960). J23,393/60

Weiss, B., Laties, V. G., Blanton, F. L.: "Amphetamine toxicity in rats and mice subjected to stress." *J. Pharmacol. Exp. Ther.* **132**: 366-371 (1961). D6,968/61

The toxicity of amphetamine is increased in rats and mice exposed to aversive electroshock. This effect can be counteracted by *chlorpromazine* and *phenoxybenzamine*.

Juszkiewicz, T., Jones, L. M.: "Effects of *chlorpromazine* and ascorbic acid in rats during simulated transportation conditions at normal and high temperatures." *Am. J. Vet. Res.* **22**: 544-548 (1961). J24,117/61

"Under simulated transport conditions, *chlorpromazine* protects rats against excessive weight losses, excessive depletion of the adrenal ascorbic acid, and the excessive mortality experienced at high temperature. The simultaneous administration of ascorbic acid with *chlorpromazine* seemed to promote anti-stress effects, particularly at high temperatures."

Chaudhury, R. R., Chaudhury, M. R., Lu, F. C.: "Stress-induced block of milk ejection." *Br. J. Pharmacol.* **17**: 305-309 (1961). D61,414/61

The stress-induced block of milk ejection in guinea pigs can be largely inhibited by *tranquillizers*.

Mallov, S., Witt, P. N.: "Effect of stress and tranquilization on plasma free fatty acid levels in the rat." *J. Pharmacol. Exp. Ther.* **132**: 126-130 (1961). D3,463/61

In rats, electroshocks raise the plasma FFA concentration. This in turn can be inhibited by tranquilizers (*chlorpromazine*, *meprobamate*), but only when given at certain dose levels at critical times.

Betz, D., Ganong, W. F.: "Effect of *chlorpromazine* on pituitary-adrenal function in the dog." *Acta Endocrinol. (Kbh.)* **43**: 264-270 (1963). D68,211/63

Petri, G., Kovács, G. S.: "The effect of operation stress on the metabolism of

patients." *Pol. Tyg. Lek.* **18**: 674-680 (1963) (Polish). G2,166/63

"It has been found that in response to surgery urine flow promptly decreased, osmolality increased; infusion of 5 per cent dextrose did not influence this phenomenon. The urinary output of sodium and chloride fell promptly after operation, potassium excretion increased. . . . *Barbiturate* anaesthesia prevented the development of postoperative metabolic changes as long as anaesthesia was maintained but once it was over, the above changes developed in their characteristic form."

Girod, C.: "Influence de la réserpine sur l'axe hypophysocortico-surrénalien, chez le singe *Macacus sylvanus L.*" (The influence of reserpine on the pituitary-adrenocortical axis in the *Macacus sylvanus L.* monkey). *C.R. Acad. Sci. (Paris)* **256**: 1600-1602 (1963). D62,899/63

In the monkey *Macacus sylvanus L.*, *reserpine* causes adrenal hyperactivity with pituitary changes suggestive of increased ACTH secretion.

Buckley, J. P., Kato, H., Kinnard, W. J., Aceto, M. D. G., Estevez, J. M.: "Effects of reserpine and *chlorpromazine* on rats subjected to experimental stress." *Psychopharmacologia* **6**: 87-95 (1964). G19,794/64

In rats, combined treatment with various stressors (sound, light, vibration, conditioned avoidance) elicited peak pressor responses after eleven weeks. This was not influenced by *reserpine* or *chlorpromazine*, which actually increased mortality. Possibly, under certain conditions (prolonged chronic stress rather than severe acute stress), both reserpine and *chlorpromazine* exert a potentiating or additive effect on the pituitary-adrenal response to stress, "thus producing adrenal insufficiency leading to the death of the animal."

Tullner, W. W., Hertz, R.: "Suppression of corticosteroid production in the dog by monase." *Proc. Soc. Exp. Biol. Med.* **116**: 837-840 (1964). F17,084/64

Etryptamine (Monase), formerly used as an antidepressant, often causes syncope and hypotension in patients, and sharply decreases corticoid output in pentobarbital-anesthetized dogs. This effect is prevented by ACTH, even after hypophysectomy. Presumably, the action of *etryptamine* "in intact dogs is a result of suppression either of formation or release of ACTH."

Bernis, R., Vanek, R., Delferiere, A., Trop, D.: "Etude clinique et biochimique de l'anesthésie à l'hydroxydione dans l'agression chirurgicale" (Clinical and biochemical study of anesthesia with hydroxydione in surgical stress). *Acta Anaesthesiol. Belg.* **15**: 97-110 (1964). J24,074/64

In man, *hydroxydione* anesthesia does not prevent the increase in corticoid output produced by surgery.

Bohus, B., Endrőczi, E.: "Untersuchungen über die Wirkung von Chlorpromazin auf das Hypophysen-Nebennierenrinden-System bei Ratten" (Studies on the effect of chlorpromazine on the hypophysis-adrenal cortex system in rats). *Endocrinologie* **46**: 126-133 (1964). F16,012/64

In rats, large doses of subcutaneous *chlorpromazine*, particularly when injected into the reticular formation of the brain, produced high corticosterone secretion. It was not possible to inhibit the blood corticosterone rise normally caused by stressors (formalin, restraint) through pretreatment with chlorpromazine.

Rerup, C.: "Corticotrophin release in mice: failure of pentobarbital-morphine to block the effect of non-specific stress." *Acta Endocrinol. (Kbh.)* **46**: 387-392 (1964). F14,817/64

In mice, the nonspecific stress of histamine injections could not be blocked by *pentobarbital* plus *morpheine*; hence, such preparations are inappropriate for testing CRF activity.

Tournut, J., Le Bars, H., Labie, C., Khamouma, M.: "Prévention des effets de l'immobilisation forcée chez le Porc par certains neuroleptiques" (Prevention of the effects of forced immobilization in the pig by certain neuroleptics). *C. R. Acad. Sci. (Paris)* **260**: 5415-5418 (1965). G66,777/65

In pigs, immobilization causes loss of weight and gastric ulcers which can be considerably diminished by *chlorpromazine* and other neuroleptic agents.

Schulz-Baldes, J. G.: "Prüfung einiger alter Sedativa und des Phenacetins auf antistressorische Wirkungen" (Investigation of some old sedatives and of phenacetin for anti-stress activity). *Arzneim. Forsch.* **15**: 835-837 (1965). F49,128/65

Ascorbic acid depletion produced in rats by various stressors was not significantly prevented by hop meal, *phenacetin*, *sodium bromide*, *valerian* and magnesium sulfate. None of these substances exhibited "any noteworthy anti-stress activity—not even

phenacetin. Hence, they have no specific sedative effect on the hypophyseal-adrenal system."

Rosecrans, J. A., Feo, J. J. de: "The interrelationships between chronic restraint stress and reserpine sedation." *Arch. Int. Pharmacodyn. Ther.* **157**: 487-497 (1965).

F54,866/65

In rats, stress by restraint initially increased the 5-HT and decreased the NEP content of the brain. "Reserpinated stress animals were more easily handled at first, but became more excitable and difficult to handle as the experiment progressed." This change appeared to correlate with the continued depletion of brain NEP because the brain 5-HT remained approximately constant. The possible protective effect of *reserpine* is considered in connection with the G.A.S.

Barrett, A. M., Stockham, M. A.: "The response of the pituitary-adrenal system to a stressful stimulus: the effect of conditioning and pentobarbitone treatment." *J. Endocrinol.* **33**: 145-152 (1965).

F49,945/65

In rats, deep *pentobarbital* anesthesia diminished the rise in plasma corticosterone normally elicited by various stressors.

Michalová, C., Hrubeš, V., Beneš, V.: "The influence of *chlordiazepoxide* on biochemical reactions to experimental stress in rats." *Activ. Nerv. Sup. (Praha)* **8**: 458-459 (1966).

J23,495/66

Ordy, J. M., Samorajski, T., Schroeder, D.: "Concurrent changes in hypothalamic and cardiac catecholamine levels after anesthetics, tranquilizers and stress in a subhuman primate." *J. Pharmacol. Exp. Ther.* **152**: 445-457 (1966).

F67,727/66

In squirrel monkeys, various stressors cause a concurrent depletion of hypothalamic and cardiac NEP. Pretreatment with *chlorpromazine* or *haloperidol* inhibits both these effects.

Martinez, L. R., Euler, C. von, Norlander, O. P.: "The sedative effect of *premedication* as measured by catecholamine excretion." *Br. J. Anaesth.* **38**: 780-786 (1966).

G42,455/66

Buckley, J. P., Vogen, E. E., Kinnard, W. J.: "Effects of pentobarbital, acetylsalicylic acid, and reserpine on blood pressure and survival of rats subjected to experimental stress." *J. Pharm. Sci.* **55**: 572-575 (1966).

F67,051/66

Chronic exposure of rats to a variety of

stressors (strong light, sound, electric shock) produces hypertension which is not prevented by *pentobarbital* or *acetylsalicylic acid* but is diminished by *reserpine*. The ulcerogenic effect of stressors is aggravated by *acetylsalicylic acid*.

Ganong, W. F., Boryczka, A. T., Lorenzen, L. C., Egge, A. S.: "Lack of effect of α -ethyltryptamine on ACTH secretion when blood pressure is held constant." *Proc. Soc. Exp. Biol. Med.* **124**: 558-559 (1967).

F77,622/67

In dogs, increased ACTH secretion produced by hemorrhage is prevented by *α -ethyltryptamine* (etryptamine) in doses that restore the blood pressure. Presumably, "it is the rise in blood pressure produced by *α -ethyltryptamine* that causes the inhibition of ACTH secretion."

Pishkin, V., Shurley, J. T., Wolfgang, A.: "Stress. Psychophysiological and cognitive indices in an acute double-blind study with hydroxyzine in psychiatric patients." *Arch. Gen. Psychiatry* **16**: 471-478 (1967).

G46,638/67

In psychiatric patients with "cognitive stress," it was found that "(1) anxiety and muscle tension were reduced in *hydroxyzine* groups with no impairment of decision making capability; (2) antecedent unavoidable failure interfered with decision making in placebo and control groups, while the interference was significantly reduced in *hydroxyzine* groups; (3) autonomic levels of activation decreased at a significantly higher rate in *hydroxyzine*-treated Ss during the extinction phase than in the placebo and the no-drug groups, and pain thresholds of *hydroxyzine* patients were significantly higher than those in the no-drug groups; and (4) physiological levels of activation increased with increase in the amount of information input" (27 refs.).

Dandiya, P. C., Varma, R. R., Sogani, R. K., Khuteta, K. P.: "Effect of *reserpine* and *chlorpromazine* on some cold stress-induced biochemical alterations." *J. Pharm. Sci.* **56**: 300-301 (1967).

Dasgupta, S. R., Mukherjee, B. P.: "Effect of *chlordiazepoxide* on stomach ulcers in rabbit induced by stress." *Nature* **215**: 1183 (1967).

F87,560/67

In rabbits, the gastric ulcers and eosinopenia produced by electroshock or restraint were inhibited by *chlordiazepoxide*.

Vunder, P. A., Fefer, M. I., Batanova, G. K., Dorofeeva, R. V.: "Stress and compensatory hypertrophy of the adrenal gland in conditions of prolonged *reserpin* administration." *Probl. Endokrinol.* **14** No. 5: 82-86 (1968) (Russian). H4,672/68

Buckley, J. P., Parham, C., Smookler, H. H.: "Effects of *reserpine* on rats subjected to prolonged experimental stress." *Arch. Int. Pharmacodyn. Ther.* **172**: 292-300 (1968). F99,053/68

Reserpine prevented the hypertension which develops in rats exposed to diverse stressors.

Brown, M. L., Sletten, I. W., Kleinman, K. M., Korol, B., "Effect of *oxazepam* on physiological responses to stress in normal subjects." *Curr. Ther. Res.* **10**: 543-553 (1968). J23,435/68

Prabhu, S., Sharma, V. N.: "Study of thermal stress induced haematological changes and their modification by *chlorpromazine* in rats." *Indian J. Med. Res.* **56**: 742-753 (1968). G61,228/68

Usher, D. R., Ling, G. M., MacConaill, M.: "Some endocrine and behavioural effects of *chlordiazepoxide* in septal-lesioned rats." *Int. J. Clin. Pharmacol.* **1**: 191-196 (1968). G64,766/68

Rats with septal lesions developed a typical behavioral pattern, the "septal syndrome," with enhanced ACTH synthesis, but diminished release of this hormone during stress. "*Chlordiazepoxide*" reduced the hyper-reactivity of septal-lesioned rats, but had no effect on endocrine organ weights; the reduction of hyper-reactivity was more marked in the stressed animals. Lesioned rats had larger adenohypophyses than sham-operated animals. The weight of this gland was reduced in all stressed animals, whether sham-operated or lesioned. It is postulated that mild stress and *chlordiazepoxide* both contribute to a diminished hyper-reactivity of rats with septal lesions."

Harrer, G., Harrer, H.: "Untersuchungen zur Objektivierung von Tranquillizer-Effekten" (Objective studies of the effects of *tranquilizing agents*). *Arzneim. Forsch.* **20**: 921-923 (1970). J20,323/70

Świątecka, G.: "The influence of ipronal on chronic neurotropic stress in white rats." *Arch. Immunol. Ther. Exp. (Warszawa)* **19**: 911-914 (1971). J20,325/71

In rats, various *tranquillizers* and *barbiturates*, particularly *ipronal*, suppress the typical consequences of psychogenic stress.

Corrodi, H., Fuxé, K., Lidbrink, P., Olson, L.: "Minor tranquilizers, stress and central

catecholamine neurons." *Brain Res.* **29**: 1-16 (1971). G85,849/71

Chlordiazepoxide, diazepam and *nitrazepam* blocked the stress-induced stimulation of NEP neurons by decreasing their nervous activity. Chlordiazepoxide and diazepam potentiated the stress (restraint)-induced fall in nervous activity in ascending dopaminergic neurons. Stress combined with these drugs therefore decreased dopamine turnover in the telencephalon in comparison with normal rats (67 refs.).

Krulik, R., Černý, M.: "Effect of chlordiazepoxide on stress in rats." *Life Sci. [I]* **10**: 145-151 (1971). G84,266/71

In rats, electroshock caused an important increase in blood corticosterone. "*Chlordiazepoxide* or *diazepam* injected to the animals before the stress decreased significantly the level of corticosterone in blood of stressed animals."

Neshev, G.: "The effect of chlorpromazine and phenamine on the basal metabolism and conditioned reflex activity of rats under stress conditions." *Farmakol. Toksikol.* **34**: 674-676 (1971) (Russian). J22,360/71

Experiments on rats showed that "stress factors lessen the depressive influence of *chlorpromazine* on the basal metabolism and potentiate the effect of *phenamine*. Stress weakens the action of chlorpromazine on the inhibitory processes in the brain cortex, intensifying the processes of excitation and summing up the effects of *phenamine* and stress factors on the higher nervous activity."

Lehmann, H. E., Ban, T. A.: "Pharmacotherapy of tension and anxiety." *Curr. Psychiatr. Ther.* **12**: 70-80 (1972) (55 refs.). J16,983/72

Ehrenstein, W., Schaffler, K., Müller-Limmroth, W.: "Die Wirkung von Oxazepam auf den gestörten Tagschlaf nach Nachschichtarbeit" (The effect of oxazepam on day sleep disturbed due to night work). *Arzneim. Forsch.* **22**: 421-427 (1972). J15,868/72

In nurses doing night shift work, *oxazepam* aided adjustment to sleeping during the day. "In oxazepam day sleep, the sleep of stage 3 and 4 and the REM sleep were increased to the values registered in night sleep. In oxazepam day sleep the share of waking periods remained clearly below the reference values of normal day and night sleep. Stage 1 and 2 of orthodox sleep were increased in oxazepam

day sleep as compared to normal day sleep but did not reach the values of night sleep."

Ajika, K., Kalra, S. P., Fawcett, C. P., Krulich, L., McCann, S. M.: "The effect of stress and Nembutal on plasma levels of gonadotropins and prolactin in ovariectomized rats." *Endocrinology* **90**: 707-715 (1972). H52,545/72

"The stress of etherization and bleeding produced an elevation within 2 min in the plasma levels of prolactin, LH, and FSH in ovariectomized rats. . . . Nembutal blocked the stress-induced elevations of plasma prolactin and LH but did not affect the levels of FSH. The effect of Nembutal is thought to be on the CNS since the Nembutalized rats responded to hypothalamic extract or ovine LRF with dramatic elevations in plasma LH."

Turton, M. B., Deegan, T., Geddes, I. C.: "The effects of intraperitoneal injection of lignocaine on plasma catecholamine levels in unstressed and stressed rats." *Br. J. Anaesth.* **44**: 460-464 (1972). G91,803/72

Krulík, R., Černý, M.: "Influence of chlordiazepoxide on blood corticosterone under repeated stress." *Activ. Nerv. Sup.* (Praha) **14**: 31-34 (1972). J20,548/72

In rats, chlordiazepoxide can inhibit the rise in blood corticosterone normally elicited by electric shocks.

Arch. Arbeitsmed.* **31**: 81-103 (1973) (about 50 refs.). J17,472/73

Reier, C. E., George, J. M., Kilman, J. W.: "Cortisol and growth hormone response to surgical stress during morphine anesthesia." *Anesth. Analg. (Cleve.)* **52**: 1003-1010 (1973). J8,185/73

After surgery, the usual increase in plasma cortisol and STH was blocked by large doses of morphine used in connection with anesthesia. Adrenocortical responsiveness was not affected, as indicated by the continued efficacy of exogenous ACTH in raising plasma cortisol. The blockade of these hormone secretions during stress did not seem to influence the clinical condition. "Nonetheless, since it is thought that the adrenocortical response is essential for stress survival, the recommendation that morphine in doses larger than 2 mg./kg. be avoided, appears prudent."

Davies, J. A., Navaratnam, V., Redfern, P. H.: "The effect of phase-shift on the passive avoidance response in rats and the modifying action of chlordiazepoxide." *Br. J. Pharmacol.* **51**: 447-451 (1974).

H92,485/74

"In rats trained to a 12 h light-12 h dark cycle, advancing the phase by 6 h produced a resynchronization of the 24 h variation in passive avoidance response (PAR) which was completed after 10 days." Chlordiazepoxide lessened the disruptive effect of phase-shift. The clinical implications of this work are discussed.

Boucsein, W., Janke, W.: "Experimental-psychologische Untersuchungen zur Wirkung von Propiramfumarat und Promethazin unter Normal- und Stress-bedingungen" (Experimental-psychologic studies on the action of propiram fumarate and promethazine under normal and stress conditions). *Arzneim. Forsch.* **24**: 675-693 (1974). H86,778/74

A new tranquilizer, *propiram fumarate*, as well as *promethazine*, proved beneficial in decreasing various manifestations of sound-induced psychogenic stress in man.

Hodges, J. R., Vellucci, S.: "The effect of reserpine on pituitary-adrenocortical function in the rat." *Br. J. Pharmacol.* **50**: 466P (1974). H86,673/74

In rats, a single intraperitoneal injection of *reserpine* caused adrenal ascorbic acid depletion and plasma corticosterone increases. After a week of daily injections, these changes no longer developed, "indicating that the alkaloid no longer acted as a stressful stimulus, i.e. some form of 'adaptation' occurred." Yet at this time exposure to "cold stress" still caused an increase in plasma corticosterone, although without concomitant ascorbic acid depletion. The authors conclude that reserpine inhibits the hypothalamus-pituitary-adrenocortical system only under very special conditions.

Cosgrove, D. O., Jenkins, J. S.: "The effects of epidural anesthesia on the pituitary-adrenal response to surgery." *Clin. Sci. Molec. Med.* **46**: 403-407 (1974).

J10,530/74

In women undergoing pelvic operations under *epidural anesthesia*, cortisol secretion was very low compared to its level in others operated on under general anesthesia. Despite this deficient cortisol discharge, surgery was not impeded. The observations may be interpreted as indicating that "these pathways travel solely through the spinal cord" and hence are blocked by epidural anesthesia.

Rayfield, E. J., George, D. T., Beisel, W. R.: "Altered growth hormone homeostasis during acute bacterial sepsis in the rhesus monkey." *J. Clin. Endocrinol. Metab.* **38**: 746-754 (1974). H86,214/74

Studies on monkeys demonstrate an exaggerated STH response following an intravenous glucose load during the stress of acute infection, and suggest that the reaction may be suppressed with *chlorpromazine*.

Villeneuve, C.: "Effets du Chlordiazepoxide et du Diazepam sur les changements

morphologiques et biochimiques induits par le stress" (Effects of chlordiazepoxide and diazepam on the morphologic and biochemical changes induced by stress). *Ann. ACFAS* **41**: 165 (1974). H88,191/74

Chlordiazepoxide and *diazepam* suppress only some of the manifestations of stress caused by sound in the rat. Their effect is not conspicuous.

Schumpelick, V., Paschen, U.: "Vergleich der protektiven Wirkung von Diazepam und Vagotomie auf das Stressulkus der Ratte" (Comparison of the protective activity of diazepam and vagotomy on stress ulcers in rats). *Arzneim. Forsch.* **24**: 176-179 (1974). H82,750/74

In rats, stress ulcers produced by restraint can be inhibited by *diazepam* pretreatment or vagotomy, but combined application of both agents offers the best protection. "This fact demonstrates a different mode of action. The antiulcerative effect of diazepam is explained by its direct action on the vegetative regulation centres in the hypothalamic and limbic system, leading to a partial inhibition of the vagally controlled HCl-pepsin component and the splanchnic nerve dependent vascular factor of ulcerogenesis as well."

Lahti, R. A., Barsuhn, C.: "The effect of minor tranquilizers on stress-induced increases in rat plasma corticosteroids." *Psychopharmacologia* **35**: 215-220 (1974).

J11,100/74

In rats the increase in plasma corticoids produced by the stressor effect of a noisy environment could be inhibited by *meprobamate*, *phenobarbital*, *diazepam* and several other benzodiazepines with anxiolytic properties. "U-33,030 and U-31,889, two triazolo-benzodiazepine derivatives, were the most potent compounds tested. No other type of psychoactive compound demonstrated this activity."

Boucsein, W.: "Die Wirkung von Chlordiazepoxyd unter Angstbedingungen im psychophysiologischen Experiment" (The effect of chlordiazepoxide on anxiety. A psychophysiological experiment). *Arzneim. Forsch.* **24**: 1112-1114 (1974). H91,785/74

In anxious patients the expectation of an electric shock produces a typical stress response, as indicated by heart rate, GSR and breathing. Pretreatment with *chlordiazepoxide* largely combats this response.

Niemegeers, C. J. E., Nueten, J. M. van, Janssen, P. A. J.: "Azaperone, a sedative

neuroleptic of the butyrophenone series with pronounced anti-aggressive and anti-shock activity in animals." *Arzneim. Forsch.* **24**: 1798-1806 (1974). H97,389/74

Hiebert, L. M., Jaques, L. B.: "Blocking of stress by pentobarbital-morphine as related to training and age of rats." *Steroids Lipids Res.* **5**: 255-261 (1974). K1,176/74

In experiments with several stressors, "pentobarbital-morphine" blocked the adrenal ascorbic acid depletion by stress when young trained rats were used. No block in adrenal ascorbic acid depletion occurred in untrained rats or in older trained rats."

Weiger, E.: "Medikamentöse Anxiolyse im Rahmen der Operationsvorbereitung" (Treatment of preoperative anxiety with tranquilizers). *Med. Welt.* **25**: 1774-1782 (1974). H96,097/74

Essai de correction par le méclofénoxate" (The influence of various stressors on hypothalamo-hypophyseal neurosecretory modifications. Attempt at correction by meclofenoxate). *Ann. Anesth. Fr.* **15**: 517-522 (1974).

J19,327/74

In rats, various stressors cause an immediate disappearance of Gomori granulations from the hypothalamus, with hemorrhagic lesions in the adrenals. *Meclofenoxate* (an analeptic drug) inhibits these changes and acts as an "antistress substance."

Neshev, G.: "The effect of aminazinum and phenaminum on stress in experimental conditions." *Patol. Fiziol. Éksp. Ter.* **14** No. 5: 42-46 (1974) (Russian). J24,151/74

In rats, *chlorpromazine* and *phenocoll* (phenamine) counteract the stress produced by burns, as judged by its classic morphologic and hormonal indicators.

Hodges, J. R., Vellucci, S.: "Pituitary-adrenocortical function in the reserpine-treated rat." *J. Endocrinol.* **61**: xxvi (1974). H87,552/74

In rats, *reserpine* causes a pronounced initial increase in plasma corticosterone with a diminution of adrenal ascorbic acid; upon continued daily injections, this response gradually fades, and even ACTH secretion after "cold stress" is inhibited.

Webb, S. D., Collette, J.: "Urban ecological

and household correlates of *stress-alleviative drug use*." *Am. Behav. Sci.* (In press).

J23,442/75

Hodges, J. R., Vellucci, S. V.: "The effect of *reserpine* on hypothalamo-pituitary-adrenocortical function in the rat." *Br. J. Pharmacol.* **53**: 555-561 (1975).

K1,166/75

In rats, "inhibition of stress-induced ACTH release was due neither to depletion of pituitary stores of the hormone, nor to a corticosteroid feedback effect."

Autonomic Blocking Agents

(See also our earlier stress monographs, p. xiii)

Peterfy, G., Pinter, E. J., Cleghorn, J. M., Pattee, C. J.: "Observations on the adrenergic mechanism of hyperadipokinesis of emotional stress." *Proc. Can. Fed. Biol. Soc.* **9**: 64 (1966). F66,182/66

In men and women, the emotional stress of threatening suggestions leads to hyperadipokinesis. "The primary factor appears to be the adrenergic nervous system." This response, associated with marked increases in plasma FFA and catecholamine levels, is prevented by a β -adrenergic-blocking agent (propranolol).

Smookler, H. H., Buckley, J. P.: "Effect of drugs on animals exposed to chronic environmental stress." *Fed. Proc.* **29**: 1980-1984 (1970). H32,862/70

In rats exposed to various stressors (sound, flashing lights, vibration), α -MT prevented the increase in blood pressure without raising mortality. Presumably, this result occurs because α -MT reduces the catecholamine level by inhibiting their synthesis, but leaves the catecholamine-binding system intact. "The combination of a reduced amount of liberated transmitter plus rapid inactivation by an intact binding system may serve to dampen the stress-induced activation of central sympathetic centers" (29 refs.).

Cleghorn, J. M., Peterfy, G., Pinter, E. J., Pattee, C. J.: "Verbal anxiety and the beta adrenergic receptors: a facilitating mechanism?" *J. Nerv. Ment. Dis.* **151**: 266-272 (1970). J20,728/70

Studies on man "indicate that beta adrenergic blockade with propranolol has no inhibiting effect on psychological anxiety in

healthy subjects when an operational measure of anxiety is used, and where bodily symptoms are absent."

Taggart, P., Carruthers, M.: "Suppression by oxprenolol of adrenergic response to stress." *Lancet* August 5, 1972, pp. 256-258.

H57,669/72

In racing-car drivers, oxprenolol given one hour before the race suppresses tachycardia, plasma FFA and total plasma catecholamine concentrations, as compared with values obtained for the same drivers on previous occasions. This β -blockade appears to diminish emotional stress without interfering with performance.

Lidén, S., Gottfries, C. G.: "Beta-blocking agents in the treatment of catecholamine-induced symptoms in musicians." *Lancet* August 31, 1974, p. 529.

H84,664/74

"Beta-blocking agents have been found to be of value in certain stress situations. In such situations the catecholamine output can be raised to a level which causes tremor. These effects may be unpleasant enough (e.g., when speaking before an audience), but they can be truly incapacitating for musicians." Alprenolol, a β -blocking agent, relieves the palpitation, increased muscular tonus, tremor and many other manifestations of the "catecholamine syndrome" in musicians playing various instruments.

Gupta, M. B., Tangri, K. K., Bhargava, K. P.: "Mechanism of ulcerogenic activity of reserpine in albino rats." *Eur. J. Pharmacol.* 27: 269-271 (1974).

H89,397/74

In rats, reserpine-induced gastric ulcers were prevented by α -adrenergic blockers, 6-hydroxydopamine and atropine, but not by adrenalectomy. Presumably, both adrenergic and cholinergic mechanisms are involved in reserpine-induced stress ulcers.

Backström, E., Nyberg, G.: "Effets de l'inhibition des récepteurs β sur les symptômes qui précèdent les examens universitaires" (Effects of β -receptor inhibition on the symptoms preceding university examinations). *Coeur Méd. Interne* 13: 149-154 (1974).

J21,826/74

"The β -inhibiting agents provide an advantage over the central acting sedatives, the tranquilizers: they do not affect cerebral efficiency."

Harvey, W. D., Falloona, G. R., Unger, R. H.: "The effect of adrenergic blockade on

exercise-induced hyperglucagonemia." *Endocrinology* 94: 1254-1258 (1974).

H85,696/74

In rats, forced swimming increases the plasma glucagon level. This response can be prevented by pretreatment with the α -adrenergic blocker, phentolamine, but not by propranolol. Presumably, exercise-induced hyperglucagonemia is largely mediated via α -adrenergic stimulation.

Ginseng, Eleutherococcus

(See also our earlier stress monographs, p. xiii)

Petkov, W., Staneva, D.: "Der Einfluss eines Ginseng-Extraktes auf die Funktionen der Nebennierenrinde" (The influence of ginseng extract on adrenal cortex functions). *Arzneim. Forsch.* 13: 1078-1081 (1963).

E38,058/63

"Substantial stress caused a mild drop in eosinophils in Ginseng-treated rats, while it produced a statistically significant rise in control animals." Curiously, large doses of ginseng elicited adrenal hypertrophy and eosinopenia in control rats.

Tsung, J. Y., Chen, C., Tang, S.: "The sedative, fatigue-relieving and temperature stress-combating effects of Panax ginseng." *Acta Physiol. Sinica* 27: 324-328 (1964) (Chinese).

J25,533/64

Iaremenko, K. V., Moskalik, K. G.: "The combined action of some stress effects and eleutherococcus extract on inoculation of tumor cells injected intravenously." *Vopr. Onkol.* 13 No. 9: 65-69 (1967) (Russian).

H4,112/67

In mice inoculated with Ehrlich tumor cells intravenously, intermittent cooling or injection of ACTH enhanced the take of neoplastic cells, but this effect could be eliminated by administering the eleutherococcus extract.

Brekhan, I. I.: "Panax ginseng. I." *Med. Sci. Serv.* 4 No. 3: 1-11 (1967).

J18,635/67

Brief English summary of the author's work (originally published in Russian, Chinese and Japanese) on the biochemistry and pharmacology of ginseng and related glycosides. The ginseng root itself, taken orally, allegedly increases work capacity in man and various species of animals. It may

also inhibit inflammation and cause premature sexual maturity in female mice. In rats, ginseng counteracts the thymicolympathic atrophy as well as the adrenal hypertrophy and hyperactivity elicited by the stress of restraint (11 refs.).

Golotin, V. G., Berdyshev, G. D., Brekhman, I. I.: "The effect of ginseng and eleutherococcus on the lifespan of white rats." *USSR Conf. on the Medicament Treatment in Advanced and Old Age*, USSR Acad. Med. Sci., USSR and Ukraine, p. 94 (1968).

J18,636/68

Brief abstract of an orally presented paper on the beneficial effect of ginseng and eleutherococcus upon the lifespan of rats alternatingly exposed to the stress of electric current and swimming. [The short résumé is difficult to evaluate (H. S.).]

Brekhman, I. I., Dardymov, I. V.: "New substances of plant origin which increase nonspecific resistance." *Annu. Rev. Pharmacol.* **9**: 419-430 (1969). J18,983/69

Review on the rise in nonspecific resistance obtainable by ginseng and related plant products. Special emphasis is placed upon their "antistress effect."

Brekhman, I. I., Kirillov, O. I.: "Effect of eleutherococcus on alarm-phase of stress." *Life Sci.* **8**: 113-121 (1969). G65,251/69

Observations in rats led the authors to the conclusion that "like Panax ginseng, eleutherococcus increases the resistance of an organism to stressors of various nature. This phenomenon finds some explanation in experiments which certify that eleutherococcus changes the course of the alarm-reaction, reducing activation of the adrenal cortex, thymus involution and stomach bleeding."

Kim, C., Kim, C. C., Kim, M. S., Hu, C. Y., Rhe, J. S.: "Influence of ginseng on the stress mechanism." *Lloydia* **33**: 43-48 (1970). J20,883/70

Experiments on rats suggested that the initial adrenal ascorbic acid depletion caused by heat or cold could be slightly diminished by feeding Korean ginseng root, and a similar inhibition occurred as regards the adrenal effects of ACTH, even after hypophysectomy. Hence apparently "ginseng acts upon the peripheral site of the stress mechanism in response to stress."

Brekhman, I. I., Berdyshev, G. D., Golotin, V. G.: "Effect of eleutherococcus and ginseng extracts on the activity and adaptive

synthesis of tryptophan pyrolase in rats." *Izv. Akad. Nauk SSSR [Biol.] No. 1: 31-37 (1971)* (Russian). J21,371/71

Eleutherococcus increases the activity and enhances the induction of tryptophan pyrolase in both intact and adrenalectomized rats, whereas ginseng decreases its induction only in the presence of the adrenals.

Ethanol

(See also our earlier stress monographs, p. xiii)

Greenberg, L. A., Lester, D.: "The effect of alcohol on audiogenic seizures of rats." *Q. J. Stud. Alcohol* **14**: 385-389 (1953). J23,511/53

In rats, audiogenic seizures were largely inhibited by moderate ethanol intake.

Korn, S. J.: "The relationship between individual differences in the responsiveness of rats to stress and intake of alcohol." *Q. J. Stud. Alcohol* **21**: 605-617 (1960).

D432/60

Rats "more responsive to stress may select alcohol solutions as a learned adaptive response. The alcohol may function to attenuate the effects of stress."

Coopersmith, S.: "Adaptive reactions of alcoholics and nonalcoholics." *Q. J. Stud. Alcohol* **25**: 262-278 (1964). J23,223/64

Study of the ability of alcoholics and nonalcoholics to tolerate threatening stimuli. "A review of literature led to the hypotheses that alcoholics were limited in such capacities and that alcohol both provided a relief from distress and increased adaptive capacities."

Geber, W. F., Anderson, T. A., Dyne, B. van: "Influence of ethanol on the response of the albino rat to audiovisual and swim stress." *Exp. Med. Surg.* **24**: 25-35 (1966). F67,524/66

In rats, ethanol blocked the stressor effect of forced swimming and audiovisual stimulation as judged by adrenal and brain ascorbic acid levels, serum cholesterol and other indicators (39 refs.).

Geber, W. F., Anderson, T. A.: "Ethanol inhibition of audiogenic stress induced cardiac hypertrophy." *Experientia* **23**: 734-736 (1967). F88,482/67

Morra, M.: "Ethanol and maternal stress on rat offspring behaviors." *J. Genet. Psychol.* **114**: 77-83 (1969). J22,650/69

A review of the literature concerning the effect of stress during pregnancy upon the offspring of rats. Administration of ethanol to the mother significantly diminished the influence of stress upon her young.

Wright, J. M. von, Pekannmäki, L., Malin, S.: "Effects of conflict and stress on alcohol intake in rats." *Q. J. Stud. Alcohol* **32**: 420-433 (1971). G84,239/71

In rats repeatedly exposed to the stressor effect of electroshocks, voluntary alcohol consumption may increase, although drinking water is also available *ad libitum*.

Smith, R. B., Balchius, D., Mueller, M.: "Comparative use of alcohol and chlorpromazine by experimentally stressed CF/1 mice." *Med. Ann. D.C.* **41**: 619-621 (1972).

Other Drugs

(See also our earlier stress monographs, p. xiii)

Selye, H.: "Studies on adaptation." *Endocrinology* **21**: 169-188 (1937).

38,798/37

First description of the anaphylactoid inflammation produced in the rat by parenteral administration of egg white. This response was aggravated by adrenalectomy and hence, presumably, some adrenal factor had anti-phlogistic effects. The experiment also showed that "in this case an alarm reaction, elicited by another drug [*formaldehyde*], exerted a protective influence" against egg white. Thus, we are dealing with a type of cross-resistance.

Tepperman, J., Rakieten, N., Birnie, J. H., Diermeier, H. F.: "Effect of antihistamine drugs on the adrenal cortical response to histamine and to stress." *J. Pharmacol. Exp. Ther.* **101**: 144-152 (1951). B59,242/51

In rats, various *antihistaminics* (Phenoxyadrine, Benadryl, Pyribenzamine) did not significantly alter the adrenal ascorbic acid concentration, but intraperitoneal injection of histamine reduced it remarkably. "Pre-treatment with an antihistamine drug did not prevent or modify the adrenal ascorbic acid response to the stress of intraperitoneal carbon tetrachloride administration."

Dufour, D., Rochette, A.: "Etude de l'influence des acides nucléiques du thymus sur la réponse non-spécifique à l'agression" (Study of the influence of thymic nucleic

acids on the nonspecific response to stress). *Ann. Endocrinol. (Paris)* **22**: 9-13 (1961). D3,652/61

Fox, C. L. Jr., Stanford, J. W.: "Comparative efficacy of hypo-, iso-, and hypertonic sodium solutions in experimental burn shock." *Surgery* **75**: 71-79 (1974).

J9,143/74

Comparative studies on the effect of hypotonic, isotonic and hypertonic *sodium chloride* solutions upon experimental burn shock in mice (43 refs.).

Brachfeld, N.: "Ischemic myocardial metabolism and cell necrosis." *Bull. N.Y. Acad. Med.* **50**: 261-293 (1974).

J10,994/74

Review of metabolic factors involved in stress-induced myocardial necrosis, with a section on the prophylactic and/or therapeutic role of *potassium*.

Smoking

(See also our earlier stress monographs, p. xiii)

Russek, H. I., Zohman, B. L.: "Relative significance of heredity, diet and occupational stress in coronary heart disease of young adults. Based on an analysis of 100 patients between the ages of 25 and 40 years and a similar group of 100 normal control subjects." *Am. J. Med. Sci.* **235**: 266-277 (1958).

A352/58

Hereditary predisposition and high-fat diets are undoubtedly important conditioning factors in CHD. However, among one hundred young coronary patients, "severe emotional strain of occupational origin was observed in 91% of the test subjects as compared with 20% of normal controls. Emotional stress associated with job responsibility appears far more significant in the etiologic picture of coronary disease in young adults than heredity or a prodigiously high-fat diet." Smoking would seem "to be an indication of heightened emotional tension rather than a predisposing or causative factor in coronary heart disease."

Russek, H. I.: "Stress, tobacco, and coronary disease in North American professional groups. Survey of 12,000 men in 14 occupational groups." *J.A.M.A.* **192**: 189-194 (1965).

F36,826/65

Statistical studies on twelve thousand professional men in fourteen occupational categories in the United States. On the basis of questionnaires evaluated by specialists in each field, CHD was "strikingly related to

the relative stressfulness of occupational activity" among physicians, lawyers, security analysts and traders. High-fat diets and smoking were associated with a high incidence in combination with emotional stress. Smoking was most frequent in stressful occupations, but unexpectedly, CHD was more common among nonsmokers than among persons who once smoked but gave it up. Possibly, "the ability to stop smoking may imply a resilient personality response to stress and diminished vulnerability to atherogenic influences."

Pincherle, G., Williamson, J.: "Smoking and neuroticism." *Lancet* October 30, 1971, p. 981.

J20,174/71

Statistical study showing that smoking was more frequent in patients under excessive stress than in nonstressed controls. "There was no difference between those stressed from work and those stressed from their home circumstances. One of the main reasons given by patients for smoking is the tranquillising effect, so it is not surprising to find a relationship with stress."

King, A. J.: "Stress, cigarette smoking and snacking behaviour in adolescent males." *Can. J. Public Health* **62**: 297-302 (1971).

G86,388/71

Among male adolescents, stress (caused by examinations) produced more significant changes in snacking than in smoking. "Stressed non-smokers snacked significantly more than unstressed non-smokers. Unstressed smokers snacked significantly more than unstressed non-smokers."

Ashton, H., Savage, R. D., Telford, R., Thompson, J. W., Watson, D. W.: "The effects of cigarette smoking on the response to stress in a driving simulator." *Br. J. Pharmacol.* **45**: 546-556 (1972).

J14,838/72

Lindenthal, J. J., Myers, J. K., Pepper, M. P.: "Smoking, psychological status and stress." *Soc. Sci. Med.* **6**: 583-591 (1972).

G95,675/72

Report on a statistical survey concerning the relationship between life crises and smoking behavior.

Luban-Plozza, B.: "Das Problem der Tabakentwöhnung" (The problem of nicotine withdrawal). *Öst. Arzteztg.* **28**: 1093-1111 (1973).

J13,887/73

Review on breaking the smoking habit. The author distinguishes between "pleasure

smokers" and "stress smokers." The latter smoke to relieve anxiety or other psychogenic stresses. For them, it is very difficult to stop smoking because they develop depressions and impairment of performance if they do not smoke, so that those around them usually try to talk them into resuming the habit. Various practical suggestions are made (numerous refs.).

Hall, G. H., Morrison, C. F.: "New evidence for a relationship between tobacco smoking, nicotine dependence and stress." *Nature* **243**: 199-201 (1973).

H78,377/73

Rats that have learned to avoid electric shock under the influence of nicotine can become dependent upon this drug for successful performance. Presumably, "this dependence is related to the degree of stress to which the animal is exposed."

Schechter, M. D.: "Effect of nicotine on response to frustrative non-reward in the rat." *Eur. J. Pharmacol.* **29**: 312-315 (1974).

H96,851/74

"Rats were subjected to frustrative non-reward in the Amsel double runway after administration of nicotine and saline. Results revealed that nicotine decreases the magnitude of the frustrative effect when compared to saline."

Agué, C.: "Urinary catecholamines, flow

rate and tobacco smoking." *Biol. Psychol.* **7**: 229-236 (1974).
J12,382/74

Cigarette smoking significantly raised EP but not NEP excretion. The increased EP excretion was interpreted as "an adaptive mechanism to unspecific stress." However, in this respect, ordinary and nicotine-free cigarettes were equivalent, and the results may have been of psychogenic origin.

Luban-Plozza, B.: "Psychologische Motive des Rauchens" (Psychologic motives for smoking). *Münch. Med. Wochenschr.* **116**: 547-552 (1974).
H85,110/74

An analysis of motivation for smoking permits the distinction of four types, one of which is the "stress smoker," who turns to cigarettes mainly for their tranquilizing value and who allegedly tolerates pain much better if permitted to smoke. It appears paradoxical that although nicotine increases pulse rate and blood pressure, it has nevertheless been found to have a favorable effect upon stress tolerance, at least under certain circumstances. It remains to be shown to what extent this is due to pharmacologic actions or to social and psychic influences; for example, being offered a cigarette by an examining professor relaxes the candidate largely because of the friendliness of such a gesture. A "smoker personality" is often characterized by a tendency towards depression and intense variations in mood.

VI. THEORIES

GENERAL MECHANISMS

In this section, foremost emphasis will be laid upon the neurohumoral responses most characteristic of stress, especially the control of the discharge and action of corticoids and catecholamines. Additional data on the participation of many other hormones (STH, TTH, LH, FSH, thyroid hormone, insulin, glucagon), hormone-like substances (5-HT, histamine) and other chemical and morphologic parameters of the stress response will be found in the section Characteristic Manifestations of Stress; here, they will be discussed only in proportion to the little information we have about the functional role they play in the G.A.S.

To assist in an overview of this chapter, let us state at the outset that the material will be subdivided into the following sections:

Nervous mechanisms

Hormonal mechanisms

Various mechanisms

Some of the data pertaining to this last category have already been discussed in the introductory Outline—for example, the distinctions between syntoxic and cataxic hormones and between homeostasis and heterostasis. Here, we will present a general résumé of the neurohumoral coordinating mechanisms, that is, the pathways through which a stressor applied at any one target area spreads throughout the body. Finally, we will touch upon the very important behavioral implications of somatic research on stress.

NERVOUS MECHANISMS

Generalities

It would be almost impossible to present a well-balanced synoptic summary of the participation of nervous mechanisms in stress reactions since, depending upon the nature of the stressor and of the conditioning factors, virtually any pathway of the central and peripheral nervous system may be involved. Yet this system plays such a cardinal role in the mediation of stress responses, especially in man and other higher animals, that it does deserve detailed consideration.

After giving this matter much thought and discussing it with many competent specialists in the field of neurophysiology, I seriously considered two possibilities: (1) to describe the pathways on an anatomic basis, following the course of impulses

that lead to the mobilization of the stress mechanism or (2) to use a biochemical basis for classification and consider pathways separately, according to the neurohumoral mediators responsible for their activation, irrespective of the anatomic regions through which they travel (for example, mediation through NEP, dopamine, 5-HT, acetylcholine and other less-researched possible mediators, such as histamine or GABA).

However, the enormous number of pertinent observations in the literature and their apparently contradictory nature convinced me that I could not present a balanced picture using either of these classifications. It was decided instead to construct a practical index, putting major emphasis upon a correct, objective description of individual key publications. Thus, I will cite data on each morphologic nervous structure merely in alphabetic order in the present section and I will discuss the neurohumoral mechanisms conjointly with the purely hormonal ones in the next division, which is devoted to Hormonal Mechanisms. I will deviate from this principle only in the case of: (1) the corticotropin-releasing factor (CRF) because its discharge and mediation through nerves and vascular pathways are primarily morphologic problems and (2) the cerebrospinal fluid (CSF) whose participation in stress as a morphologic unit has attracted much more attention than has its chemical composition.

Thus, this section does not represent so much an analysis and criticism of the literature as a simple key, designed merely to give ready access to the principal facts known about the participation of various nervous structures in the stress response. It is based mainly on the observations and interpretations of those who selectively explored one or the other of these structures, either by producing localized lesions, by stimulating circumscribed parts of the nervous system or by examining microscopic changes in them during stress.

Since I have tried to make this encyclopedia accessible to scientists interested in any aspect of stress, it is evident that many of my readers (physiologists, clinicians, biochemists, or even psychologists and psychiatrists) will not be sufficiently familiar with the more complex aspects of modern neuroanatomy to make good use of this section. Therefore, by way of an introduction, I present a concise dictionary of the more common technical terms and a few especially illustrative anatomic drawings and explanatory charts for general orientation. Most of these were taken from the excellent text, *A Neurophysiological Model of Emotional and Intentional Behavior* by John L. Weil of Harvard Medical School, with the kind permission of the author and Charles C Thomas, Publisher.

They will help give an overview of the location of various subsequently-mentioned structures, as well as provide a key to the nomenclature, which is often confusing because in many cases several synonymous designations are used.

In addition, I felt that at least a brief outline of the established basic facts concerning CRF and the total deafferentation of the hypophysiotropic area should be stated at the outset. After all, whatever other pathways are followed during the early mediation of stress responses, eventually they mobilize the pituitary-adrenocortical system through CRF, which is produced in an area of the hypothalamus that can now be isolated by surgical deafferentation. I did not see any way of discussing all other aspects in a similar manner. However, it was hoped that even the most superficial outline of these two basic areas of information, combined with the introductory illustrations explaining the structure and nomenclature of the regions to be discussed, would be of considerable help to the nonspecialist in this field. For more precise in-

formation, readers will have to turn to the corresponding abstract sections and in many cases even obtain the original publications in order to clarify apparent contradictions due to differences in methodology or actual errors in observation or interpretation.

Finally, those who wish to cover a particular field as completely as possible can refer to the sections Generalities, Hypothalamus, Limbic System, which contain data pertinent to virtually any other specifically-mentioned structure as they present an overview of the principal pathways of impulses through which the stressor's stimulus is transmitted from the nervous to the hormonal system.

Dictionary

Of course, every term and synonym mentioned in the publications subsequently cited cannot be enumerated here. Hence, this dictionary will be limited to the clarification of frequently-used synonyms or variably-formulated anatomic descriptions that may be confusing. Other nervous structures that have been discussed in separate sections, though unlikely to cause confusion, are merely listed for the sake of completeness, thereby giving the reader an index of what is to come.

Amygdala Amygdaloid body. The cerebellar tonsil.

Brain Stem See *Mesencephalon*.

Cerebrospinal fluid (CSF).

Cerebrum.

Cortex The covering gray area of the brain and cerebellum.

Corticotropin-releasing factor (CRF).

Diencephalon Between brain, interbrain. Posterior part of the prosencephalon including the epithalamus, thalamus, hypothalamus, subthalamus and metathalamus.

Ependyma The epithelial cells which cover all cavities of the brain and spinal cord.

Their elements are not nervous, but probably are more closely related to glia cells.

Fornix A paired structure consisting primarily of longitudinal white fibers, lying beneath the corpus callosum and just above the tela chorioidea of the third ventricle.

Habenula The dorsal peduncles of the pineal body. These are parts of the epithalamus of the diencephalon and each contains medial and lateral habenular nuclei. They continue on both sides with the striae medullares of the thalamus and the habenular commissure.

Hindbrain See *Rhombencephalon*.

Hippocampus Hippocampus major; cornu Ammonis (Ammon's horn), a curved elevation consisting mainly of gray matter, in the floor of the inferior horn of the lateral ventricle.

Hypothalamic Deafferentation A surgical procedure that permits the complete separation of the hypophysiotropic area of the hypothalamus, which can then receive no nervous input but remains in contact with the pituitary through the blood vessels of the stalk.

Hypothalamus Part of the region of the diencephalon that forms the floor of the third ventricle, including neighboring associated nuclei. It is divided into: (1) The anterior region, or pars supraoptica, above the optic chiasma. This includes the supraoptic and paraventricular nuclei and a less differentiated nucleus that merges with the preoptic area (the anterior hypothalamic nucleus). (2) The middle region,

the pars tuberalis (tuber cinereum), including the lateral hypothalamic and tuberal nuclei, lateral to a sagittal plane passing through the anterior column of the fornix, and the dorsomedial, ventromedial and posterior hypothalamic nuclei, medial to the above plane. (3) The caudal region, or mammillary bodies, including medial, lateral and intercalated mammillary nuclei and premammillary and supramammillary nuclei.

Insula of Reil The portion of the cerebral cortex that overlies the corpus striatum. In adult human brains, it is not visible from the outside because it is underneath the bottom of the lateral fissure.

Limbic System A ring of cerebral cortex, composed of the limbic lobe and associated subcortical nuclei, such as the amygdaloid complex, septal nuclei, hypothalamus, habenula, anterior thalamic nuclei and parts of the basal ganglia. It is the oldest portion of the cortex possessing evolutionary rudiments even in reptiles, amphibians and fish. Probably controls various emotional and behavioral patterns.

Median Eminence (ME) A longitudinal ridge in the floor of the fourth ventricle, bounded medially by the median sulcus and laterally by the sulcus limitans.

Medulla Oblongata, Pons, Locus caeruleus.

Mesencephalon The part of the brain developed from the middle cerebral embryonic vesicle. It consists of the tectum with the corpora quadrigemina and the cerebral peduncles, and is traversed by the cerebral aqueduct of Sylvius (synonym: mid-brain).

Midbrain See *Mesencephalon*.

Peripheral Nerves.

Reticular Activating System The reticular formation of the superior levels of the brain stem and the adjacent subthalamus, hypothalamus and medial thalamus. As indicated by animal experiments, it plays a basic role in coordinating the activity of the CNS. It is connected by collaterals with long afferent and efferent nervous pathways, and thus interacts with them. Caudal impulses upon spinal cord levels contribute to optimum motor performance. Cephalic influences upon the cerebral hemispheres form the basis of wakefulness and arousal on which higher CNS functions depend. Many hypnotic and ataractic drugs block transmission of impulses from this area, and lesions in it cause states similar to coma.

Reticular Formation or Substance Also called *formatio reticularis*. A part of the CNS consisting of small islands of gray matter separated by fine nerve fiber bundles. These run in every direction and fill the interspaces between the larger fiber tracts and nuclei.

Rhinencephalon (Archicortex) The portion of the brain believed to receive and integrate olfactory impulses, and to regulate appropriate motor activities in response to these. It comprises the hippocampal formation, the olfactory and the piriform lobes, including the olfactory bulb and peduncle, parolfactory (Broca's) area, subcallosal gyrus and anterior perforated substance. However, a portion of this area is not concerned with olfaction.

Rhombencephalon The hindbrain or afterbrain, divided secondarily into the metencephalon and myelencephalon. It is derived from the most caudal of the three primary embryonic brain vesicles and includes the pons, cerebellum and medulla oblongata.

Septum A translucent membrane that separates the lateral vesicles of the brain and comprises two laminae which surround the so-called fifth ventricle.

Spinal Cord.

Stalk, Portal Vessels The hypophyseal stalk connects this gland with the hypothalamic part of the brain and contains portal vessels. The latter are comparatively large veins that bring blood from the capillary plexus in the ME to another capillary plexus in the anterior lobe of the hypophysis.

Telencephalon The anterior part of the primary embryonic forebrain that develops into the olfactory lobes, cerebral lobes and corpora striata.

Thalamus See *Hypothalamus*.

Nervous vs. Systemic Stressors

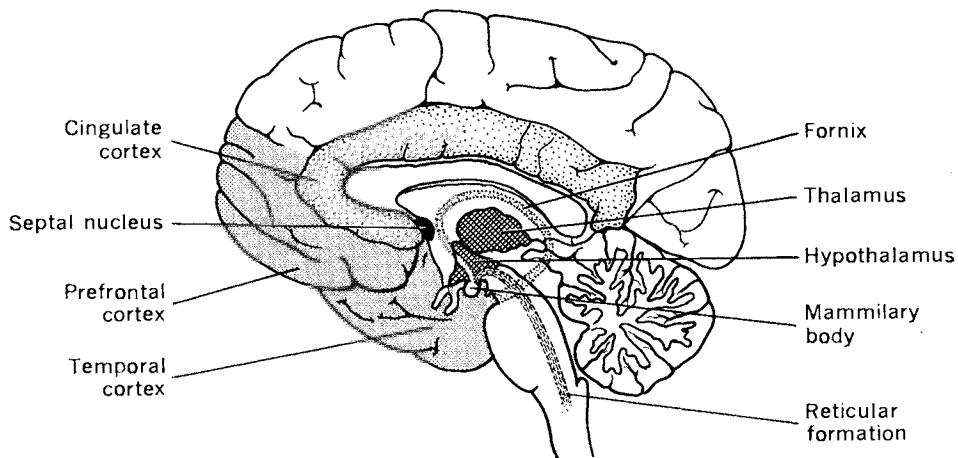

Anatomic Drawings and Explanatory Tables

General Discussion of CRF and the Results of Experiments with Deafferentation of the Hypophysiotrophic Area

CRF. CRF activity has been demonstrated in hypothalamic tissue, and there is overwhelming evidence to indicate that this substance occurs in the ME, a region of the MBH, also called the "hypophysiotrophic area." The circadian peak in the CRF concentration of the hypothalamus precedes that of corticosterone in the blood by three hours.

Anterior pituitary homografts can maintain ACTH secretion only if they are placed in immediate contact with the ME and if the development of vascular connections between the two structures is not prevented by some impenetrable membrane. The neurons of the hypophysiotrophic area terminate in the ME, which is supplied with no other nerve endings.

The posterior pituitary is extremely rich in CRF activity and it is commonly as-

sumed today that the latter merely represents a store of the CRF that comes from the ME. Yet we still have no definite proof that the CRF of the ME is chemically identical with that found in the neurohypophysis.

Deafferentation. Our understanding of the mechanism through which ACTH secretion can be stimulated under various conditions has been considerably clarified by the important discovery that the entire hypophysiotrophic area can be isolated from the rest of the brain by surgical intervention, using a circular knife pushed from the cortex down to the base of the skull. With this instrument (generally known as the Halász knife), it is possible to accomplish a complete deafferentation of the hypophysiotrophic area, which remains in contact with the pituitary only through the stalk.

After this intervention, there is no reduction in the basal secretion of ACTH which, in fact, is usually above normal. Furthermore, the anterior lobe can still respond to various stressors, such as ether, restraint, tourniquet shock, formalin and so on, by a rise in plasma ACTH, reflected in increased plasma corticosterone levels. Removal of one adrenal also causes compensatory hypertrophy of the contralateral gland. All these reactions fail to occur if the ME is destroyed.

However, the diurnal rhythm in pituitary ACTH secretion is abolished after deafferentation of the hypophysiotrophic area. Apparently, this ACTH release is regulated by nervous stimuli reaching the hypothalamo-hypophyseal system from other parts of the CNS. There is a good deal of evidence that the fibers regulating circadian ACTH secretion originate in the hippocampus. The rhythm is abolished about one week after transection of the fornix, yet it reappears three weeks later, suggesting that the fornix is not the only decisive structure.

Generalities

(See also our earlier stress monographs, p. xiii)

Houssay, B. A., Biasotti, A., Sammartino, R.: "Modifications fonctionnelles de l'hypophyse après les lésions infundibulo-tubérennes chez le crapaud" (Functional changes of the hypophysis after lesions of the lobus infundibularis in toads). *C.R. Soc. Biol. (Paris)* **120**: 725-727 (1935). B6,016/35

In the toad the hypothalamus consists of a pars basalis, lamina terminalis and lobus infundibularis. The latter is attached to the hypophysis. Lesions of the lobus infundibularis cause circulatory arrest in the principal lobe of the hypophysis with increased absorption of MTH, darkening of the animal, and other hormonal derangements.

D23,888/62

Review on the mechanism controlling corticoid secretion, especially during stress and under the influence of hypothalamic mediators.

Fortier, C.: "Adenohypophysis and adrenal cortex." *Ann. Rev. Physiol.* **24**: 223-258 (1962).

D21,959/62

Review on the regulation of ACTH secretion by neurohumoral substances, with special reference to stress (315 refs.).

Ganong, W. F.: "The central nervous system and the synthesis and release of adrenocorticotropic hormone." In: Nalbandov, A. V., *Advances in Neuroendocrinology*, pp. 92-149. Urbana, Ill.: University of Illinois Press, 1963.

J11,446/63

Review of the major hypotheses on the mechanism of ACTH release. The principal conclusion is that, *in vivo*, only ACTH and angiotensin have an established regulatory function in corticoid secretion. The hypothalamus and pituitary serve as an independent unit in the response to stress. With the possible exception of hindbrain pituitary pathways, no extrahypothalamic pathway has been shown to influence ACTH secretion during stress. Vasopressin may have some intrinsic CRF activity, but it is not the principal mediator. Corticoids inhibit ACTH synthesis more than its secretion. The ME increases ACTH release to meet emergencies, but there is a basal level at which the hormone is produced without necessarily being dependent upon neural control (700 refs.).

Scharrer, E., Scharrer, B.: *Neuroendocrinology*, p. 289. New York: Columbia University Press, 1963.

E4,032/63

Highly technical treatise on the relationships between endocrine glands and the nervous system. A separate chapter is devoted to the stress concept based on the works of Cannon and Selye. An extensive bibliography (74 pp.) gives easy access to the relevant technical literature.

the Pituitary-Adrenal Complex, p. 195. Leningrad: Nauka Press, 1971 (Russian). Engl. trans.: New York and London: Consultants Bureau, 1973. E10,650/73

Monograph mainly concerned with the central regulation of the hypophyseal-adrenocortical axis in relation to the G.A.S. Special chapters deal with the nervous centers and neurohumoral substances involved in the transmission of impulses. The English translation furnishes ready access to the many pertinent publications that have appeared in Russian (about 800 refs.).

Brown, G. M., Martin, J. B.: "Neuroendocrine relationships." *Prog. Neurol. Psychiatry* 28: 193-240 (1973). J10,042/73

Chapter on the regulation of hormone secretion by the nervous system, including the release of hormones during stress (587 refs.).

Lissák, K. (ed.): *Hormones and Brain Functions* (Proc. 2nd Congr. Int. Soc. Psychoneuroendocrinology. Budapest, 1971), p. 544. New York: Plenum Press, 1973.

E10,608/73

Report on the proceedings of an international congress with the participation of many outstanding specialists. Among the main topics considered are neonatal and ontogenetic aspects of neuroendocrinology; the control, biosynthesis and release of pituitary hormones; and hormonal influences on brain function.

Fortier, C., Labrie, F.: "Regulation of secretion." In: Berson, S. A. and Yalow, R. S., *Peptide Hormones*, pp. 383-391. Amsterdam: North-Holland, 1973. J12,062/73

Fortier, C.: *Cours d'Endocrinologie* (Course on endocrinology). (mimeographed, 1974). J12,063/74

Greatly simplified but excellent review on the neurohumoral control of the adenohypophysis.

Weil, J. L.: *A Neurophysiological Model of Emotional and Intentional Behavior*, p. 189. Springfield, Ill.: Charles C Thomas, 1974. E10,841/74

Papaikonomou, E.: *Biocybernetics, Biosystems Analysis and the Pituitary Adrenal System*, p. 334. Purmerend, Netherlands: Nooy's Drukkerij, 1974. E10,437/74

A monograph that combines insight and wit in applying the principles of biosystems analysis and biocybernetics to the pituitary-adrenocortical system in relation to the G.A.S.

Sayers' hypothesis about the activation of ACTH secretion by a negative feedback due to increased utilization of glucocorticoids during stress was not supported by subsequent experiments. It was replaced by the hypothesis of Yates that stress activates a controller of the system in the hypothalamus. Then Smelik provided evidence of an integral controller of the system with a derivative controller sensitive to negative rates of change of blood glucocorticoids. It is essential in studies concerning the regulation of corticoid secretion to consider the ACTH concentration of the blood and the blood flow as separate input variables, and to distinguish between the effect of unbound and protein-bound corticoids (about 450 refs.).

Amygdala

(See also our earlier stress monographs, p. xiii,
and cf. Limbic System)

Martin, J., Endrőczi, E., Bata, G.: "Effect of the removal of amygdaloid nuclei on the secretion of adrenal cortical hormones." *Acta Physiol. Acad. Sci. Hung.* **14**: 131-134 (1958). C63,999/58

In cats and dogs, the corticoid concentration in the adrenal venous blood rose considerably after surgical removal of the amygdaloid nuclei and the periamygdaloid cortical areas. These animals showed neither rage nor sexual reactions but an extreme reduction in activity and in resistance to emotional stimuli.

Mason, J. W.: "Plasma 17-hydroxycorticosteroid levels during electrical stimulation of the amygdaloid complex in conscious monkeys." *Am. J. Physiol.* **196**: 44-48 (1959). C63,562/59

In unanesthetized rhesus monkeys, electric stimulation of the amygdaloid complex invariably caused substantial elevations of plasma 17-OHCS levels, while no rises were observed during stimulation of the putamen (22 refs.).

Endrőczi, E., Lissák, K., Bohus, B., Kovács, S.: "The inhibitory influence of archicortical structures on pituitary-adrenal function." *Acta Physiol. Acad. Sci. Hung.* **16**: 17-22 (1959). C77,912/59

In cats, rabbits, dogs and rats, electric stimulation of the amygdaloid nucleus increases ACTH secretion, whereas under

similar conditions stimulation of the hippocampus inhibits the rise in ACTH release characteristic of stress (electroshock, EP, histamine, formalin). ACTH activity is estimated by adrenal ascorbic acid, corticoid content of adrenal venous blood, and lymphopenia.

Yamada, T., Greer, M. A.: "The effect of bilateral ablation of the amygdala on endocrine function in the rat." *Endocrinology* **66**: 565-574 (1960). C84,079/60

In rats, bilateral electrolytic destruction of the amygdala does not significantly interfere with TTH or ACTH secretion, but gonadotrophin production is definitely reduced. The amygdalectomized rats become adipose and aphagic. [The published curve showed a transitory rise of adrenal weight after the operation, and there was definite thymus involution, but this might have been a non-specific stress manifestation (H.S.).]

Bovard, E. W., Gloor, P.: "Effect of amygdaloid lesions on plasma corticosterone response of the albino rat to emotional stress." *Experientia* **17**: 521-523 (1961).

D14,959/61

Destruction of the central nucleus of the amygdala increases plasma corticosterone in the rat exposed to brief periods of restraint. It is suggested that separate inhibitory and facilitatory mechanisms for the pituitary-adrenocortical response to stress exist in the amygdaloid complex.

Slusher, M. A., Hyde, J. E.: "Alteration of adrenal effluent corticoid levels following forebrain stimulation in cats." *J. Clin. Endocrinol. Metab.* **21**: 100 (1961). D6,490/61

In cats, stimulation of lateral amygdala or rostral midline structures decreased the corticoid content of adrenal venous blood, whereas stimulation of the medial amygdala or hypothalamus induced rises. Stimulation of the hippocampus caused decreases in some cats and increases in others. [The brief abstract is difficult to evaluate (H.S.).]

Slusher, M. A., Hyde, J. E.: "Effect of limbic stimulation on release of corticosteroids into the adrenal venous effluent of the cat." *Endocrinology* **69**: 1080-1084 (1961).

D15,597/61

In cats with "encéphale isolé," adrenal venous corticoid levels decreased significantly after stimulation of the uncus, the lateral amygdala, the preoptic region, the diagonal band of Broca, or the septum. On the other hand, corticoid levels rose after stimulation

of the hippocampus or anterior medial amygdala. "The limbic system would appear to contain separate components functionally related to inhibition or facilitation of ACTH release."

Gunne, L. M., Reis, D. J.: "Changes in brain catecholamines associated with electrical stimulation of amygdaloid nucleus." *Life Sci.* **2**: 804-809 (1963). E36,459/63

In unanesthetized rats, intermittent electric stimulation of the right amygdaloid nucleus caused autonomic behavioral defense reactions and a decrease in NEP in the left hemisphere of the brain, while brain dopamine was unaffected. There was a decrease of EP and NEP in the adrenals.

Eleftheriou, B. E., Zolovick, A. J., Pearse, R.: "Effect of amygdaloid lesions on pituitary-adrenal axis in the deer mouse." *Proc. Soc. Exp. Biol. Med.* **122**: 1259-1262 (1966). F72,633/66

In the deer mouse, lesions in the medial amygdaloid complex increased plasma ACTH and corticosterone levels within twelve hours, presumably by eliminating an inhibitory effect.

McHugh, P. R., Smith, G. P.: "Plasma 17-OHCS response to amygdaloid stimulation with and without afterdischarges." *Am. J. Physiol.* **212**: 619-622 (1967). F78,351/67

In conscious rhesus monkeys, electric stimulation of the amygdaloid complex evoked afterdischarges and increased the plasma 17-OHCS concentration. Comparable stimuli which did not elicit afterdischarges had no effect on plasma 17-OHCS.

Matheson, G. K., Branch, B. J., Taylor, A. N.: "Facilitation and inhibition of ACTH release with amygdaloid stimulation in conscious cats." *Physiologist* **12**: 296 (1969).

H16,139/69

Various amygdaloid nuclei have different effects on ACTH release.

Matheson, G. K., Branch, B. J., Taylor, A. N.: "Effects of amygdaloid stimulation on pituitary adrenal activity in conscious cats." *Brain Res.* **32**: 151-167 (1971).

H73,938/71

In conscious cats with implanted electrodes, "facilitation of ACTH release, as determined by changes in plasma levels of cortisol and corticosterone, occurred primarily in response to stimulation of the corticomedial, basal and lateral amygdaloid nuclei; inhibition, primarily upon stimulation of the

corticomedial nuclei. The basal nuclear group also exerted differential inhibitory effects on corticosterone, while the major effect of anterior amygdaloid stimulation was no change in both steroids." The direction of ACTH response was directly related to the existing level of pituitary-adrenal activity; when this was low, stimulation caused facilitation of ACTH release, whereas inhibition occurred when the initial levels were high. Thus, the amygdala is a potent modulator of pituitary-adrenal activity. The literature on the neural regulation of ACTH secretion is carefully reviewed and criticized (33 refs.).

Winson, J., Gerlach, J. L.: "Stressor-induced release of substances from the rat amygdala detected by the push-pull cannula." *Nature [New Biol.]* **230**: 251-253 (1971). G83,348/71

Zolovick, A. J.: "Effects of lesions and electrical stimulation of the amygdala on hypothalamic-hypophyseal regulation." In: Eleftheriou, B. E., *The Neurobiology of the Amygdala*, pp. 643-683. New York and London: Plenum Press, 1972 (more than 150 refs.). J17,218/72

Leppäläluoto, J.: "Electrical stimulation of human thalamic and amygdaloid area and plasma cortisol concentration." *Acta Physiol. Scand.* **89**: 187-191 (1973). J8,407/73

In five patients, electric stimulation of the thalamus and amygdala by electrodes (chronically implanted for the treatment of psychomotor seizures) caused bursts of plasma cortisol (indwelling catheters). However, similar rapid changes in plasma cortisol were also observed in normal controls, and hence "no conclusion about the function of the pituitary-adrenal cortex axis in relation to electrical stimulation of thalamus or amygdala was drawn."

Allen, J. P., Allen, C. F.: "Role of the amygdaloid complexes in the stress-induced release of ACTH in the rat." *Neuroendocrinology* **15**: 220-230 (1974). H91,996/74

Plasma corticosterone determinations in the rat "suggest that the amygdalae facilitate rather than directly transmit neurogenic stress-induced signals (leg break) but not signals from systemic stresses (ether)." However, "bilateral paired amygdaloid lesions blocked the effect of the leg break but not of ether or tourniquet. Bilateral paired lesions between the lateral hypothalamic area and the amygdalae also blocked the effect of the leg break but not ether or tourniquet, whereas

bilateral lesions in the anterior portion of the striae terminali did not block the leg-break effect."

Brain Stem

(See also our earlier stress monographs, p. xiii)

Moll, J.: "Localization of brain-stem lesions inhibiting compensatory adrenal hypertrophy following unilateral adrenalectomy." *Z. Zellforsch. Mikrosk. Anat.* **49**: 515-524 (1959). C67,656/59

Slusher, M. A.: "Effect of brainstem lesions on stress-induced corticosteroid release in female rats." *Endocrinology* **67**: 347-352 (1960). C90,692/60

In rats five days after unilateral adrenalectomy and brain stem lesions, adrenal corticoids were measured following laparotomy. "At the rostral pons level, dorsal as well as ventral tegmental lesions were associated with high initial (0-15 minutes) release levels of corticosteroids into the adrenal venous effluent. Dorsal tegmental lesions were associated with an augmented corticosteroid release following acute stress while ventral tegmental lesions inhibited this response. Neither lesion site significantly altered compensatory adrenal hypertrophy."

Egdahl, R. H.: "The effect of brain removal, decortication and mid brain transection on adrenal cortical function in dogs." *1st Int. Congr. Endocrinology*, pp. 49-50. Copenhagen, 1960. J12,258/60

Comparative studies on dogs with complete bilateral decortication, brain removal, spinal cord and midbrain transection. The high resting corticoid outputs after midbrain transection suggest that cerebral inhibition of some hindbrain factor-releasing area is effected through nervous, and not humoral, pathways. "Adrenal cortical responses to nerve stimulation are less than maximal in these animals, and this would seem to indicate that it is the hind brain center rather than the hypothalamic one which has been activated to result in ACTH release." [The brief abstract does not lend itself to critical evaluation (H.S.).]

Slusher, M. A., Hyde, J. E.: "Effect of diencephalic and midbrain stimulation on ACTH levels in unrestrained cats." *Am. J. Physiol.* **210**: 103-108 (1966). F59,593/66

In unrestrained cats with chronically implanted electrodes, "measurable ACTH was released 1-2 min after stimulation of sites in dorsal midbrain, or four of eight sites in diencephalon; 30 min later, levels were again below the minimum detectable. Inhibition of the pituitary-adrenal axis was demonstrated by paired stimulation of a potentially inhibitory site with a demonstrably facilitative one: diencephalically evoked release of ACTH was blocked by concurrent stimulation of sites in the ventral midbrain or the preoptic region."

Zigmund, R. E., Schon, F., Iversen, L. L.: "Increased tyrosine hydroxylase activity in the locus coeruleus of rat brain stem after reserpine treatment and cold stress." *Brain Res.* **70**: 547-552 (1974). J11,658/74

Cerebrum, Brain in General

(See also our earlier stress monographs, p. xiii)

Scarf, J. E.: "Reaction to life stresses following unilateral prefrontal lobectomy or lobotomy." In: Wolff, H. G., Wolf, S. G. Jr. et al., *Life Stress and Bodily Disease*, pp. 121-126. Baltimore: Williams & Wilkins, 1950. B51,899/50

Egdahl, R. H., Story, J. L., Melby, J. C.: "Effect of progressive removal of the brain on adrenal cortical hypersecretion due to operative trauma." *Fed. Proc.* **17**: 435 (1958). H22,039/58

The rise in 17-OHCS produced by surgical trauma in the adrenal vein of the dog was not prevented by progressive removal of brain parts down to the hypothalamus, but disappeared after extirpation of the latter.

Egdahl, R. H.: "Adrenal cortical and medullary responses to trauma in dogs with isolated pituitaries." *Endocrinology* **66**: 200-216 (1960). J11,920/60

In dogs the urinary 17-OHCS content was raised for about five days after removal of the brain above the inferior colliculus. The dogs responded to burns with a further increase. Catecholamine levels were low, but rose after burns.

Egdahl, R. H.: "Corticosteroid secretion following caval constriction in dogs with isolated pituitaries." *Endocrinology* **68**: 226-231 (1961). J12,285/61

In dogs, partial constriction of the thoracic inferior vena cava strongly stimulates ACTH secretion, even after removal of the entire brain, which totally isolates the pituitary from its cerebral connections. The resting control 17-OHCS output is above normal even in decerebrated dogs.

Egdahl, R. H.: "Further studies on adrenal cortical function in dogs with isolated pituitaries." *Endocrinology* 71: 926-935 (1962). D45,363/62

In dogs, removal of the brain down to the pons and preparation of "hypothalamic islands," as well as ablation of the entire brain and spinal cord, depressed adrenal cortical function at first and then elevated the resting secretion. Removal of the posterior pituitary or abdominal evisceration did not alter this response.

Wise, B. L., Brunt, E. E. van, Ganong, W. F.: "Effect of removal of various parts of the brain on ACTH secretion in dogs." *Proc. Soc. Exp. Biol. Med.* 112: 792-795 (1963). D61,018/63

In dogs, 17-OHCS output in adrenal venous blood following trauma was slightly decreased after ablation of all brain tissue above the pons except the hypothalamus. The output was significantly lowered, but still above basal levels, after removal of the entire brain above the pons. Acute section of the pituitary stalk decreased the corticoid response to approximately the same degree. Hypophysectomy plus removal of the brain reduced output to very low levels. "These data do not support the hypothesis that the hindbrain secretes a factor which stimulates the pituitary to secrete ACTH."

Wise, B. L., Brunt, E. E. van, Ganong, W. F.: "Effect of brain removal in dogs previously subjected to pituitary stalk section." *Proc. Soc. Exp. Biol. Med.* 116: 306-310 (1964). F14,878/64

In dogs, transection of the pituitary stalk does not prevent 17-OHCS secretion into the adrenal venous blood. Following subsequent brain removal, 17-OHCS output is elevated and all neurohypophyseal tissue below the plastic plate separating the stalk becomes atrophic, but the adrenals retain their normal size. "The results suggest that the stress response in severely stressed dogs is not due entirely to CRF from the hypothalamus, and may be due in part to an ACTH-stimulating humoral agent liberated from traumatized tissues."

Matheson, G. K.: "Aspects of forebrain regulation of plasma glucocorticoids." *Diss. Abstr.* 30: 470B (1969). J11,477/69

Doctoral dissertation on the effect of electrically stimulating various forebrain regions of the rhesus monkey by chronically-implanted electrodes. As regards corticoid secretion, "the facilitatory loci were: the basal, accessory basal and lateral basal amygdaloid nuclei; the lateral hypothalamus (tuberal level); the fibers of the direct amygdalo-hypothalamic pathway; and the anterior commissure. Inhibitory loci were: the cortical, medial and anterior amygdaloid nuclei; fibers from the insular cortex; the stria terminalis and the olfactory area between the preoptic and anterior hypothalamic areas and the amygdala. Neutral areas were: the globus pallidus, the optic tract, the zona incerta and the subthalamus."

Kawakami, M., Kimura, F., Yoshida, K., Yanase, M., Seto, K.: "Reorganization of the brain mechanisms on the response to the repeated stress." *J. Physiol. Soc. Jap.* 32: 727-747 (1970) (Japanese). J21,406/70

Papaikonomou, E., Smelik, P. G.: "Evidence for derivative control in the rat pituitary-adrenal system." *Am. J. Physiol.* 227: 137-143 (1974). J10,731/74

In Nembutal-anesthetized rats with a carotid artery cannulated and one adrenal exposed, the plasma corticosterone level was fairly constant, but after removal of one adrenal it started to oscillate with periods of ten or twelve minutes. Similar oscillations were found when the blood from one adrenal was delayed on its way to the systemic circulation by about twenty-four minutes. In hypophysectomized rats receiving constant ACTH infusions, as well as in rats with corticosterone implants in the hypothalamus, unilateral adrenalectomy caused no such oscillations. The authors assume "the existence of a derivative controller, probably located in the brain, which is sensitive for negative rates of change in blood levels of corticosterone."

Cortex

(See also our earlier stress monographs, p. xiii)

Ferguson, R. W., Folkow, B., Mitts, M. G., Hoff, E. C.: "Effect of cortical stimu-

lation upon epinephrine activity." *J. Neurophysiol.* **20**: 329-339 (1957). C37,699/57

In cats, electric stimulation of the anterior sigmoid gyri greatly increased EP secretion, whereas stimulation of the cortical vasodepressor areas actually diminished it. "In electrode positions permitting stimulation of corticofugal fibers in the internal capsule, it was possible to differentiate loci giving blood pressure rise plus contraction of the denervated nictitating membrane from closely adjacent loci evoking pressor response with relaxation of the membrane. This is interpreted to mean that vasomotor and adrenal medullary secretory response may be mediated by discrete pathways from the cortex" (15 refs.).

Endrőczi, E., Kovács, S., Bohus, B.: "Changes in behavior and endocrine activation in response to the stimulation of orbito-frontal cortical areas." *Acta Physiol. Acad. Sci. Hung.* **14**: 39-44 (1958). C59,559/58

In rats, stimulation of the orbito-frontal cortical areas with chronically implanted electrodes elicited effective defensive and escape reactions, invariably accompanied by activation of the pituitary-adrenal cortical system. The most intense reactions were elicited from the paramedian areas of the posterior orbital cortex.

Euler, U. S. von, Folkow, B.: "The effect of stimulation of autonomic areas in the cerebral cortex upon the adrenaline and noradrenaline secretion from the adrenal gland in the cat." *Acta Physiol. Scand.* **42**: 313-320 (1958). C54,880/58

In cats, stimulation of certain autonomic areas in the cerebral cortex causes selective changes in the EP secretion of the adrenal medulla. Inhibition is obtained most consistently upon stimulation of ventral parts of the cerebral cortex, whereas NEP release is but slightly affected.

Egdahl, R. H.: "Cerebral cortical inhibition of pituitary-adrenal secretion." *Endocrinology* **68**: 574-581 (1961).

J12,284/61

In bilaterally decorticated dogs, 17-OHCS output into the adrenal blood was markedly elevated under ordinary conditions. "Sciatic nerve stimulation in the anesthetized decorticated animal resulted in a significant adrenal cortical response which was not further increased by exogenous ACTH. These studies indicate that the cerebral cortex exerts a tonic inhibition on lower central nervous sys-

tem areas which are involved in the control of ACTH release."

G89,354/72

Newborn rhesus monkeys delivered by Cesarean section and then exposed to various stressors showed stereotyped chemical changes in the brain. "It is proposed that the release of intracellularly bound cations is a result of their displacement from their binding sites by NH₄⁺ which is released to, and recovered from, these cation binding sites by a glutamate-glutamine interconversion. It is concluded that the apparent organized 'shutdown' of the cortical cells in response to acute stress may contribute to the relative insensitivity of this area of the brain to permanent histopathological damage."

Corticotrophin-releasing Factor (CRF)

(See also our earlier stress monographs, p. xiii)

Hume, D. M.: "The role of the hypothalamus in the pituitary-adrenal cortical response to stress." *J. Clin. Invest.* **28**: 700 (1949).

B33,420/49

Brief abstract of observations suggesting that certain hypothalamic extracts produce eosinopenia in both normal animals and in those with lesions in the anterior hypothalamus which make them unable to respond to stressors by eosinopenia. It is assumed that a mechanism located in the anterior hypothalamus elicits a substance capable of causing increased ACTH secretion during stress. [The particular region in the "anterior hypothalamus" has not been further identified in this brief abstract (H.S.).]

Groot, J. de, Harris, G. W.: "Hypothalamic control of the anterior pituitary gland and blood lymphocytes." *J. Physiol. (Lond.)* **111**: 335-346 (1950). B54,598/50

"Electrical stimulation of the posterior region of the tuber cinereum or of the mammillary body, of unanaesthetized, unrestrained rabbits resulted in a lymphopenia, which was similar in time relations and magnitude to that following an emotional stress stimulus." This response was not abolished by cervical sympathectomy and could not be duplicated by stimulation of other hypothalamic areas. A similar psychogenic stress lymphopenia was abolished by lesions in the zona tuberalis and by transverse lesions in the posterior tuber cinereum or mammillary body, but not by lesions in the pars distalis and pars intermedia, or by interruption of the infundibular stem. It is concluded that stress-induced ACTH secretion "is under neural control via the hypothalamus and the hypophysial portal vessels of the pituitary stalk." [This is the first clearcut demonstration of the hypothalamic regulation of stress-induced ACTH secretion (H.S.).]

Saffran, M., Schally, A. V., Benfey, B. G.: "Stimulation of the release of corticotropin from the adenohypophysis by a neurohypophysial factor." *Endocrinology* **57**: 439-444 (1955). C8,454/55

"Posterior pituitary extracts contain a corticotropin-releasing factor (CRF) that stimulates the release of ACTH from rat anterior pituitary tissue in vitro." CRF can be separated from vasopressin, and its activity is enhanced by NEP.

Guillemin, R., Rosenberg, B.: "Humoral hypothalamic control of anterior pituitary: a study with combined tissue cultures." *Endocrinology* **57**: 599-607 (1955). C9,787/55

If the dog or rat adenohypophysis is cultured in roller tubes, ACTH activity in the fluid medium disappears after the first four days, despite excellent growth and differentiation of the pituitary outgrowth. When explants of hypothalamus or ME are added to such cultures, the surrounding medium contains no histamine, acetylcholine, EP, NEP, 5-HT, oxytocin or vasopressin, but ACTH activity is demonstrable. "There exists some hypothalamic hypophysiotropic mediator involved in ACTH release, which is different from the above mentioned substances."

Porter, J. C., Rumsfeld, H. W. Jr.: "Effect of lyophilized plasma and plasma fractions from hypophyseal-portal vessel blood on adrenal ascorbic acid." *Endocrinology* **58**: 359-364 (1956). C12,745/56

Lyophilized extracts of hypothalamic venous plasma from dogs injected into cortisol-treated or hypophysectomized rats caused adrenal ascorbic acid depletion in the latter. "The active substance is either a large protein molecule or is bound to a large protein and is probably not identical with vasopressin."

Schapiro, S., Marmorston, J., Sobel, H.: "Pituitary stimulating substance in brain blood of hypophysectomized rat following electric shock 'stress.'" *Proc. Soc. Exp. Biol. Med.* **91**: 382-386 (1956) (18 refs.).

C14,584/56

Porter, J. C., Jones, J. C.: "Effect of plasma from hypophyseal-portal vessel blood on adrenal ascorbic acid." *Endocrinology* **58**: 62-67 (1956). J11,918/56

Plasma obtained from the hypophyseal-portal veins of hypophysectomized dogs decreased the adrenal ascorbic acid content in cortisol-overdosed rats, but not in hypophysectomized rats. "These observations suggest that blood from the hypophyseal portal vessels contains a substance(s) which accelerates the release of ACTH from the anterior lobe. These observations further suggest that a block in the response of the rat to the stress of unilateral adrenalectomy occurs at some site other than the anterior lobe, perhaps the hypothalamus."

Guillemin, R., Hearn, W. R., Cheek, W. R., Housholder, D. E.: "Control of corticotrophin release: further studies with in

vitro methods." *Endocrinology* **60**: 488-506 (1957). C32,056/57

A substance has been isolated from the hypothalamus and posterior pituitary of the hog and cattle in the form of a small peptide, "different from vasopressin, oxytocin, ACTH, histamine, acetylcholine, adrenalin, nor-adrenalin and 5-hydroxytryptamine" in its pharmacologic and chromatographic characteristics. "The in vitro ACTH-releasing activity was also observed in a fraction of Substance P of gut origin and possibly in extracts of brain cortex."

Clayton, G. W., Bell, W. R., Guillemin, R.: "Stimulation of ACTH-release in humans by non-pressor fraction from commercial extracts of posterior pituitary." *Proc. Soc. Exp. Biol. Med.* **96**: 777-779 (1957).

C48,445/58

The in vitro release of ACTH from rat pituitaries is not very specific, and may be obtained with various substances which merely produce passive leakage.

Garilhe, M. P. de, Gros, C., Chauvet, J., Fromageot, C., Mialhe-Voloss, C., Benoit, J.: "Nouvelles données concernant l'existence d'une hypophysostimuline à effet corticotrope" (New data related to the existence of a hypophyseal stimulant with a corticotrophic effect). *Biochim. Biophys. Acta* **29**: 603-611 (1958). C57,765/58

Saffran, M., Schally, A. V.: "An in vitro system for the study of the neural control of ACTH secretion." In: Curri, S. B. and Martini, L., *Pathophysiologia Diencephalica*, pp. 780-783. Wien: Springer-Verlag, 1958.

D94,108/58

In vitro studies on rat pituitaries revealed that "the release of ACTH is increased to a minor extent by epinephrine and norepinephrine. Hypothalamus, brain cortex, and posterior pituitary tissue have little, if any, influence by themselves, but in combination with norepinephrine, these tissues stimulate the release of ACTH. The greatest effect is exerted by the posterior lobe. The active material in the posterior lobe seems to be similar to, but distinct from, the beef posterior lobe principles, oxytocin and vasopressin."

Eik-Nes, K. B., Brizzee, K. R.: "Some aspects of corticotrophin secretion in the

trained dog. I. The presence of a corticotrophin releasing factor in the blood stream of dogs shortly after hypophysectomy." *Acta Endocrinol.* **29**: 219-223 (1958).

C59,055/58

In dogs the peripheral blood contains large amounts of CRF during the first week after hypophysectomy, presumably because the stress of survival after this operation stimulates its production.

Leeman, S. E., Munson, P. L.: "In vivo system for detection of the neural hormone responsible for ACTH secretion in stress." *Fed. Proc.* **17**: 387 (1958). C51,861/58

In rats, blockade of ACTH secretion by morphine is used as a basis for the bioassay of CRF.

Acad. Sci. (Paris)* **249**: 2234-2236 (1959).
J12,256/59

By use of countercurrent distribution, it was possible to isolate from pig posterior pituitaries a polypeptide with strong CRF and no vasopressor potency.

Saffran, M.: "Activation of ACTH release by neurohypophysial peptides." Symp. on Neurosecretion. First Annual Meeting Can. Fed. Biol. Soc., Kingston, June, 1958. *Can. J. Biochem. Physiol.* **37**: 319-329 (1959).
C63,550/59

Vasopressin, oxytocin and CRF can release ACTH from adenohypophyseal tissue in vitro. Presumably in rats, "the ability to promote the release of ACTH is a property shared by a family of substances, rather than a property of a unique neurohormone" (43 refs.).

Rochefort, G. J., Rosenberger, J., Saffran, M.: "Depletion of pituitary corticotrophin by various stresses and by neurohypophysial preparations." *J. Physiol.* **146**: 105-116 (1959).
C67,709/59

In rats, various stressors (sound, histamine, cold) differ in the intensity and speed with which they deplete the anterior or posterior pituitary of its ACTH content; hence

the differentiation between "neurogenic" and "systemic" stressors appears to be justified. CRF causes a prompt and sustained fall in the ACTH content of the anterior pituitary, with only a momentary dip at sixty minutes in the posterior lobe. Commercial and synthetic vasopressin preparations are less effective than CRF; hence the latter is presumably the physiologic releasing substance. Pretreatment with cortisol decreases but does not abolish the sensitivity of the anterior lobe to CRF.

Guillemin, R., Dear, W. E., Nichols, B. Jr., Lipscomb, H. S.: "ACTH releasing activity in vivo of a CRF preparation and lysine vasopressin." *Proc. Soc. Exp. Biol. Med.* **101**: 107-111 (1959) (14 refs.).

C97,961/60

Chemical characterization of two distinct CRF types which can be separated by chromatography. "In view of the discrepancy in the specific activities and preliminary amino-acid composition of the two substances, one might propose that β -corticotrophin-releasing factor is the true chemical mediator for release of adrenocorticotropic hormone, whereas α -corticotrophin-releasing factor is an α -melanocyte stimulating hormone analogue, possibly a precursor in the biosynthesis of adrenocorticotropic hormone."

Guillemin, R., Schally, A. V., Andersen, R. N., Lipscomb, H. S., Long, J. M.: "Sur l'existence de deux types de substances à activité hypophysiotrope" (On the existence of two types of substances with hypophysiotropic activity). *C.R. Acad. Sci. (Paris)* **250**: 4462-4464 (1960).
J12,257/60

Chromatographic separation of α -CRF, which exhibits weak adrenocorticotropic activity in vivo and in vitro and resembles α -MTH both in its polypeptide composition and chromatographic behavior. β -CRF is a polypeptide more closely resembling vasopressin and is fifty to one hundred times more potent as a corticotrophic releasing factor than α -CRF.

E3,939/64

Brief summary of evidence indicating that CRF is not identical with vasopressin.

Vernikos-Danellis, J.: "Estimation of corticotropin-releasing activity of rat hypothalamus and neurohypophysis before and after stress." *Endocrinology* **75**: 514-520 (1964).
F22,529/64

The CRF activity of posterior lobe extract is thought to be largely accounted for by vasopressin and is not measurable after acute stress. The CRF activity appears to be concentrated in the ME, and increases rapidly after stress (surgery under ether).

Ganong, W. F., Wise, B. L., Shackleford, R., Boryczka, A. T., Zipf, B.: "Site at which α -ethyltryptamine acts to inhibit the secretion of ACTH." *Endocrinology* **76**: 526-530 (1965).
F33,025/65

In dogs, α -ethyltryptamine decreased 17-OHCS output after surgical stress, even if most of the CNS was removed except for "hypothalamic islands." However, direct stimulation of the ME produced 17-OHCS secretion which could not be blocked by α -ethyltryptamine. Perhaps the compound "may prevent stimulation of the CRF-secreting neurons by impulses in the incoming afferent fibers." Although α -ethyltryptamine is a MAO inhibitor, its blockage of ACTH secretion is so transient that it seems unlikely to be related to MAO inhibition. Besides, other MAO inhibitors do not share this effect.

F35,942/65

Bovine ME extracts, continuously infused through the renal artery in young hypophysectomized rats with pituitary autografts in the kidney, produced ovarian follicles with enlargement of the adrenal and thyroid. This work furnishes "direct evidence that the hypothalamic neurohumors act not only as 'releasing' factors but also have tropic effects on many other phases of adenohypophysial function."

Vernikos-Danellis, J.: "Effect of rat median eminence extracts on pituitary ACTH content in normal and adrenalectomized rats." *Endocrinology* **76**: 240-245 (1965).
F31,470/65

In rats a single intracarotid injection of ME extract increased the ACTH content of the pituitary. This response was particularly marked after adrenalectomy. "It is concluded that the close similarity in the pattern of the changes in pituitary ACTH content after stress or after the administration of median eminence extracts suggests that the median eminence plays an important role in bringing about the changes in ACTH synthesis and secretion caused by stress."

McCann, S. M., Dhariwal, A. P. S.: "Hypothalamic releasing factors and the neurovascular link between the brain and the anterior pituitary." In: Martini, L. and Ganong, W. F., *Neuroendocrinology*, Vol. 1, pp. 261-296. New York and London: Academic Press, 1966. E6,487/66

Excellent review, wherein evidence indicating that the pituitary "is actually controlled by a new family of polypeptide neurohormones from the SME region is detailed. At present writing, it appears that the anterior lobe is controlled by six specific factors, one for each tropin secreted by the gland. Five of these factors cause the release of the tropin in question, while one, the PIF, inhibits release of prolactin. All of these factors appear to be small basic polypeptides dissimilar from the known neurohypophyseal hormones, vasopressin and oxytocin" (about 120 refs.).

F75,878/67

In hypophysectomized adult rats, five neonatal pituitaries implanted under the kidney capsule partially maintained adrenal weight, but the peripheral plasma corticosterone lev-

els were not significantly higher than in hypophysectomized controls. One hour after stress (ether, urethane, hemorrhage, restraint), significant elevations of peripheral plasma corticosterone were noted. The response to hemorrhage in the graft-bearing rats was inhibited by dexamethasone at very low dose levels ineffective in normal controls. Infusion of lysine vasopressin released corticotrophin from the grafts, but only at very high dose levels. "The results are ascribed to an accumulation of a physiological corticotrophin releasing factor in the peripheral circulation leading to a delayed release of corticotrophin from the grafts."

Arimura, A., Saito, T., Schally, A. V.: "Assays for corticotropin-releasing factor (CRF) using rats treated with morphine, chlorpromazine, dexamethasone and Nembutal." *Endocrinology* **81**: 235-245 (1967).

F87,059/67

Upon administration of CRF preparations from rat stalk ME, β -CRF, α -CRF and hypothalamic CRF, rats pretreated with chlorpromazine, morphine and Nembutal showed consistently greater rises in plasma corticosterone than those given dexamethasone, morphine and Nembutal. "This suggests a direct suppression of the CRF activity by dexamethasone." These and other observations also indicate that chlorpromazine + morphine + Nembutal-treated rats "have many advantages as a new assay preparation for CRF and can be used with greater ease and reliability."

E7,496/68

Résumé of the author's numerous publications concerning the diverse stimuli of pituitary-adrenocortical secretion (drugs, extremes of temperature, nervous stimulation, oligemia and so on). "Although most examples of inhibition of ACTH secretion may be explained on the basis of nervous pathways, it is difficult to interpret adrenal cortical hypersecretion in dogs with isolated pituitaries

without suggesting the existence of a CNS hormone inhibitory to pituitary ACTH secretion."

Schally, A. V., Arimura, A., Bowers, C. Y., Kastin, A. J., Sawano, S., Redding, T. W.: "Hypothalamic neurohormones regulating anterior pituitary function." *Rec. Prog. Horm. Res.* **24**: 497-588 (1968) (about 250 refs.). E8,349/68

Doepfner, W.: "The influence of neurohypophysial polypeptides on adenohypophysial function." In: Eichler, O., Farah, A. et al., *Handbuch der Experimentellen Pharmakologie*, Vol. XXIII, pp. 625-654. Berlin, Heidelberg and New York: Springer-Verlag, 1968. E7,707/68

Handbook article on the influence of hypothalamic-releasing factors upon anterior pituitary function, with special reference to ACTH secretion during stress (several hundred refs.).

Hiroshige, T., Sato, T., Ohta, R., Itoh, S.: "Increase of corticotropin-releasing activity in the rat hypothalamus following noxious stimuli." *Jap. J. Physiol.* **19**: 866-875 (1969). G73,482/69

In both intact and adrenalectomized rats, various stressors (vasopressin, EP, histamine, ether, laparotomy, formalin, noise, light) increased the CRF activity of the ME, as demonstrated by an intrapituitary microinjection method. There was considerable circadian variation in their response. Adrenalectomy itself caused no change in hypothalamic CRF (25 refs.).

Hiroshige, T., Sakakura, M., Itoh, S.: "Physiological significance of hypothalamic CRF in the regulation of ACTH secretion." *Gunma Symp. Endocrinol.* **6**: 231-247 (1969). H22,288/69

In rats, various stressors produced an increase in the CRF content of the hypothalamus (intrapituitary microinjection assay technique), although no such result was obtained with adrenalectomy. This is possibly due to autoinhibition by endogenous ACTH, since pretreatment with ACTH blocks the rise in CRF induced by ether anesthesia.

Bergland, R. M., Torack, R. M.: "An electron microscopic study of the human infundibulum." *Z. Zellforsch. Mikrosk. Anat.* **99**: 1-12 (1969). G69,072/69

EM observations on the human infundibulum (obtained for biopsy during hypophysectomy) "support other evidence that two

types of neural control are involved in anterior pituitary regulation, but a more precise correlation between structure and function is not possible. The vascular bed of the neural infundibulum is characterized by blood vessels whose structure ranks them with venules."

Brodish, A.: "Effect of hypothalamic lesions on the time course of corticosterone secretion." *Neuroendocrinology* **5**: 33-47 (1969). H19,454/69

"Increased corticosterone secretion was not detected in rats with hypothalamic lesions during the 2 h period following laparotomy, unilateral adrenalectomy, or cold stress (2°C). However, such animals did exhibit elevated levels of corticosterone in the plasma 4 h after the onset of the stress." This delayed hypersecretion of corticosterone was prevented by hypophysectomy or dexamethasone blockade. Treatment with multiple stressors (ether, cold, laparotomy, unilateral adrenalectomy) accelerated the corticosterone response. Apparently, in lesioned animals with endogenous CRF deficiency, a transient increase in ACTH secretion can be obtained two to four hours after the onset of stress. However, a rapid release of ACTH is produced in the rats with hypothalamic lesions when blood from hypophysectomized donors (which presumably contains much CRF) is injected.

Wied, D. de, Witter, A., Versteeg, D. H. G., Mulder, A. H.: "Release of ACTH by substances of central nervous system origin." *Endocrinology* **85**: 561-569 (1969).

G75,450/69

In rats in which blockade of ACTH secretion was attempted with pentobarbital, atropine, chlorpromazine, morphine, dexamethasone or posterior lobe extirpation, the ACTH-releasing effects of prostaglandin E, angiotensin II, arginine vasopressin, carbachol and so on were found to be active under some conditions and inactive under other conditions. However, "the anterior pituitary in vitro was the only assay system in which the crude CRF was the sole material which effectively triggered the release of ACTH."

Dhariwal, A. P. S., Russell, S. M., McCann, S. M., Yates, F. E.: "Assay of corticotropin-releasing factors by injection into the anterior pituitary of intact rats." *Endocrinology* **84**: 544-556 (1969). H10,012/69

In the rat, CRF is more active in provok-

ing ACTH release when given into the adenohypophysis than when introduced into the ME after pretreatment with dexamethasone, Nembutal or morphine.

Mulder, A. H., Geuze, J. J., Wied, D. de: "Studies on the subcellular localization of corticotrophin releasing factor (CRF) and vasopressin in the median eminence of the rat." *Endocrinology* 87: 61-79 (1970).

H25,067/70

Gradient centrifugation and EM studies in rats "suggest that the major part of both CRF and vasopressin is localized in nerve endings and stored in granules within these endings. However, the different localization patterns in the subfractions containing the synaptosomes may indicate that production, transport and release of CRF and vasopressin take place in separate neurones within the hypothalamus" (37 refs.).

Burgus, R., Guillemin, R.: "Hypothalamic releasing factors." *Annu. Rev. Biochem.* 39: 499-526 (1970). H27,402/70

Review on all hypothalamic releasing factors with a section on CRF (143 refs.).

Marks, B. H., Hall, M. M., Bhattacharya, A. N.: "Psychopharmacological effects and pituitary-adrenal activity." *Prog. Brain Res.* 32: 57-70 (1970). J11,401/70

The mechanism of CRF release was studied in rats by a technique whose main characteristics are described as follows: "Basically, median eminence fragments were extracted with acid. The lyophilized and reconstituted extracts were then incubated with pituitary halves from normal female donor rats. The ACTH released into the medium was biologically assayed by measuring its effect on the adrenal corticosterone content of dexamethasone-blocked assay rats. Within a limited range, the ACTH released is proportional to the amount of CRF in the incubation medium." When directly added to the latter, even large amounts of monoamines did not produce ACTH secretion, and hence alterations in monoamine content of the hypothalamus by drugs should not influence the results of CRF measurements. ACTH secretion was greatly enhanced by chlorpromazine and intraperitoneal reserpine in vivo. At the same time the CRF content of the ventral hypothalamus decreased markedly under the influence of these two drugs. In rats, treatment with pargyline (a MAO inhibitor) before reserpine increased the brain content of catecholamine and 5-

HT, and reversed the behavioral effects of reserpine. At the same time, it markedly reduced the burst of ACTH secretion in response to acute stressors (ether, laparotomy). On the basis of these and other observations, it is proposed that, "in the rat, psychopharmacologic agents may initiate marked and persistent changes in the rate of CRF release by acting upon neural mechanisms in the brain which control this process. Those drugs which produce cholinergic effects or which block central adrenergic activity increase the rate of CRF secretion. Those drugs which augment adrenergic activity or which block central cholinergic processes reduce the rate of CRF secretion."

Mess, B., Zanisi, M., Tima, L.: "Site of production of releasing and inhibiting factors." In: Martini, L., Motta, M. et al., *The Hypothalamus*, pp. 259-276. New York and London: Academic Press, 1970. J12,267/70

Review on the production of various adenohypophyseal hormone-releasing or release-inhibiting factors, among which the following are discussed:

Hypothalamic Factors

- Corticotropin Releasing Factor¹
- Fractions of CRF²
- Thyrotropin Releasing Factor³
- Luteinizing Hormone Releasing Factor⁴
- Growth Hormone Releasing Factor⁵
- Follicle-Stimulating Hormone Releasing Factor⁶
- Melanocyte-Stimulating Hormone Releasing Factor⁷
- Prolactin Releasing Factor (pigeon)⁸
- Prolactin Inhibiting Factor (mammals)⁹
- Melanocyte-Stimulating Hormone Inhibiting Factor¹⁰
- Growth Hormone Inhibiting Factor¹¹

(Reproduced from Martini, Motta et al., *The Hypothalamus* (1970), Table 1, p. 260, with permission of B. Mess et al. and Academic Press.)

There is good evidence that all of these factors originate in different but closely situated regions of the basal hypothalamus. However, "extrahypothalamic structures, belonging mainly to the limbic system (e. g. amygdala complex, habenular region, and hippocampus) or to the lower brain stem (e.g. reticular formation of the mesencephalon) might influence the rate of synthesis or release of these different hypothalamic mediators, either by direct or indirect neuronal connections with the hypophysiotropic area or by some indirect interglandular interplay."

Hiroshige, T., Sato, T.: "Postnatal development of circadian rhythm of corticotropin-releasing activity in the rat hypothalamus." *Endocrinol. Jap.* **17**: 1-6 (1970).

H27,251/70

In rats a circadian rhythm in plasma corticosterone, with a peak in the evening and a nadir in the morning, as well as concurrent circadian variations in the hypothalamic CRF content, become detectable only at about three weeks of age.

Hiroshige, T., Sato, T.: "Circadian rhythm and stress-induced changes in hypothalamic content of corticotropin-releasing activity during postnatal development in the rat." *Endocrinology* **86**: 1184-1186 (1970).

H25,238/70

In rats, the development of a circadian rhythm in CRF activity becomes evident between the fourteenth and twenty-first day of postnatal life, whereas responsiveness to stressors is manifest by the seventh day. "The hypothalamic CRF may at least be one of the rate-limiting phases in the mechanism of stress nonresponsiveness during the first few days of postnatal life in the rat."

Hiroshige, T., Sato, T.: "Changes in hypothalamic content of corticotropin-releasing

activity following stress during neonatal maturation in the rat." *Neuroendocrinology* **7**: 257-270 (1971). H42,531/71

Even fetal hypothalamic tissue exhibited an immediate increment of CRF after stress, but the plasma corticosterone rise was delayed, perhaps because of immaturity of the portal vessels. "Since the pituitary glands of the 2-day-old neonates contained ACTH, to which their own adrenals were quite responsive, it is most likely that inability of CRF release from the hypothalamus may be a cause of non-responsiveness to stress during this specific period. Furthermore, since a fetal response to stress as well as a day-1 neonatal responsiveness was clearly observed, it is probable that the day-2 neonatal non-responsiveness is a result of the previous activity associated with delivery and not a developmental rate limitation as suggested by others."

Hiroshige, T., Sato, T., Abe, K.: "Dynamic changes in the hypothalamic content of corticotropin-releasing factor following noxious stimuli: delayed response in early neonates in comparison with biphasic response in adult rats." *Endocrinology* **89**: 1287-1294 (1971).

H48,432/71

H47,039/71

In rats, dexamethasone blocks the stress-induced (surgery) rise in the CRF level of the ME and in the plasma corticosterone concentration. The pituitaries of dexamethasone-treated rats respond to ME extract in a normal manner. It is concluded that dexamethasone-induced inhibition acts mainly at or above the hypothalamic level.

Drzhevetskaia, I. A., Borodin, A. D.: "Corticotropin-releasing activity of rat hypothalamic extracts under stress conditions." *Patol. Fiziol. Éksp. Ter.* **15** Nos. 5-6: 42-45 (1971) (Russian).

J21,370/71

In rats, exposure to various stressors (ether, histamine, insulin) or uninephrectomy increased the CRF content of the hypothalamus during the alarm reaction, but this was followed by a decrease if the stress situation was prolonged.

Witorsch, R. J., Brodish, A.: "Evidence for acute ACTH release by extrahypotha-

lamic mechanisms." *Endocrinology* **90**: 1160-1167 (1972). H54,745/72

Following stress induced by laparotomy, ether or hemorrhage, the "rapid increases in plasma corticosterone in rats bearing ventral hypothalamic lesions, expanded hypothalamic lesions and pituitary islands provide evidence for the existence of extrahypothalamic pathways for acute ACTH release in rats."

Neuroendocrinology **10**: 1-22 (1972). H58,144/72

Péczely, P.: "Effect of ether stress on CRF-ACTH system of the domestic pigeon."
Acta Biol. Acad. Sci. Hung. **23**: 23-29 (1972). G99,695/72

"In 15 min after the stress, the CRF activity and the ACTH content of the pituitary gland decreased by 17 and 55 per cent, respectively, and the corticosterone production of the adrenals increased by 218 per cent."

Takebe, K., Sakakura, M.: "Circadian rhythm of CRF activity in the hypothalamus after stress."
Endocrinol. Jap. **19**: 567-570 (1972). J17,033/72

In intact, adrenalectomized, or hypophysectomized rats, the increment in the CRF content of the ME was greatest after ether stress at 08:00, and slightest at 18:30. The final poststress level was essentially the same, but the resting level was highest in the late afternoon. "Thus it is likely that the response of ACTH release to stimulus is not influenced by the diurnal rhythm of plasma corticoids or ACTH, but is related to other factors such as inherent neural sensitivity to stress."

Zarrow, M. X., Campbell, P. S., Denenberg, V. H.: "Handling in infancy: increased levels of the hypothalamic corticotropin releasing factor (CRF) following exposure to a novel situation."
Proc. Soc. Exp. Biol. Med. **141**: 356-358 (1972). H60,966/72

Observations on rats confirmed "previous findings that handled animals release less corticosterone than nonhandled animals when exposed to a novel environment.... A functionally different mechanism for release of CRF may exist as a result of infantile stimulation."

Seiden, G., Brodish, A.: "Persistence of a

diurnal rhythm in hypothalamic corticotrophin-releasing factor (CRF) in the absence of hormone feedback."
Endocrinology **90**: 1401-1403 (1972). H54,781/72

By use of an improved pituitary incubation method, "a diurnal rhythm of hypothalamic CRF activity in hypophysectomized rats was detected which parallels the rhythm found in intact rats. Absolute levels of hypothalamic CRF activity were higher in the hypophysectomized rats than in the intact rats at all times of the day tested." Although ACTH and/or corticoids influence the concentration of CRF, the diurnal rhythm of its activity is independent of hormonal feedback.

Nelson, D. H.: "Regulation of glucocorticoid release."
Am. J. Med. **53**: 590-594 (1972). G95,722/72

Résumé of the factors regulating glucocorticoid release during stress, with special emphasis upon the role of CRF.

Guillemin, R., Burgus, R.: "The hormones of the hypothalamus."
Sci. Am. **227**: 24-33 (1972). G95,674/72

Semipopular review on the releasing factors of the hypothalamus.

Hiroshige, T., Abe, K.: "Dynamics of activity of hypothalamic corticotropin releasing factor in the rat."
J. Physiol. Soc. Jap. **34**: 529-530 (1972). H79,788/72

In rats the circadian rhythm in hypothalamic CRF content (with a peak in the afternoon and a nadir in the morning) develops after two to three weeks of postnatal life, whereas responses to stress occur as early as the seventh day. The circadian rhythm persists in the absence of circulating corticosterone and hence appears to be dependent only upon nervous regulation, not upon negative feedback.

Lymangrover, J. R., Brodish, A.: "Tissue CRF: an extra-hypothalamic corticotrophin releasing factor (CRF) in the peripheral blood of stressed rats."
Neuroendocrinology **12**: 225-235 (1973). H67,204/73

In rats bearing extensive ventral hypothalamic lesions, extra-hypothalamic CRF activity was demonstrable in the blood.

Chowers, I., Siegel, R., Conforti, N., Feldman, S.: "Effect of acute neurogenic stress on hypothalamic corticotropin-releasing factor content."
Isr. J. Med. Sci. **9**: 1056-1058 (1973). H77,289/73

The stressor effect of sound (strong bell)

depletes the hypothalamic CRF considerably within four minutes, following a rapid initial rise. CRF was assayed by the in vitro pituitary incubation method.

Guillemin, R.: "Hypothalamic hormones: releasing and inhibiting factors." *Hosp. Pract.* November, 1973, pp. 111-120.

J13,316/73

Brief but excellent review of the history of CRF and other releasing factors, with illustrations and a description of present-day knowledge.

A review on the origin and nature of the various releasing factors, with special reference to a cAMP-dependent protein kinase in initiating the synthesis and discharge of adenohypophyseal hormones.

Brodish, A., Sakakura, M.: "Tissue-CRF: properties, secretion and action of a potent stimulator of the pituitary-adrenal system." *Fed. Proc.* 33: 206 (1974). H83,820/74

Tissue-CRF activity was detected in the blood of stressed rats (by infusion into rats with hypothalamic lesions), although it was relatively unstable at room temperature. It was also demonstrable in the plasma of hypophysectomized rats bearing hypothalamic lesions, and in these it increased for an even longer period after laparotomy.

Lymangrover, J. R., Brodish, A.: "Physiological regulation of tissue-CRF." *Neuroendocrinology* 13: 234-245 (1974).

H81,875/74

Intact rats generally show a transient but immediate discharge of ACTH after exposure to acute stress, with a return to

normal within two hours. This response, ascribed to CRF from the ME (ME-CRF), is usually not seen after hypothalamic lesions, but under certain conditions there is a delayed ACTH secretion two to four hours later due to tissue-CRF release from sites other than the hypothalamus. In rats with hypothalamic lesions, stressors (laparotomy, rapid injection of pooled plasma from heparinized ether-anesthetized donors) caused delayed ACTH secretion after two to eight hours. When ME-CRF or ACTH was administered at the time of exposure to the stressor, the delayed response was suppressed and plasma corticosterone remained near normal. In hypophysectomized, lesioned donor rats, laparotomy caused a delayed increase in the blood concentration of tissue-CRF, which could be suppressed by pretreatment with ACTH at the time of laparotomy. "Tissue-CRF may be released in conditions of severe stress when the hypothalamic-CRF mechanism is inadequate to provide the sustained elevated levels of pituitary-adrenal secretions in time of need."

Grant, G. F., Vale, W.: "Hypothalamic control of anterior pituitary hormone secretion. Characterized hypothalamic-hypophysiotropic peptides." *Curr. Top. Exp. Endocrinol.* 2: 37-72 (1974). J13,593/74

Review on the various hypothalamic-releasing and release-inhibiting factors in which CRF is barely mentioned (91 refs.).

Dallman, M. F., DeManincor, D., Shin-sako, J.: "Diminishing corticotrope capacity to release ACTH during sustained stimulation: the twenty-four hours after bilateral adrenalectomy in the rat." *Endocrinology* 95: 65-73 (1974). H88,113/74

Observations on rats given extracts of rat ME or hypothalamus at different intervals after bilateral adrenalectomy suggest that the triphasic curve in plasma ACTH normally seen after this operation is due to alterations in the capacity of the adenohypophysis to secrete ACTH during sustained stimulation of CRF. The findings agree with the assumption that CRF secretion increases a few minutes after adrenalectomy and remains high thereafter. However, following adrenalectomy or application of chronic stressors, the adenohypophysis has a transiently decreased capacity to release ACTH, despite the sustained rise in CRF secretion.

Csernus, V., Lengvári, I., Halász, B.: "Data on the localization of CRF-producing

neural elements." *Gen. Comp. Endocrinol.* **22:** 360 (1974). H83,188/74

In rats, adenohypophyseal tissue was implanted into different hypothalamic regions and then the pituitary was removed. ACTH secretion was estimated by plasma corticosterone levels and found to be raised only in those rats in which the implant was in contact with the ME. It is concluded that only the ME contains enough CRF to cause a significant ACTH secretion.

Cerebrospinal Fluid (CSF)

(See also our earlier stress monographs, p. xiii)

Myers, R. D., Sharpe, L. G.: "Cerebrospinal fluid production during temperature stress and feeding in the conscious monkey." *Experientia* **25:** 497-498 (1969).

H13,633/69

Various stressors increase CSF production.

Loon, G. R. van, Scapagnini, U., Cohen, R., Ganong, W. F.: "Effect of intraventricular administration of adrenergic drugs on the adrenal venous 17-hydroxycorticosteroid response to surgical stress in the dog." *Neuroendocrinology* **8:** 257-272 (1971).

H48,631/71

In dogs, intraventricular administration of several adrenergic drugs blocks 17-OHCS secretion in response to laparotomy. The same is true of the catecholamine precursor L-dopa and the MAO inhibitor α -ethyltryptamine. On the other hand, tyramine (which releases catecholamines from nerve endings) inhibits the 17-OHCS response when given intraventricularly but not when given systemically. "These data support our previously presented hypothesis that a central adrenergic neural system inhibits ACTH secretion in dogs."

Kendall, J. W., Jacobs, J. J., Kramer, R. M.: "Studies on the transport of hormones from the cerebrospinal fluid to hypothalamus and pituitary." In: Knigge, K. M., Scott, D. E. et al., *Brain-Endocrine Interaction. Median Eminence: Structure and Function*, pp. 342-349. Basel and New York: S Karger, 1972. E10,557/72

Studies in rats on the possible transport of hormones regulating adenohypophyseal function. "(1) CSF median eminence-pituitary transport was considered possible because radioactivity appeared in the median

eminence and pituitary promptly after injection of radioactive hormones into the ventricular system of rats. (2) The possibility of physiologically significant transport of TRH [thyrotrophin releasing hormone] in CSF was considered unlikely because TRH was no more effective in causing TSH secretion when administered in the lateral ventricle than in the saphenous vein of rats. (3) Previous studies of CSF transport of cortisol and thyroxin were reviewed and a general conclusion was made: in judging the significance of implantation experiments designed to localize sites of hormone effects in the brain, the possibility of transport of the hormone in CSF from the placement site to another receptor site must be considered."

Leonhardt, H., Eberhardt, H. G.: "Dye transport from the median eminence to the hypothalamic wall." In: Knigge, K. M., Scott, D. E. et al., *Brain-Endocrine Interaction. Median Eminence: Structure and Function*, pp. 335-341. Basel and New York: S Karger, 1972. E10,571/72

In rats, supravital dyes can pass from the blood vessels of the ME into the hypothalamic wall by way of the CSF. EM observations show that "the underlying tissue of the ependyma of the hypothalamic wall contains numerous large basement membranes which form a labyrinth of ramified extrusions. This labyrinth is also directed at the ventricle up to a distance of 1 μ ."

Diencephalon, Mesencephalon (Midbrain)

(See also our earlier stress monographs, p. xiii)

Hess, W. R.: *Functional Organization of the Diencephalon*, p. 40. New York: Grune & Stratton, 1957. E10,658/57

Newman, A. E., Redgate, E. S., Farrell, G.: "The effects of diencephalic-mesencephalic lesions on aldosterone and hydrocortisone secretion." *Endocrinology* **63:** 723-736 (1958). J12,363/58

In cats, destruction of the ventral diencephalon reduced, whereas transection of the midbrain reticular formation did not alter, aldosterone or cortisol secretion into the adrenal venous blood. An even greater reduction in aldosterone-cortisol levels was obtained by lesions in the reticular formation of the midbrain and caudal diencephalon. On the other hand, aldosterone secretion was

significantly increased without affecting cortisol release when the lesions extended into the rostral half of the pons.

Slusher, M. A., Critchlow, V.: "Effect of midbrain lesions on ovulation and adrenal response to stress in female rats." *Proc. Soc. Exp. Biol. Med.* **101**: 497-499 (1959).

C72,442/59

In female rats, coagulating lesions in the posterior portion of the midbrain and the level of rostral pons caused "increased corticosterone secretion into adrenal venous effluent in response to surgical stress. Lesions in posterior diencephalon and rostral midbrain structures resulted in depressed corticosterone secretion. Adrenal ascorbic acid response to stress was not correlated with corticosterone response. Ovulation was blocked in rats with brain lesions in any of these areas where concomitant mammillary peduncle damage was present."

Egdahl, R. H.: "The effect of brain removal, decortication and midbrain transection on adrenal cortical function in dogs." *1st Int. Congr. Endocrinology*, pp. 49-50. Copenhagen, 1960.

J12,258/60

Comparative studies on dogs with complete bilateral decortication, brain removal, spinal cord and midbrain transection. The high resting corticoid outputs after midbrain transection suggest that cerebral inhibition of some hindbrain factor-releasing area is effected through nervous, and not humoral, pathways. "Adrenal cortical responses to nerve stimulation are less than maximal in these animals, and this would seem to indicate that it is the hind brain center rather than the hypothalamic one which has been activated to result in ACTH release." [The brief abstract does not lend itself to critical evaluation (H.S.).]

Martini, L., Pecile, A., Saito, S., Tani, F.: "The effect of midbrain transection on ACTH release." *Endocrinology* **66**: 501-507 (1960).

C84,071/60

In rats, midbrain transection interferes with ACTH secretion during stress.

Suzuki, T., Romanoff, E. B., Koella, W. P., Levy, C. K.: "Effect of diencephalic stimuli on 17-hydroxycorticosteroid secretion in unanesthetized dogs." *Am. J. Physiol.* **198**: 1312-1314 (1960).

C90/173,60

In unanesthetized dogs, stimulation of the posterior hypothalamic or lower thalamic areas by implanted electrodes increases 17-OHCS secretion. Stimulation of the upper

posterior hypothalamic area or the area pre-optica causes only a slight rise in 17-OHCS release followed by a marked decrease to below normal. Stimulation of the capsula interna produces no change.

Endrőczi, E., Lissák, K.: "The role of the mesencephalon, diencephalon and archicortex in the activation and inhibition of the pituitary-adrenocortical system." *Acta Physiol. Acad. Sci. Hung.* **17**: 39-55 (1960).

C91,648/60

In cats and dogs, electric stimulation of the reticular formation and of the posterior hypothalamus caused changes in adrenocortical secretion similar to those elicited by chronic ACTH treatment. "Lesions of the septum affecting the afferent and efferent connections of the rhinencephalon considerably influenced the adrenocortical activity. As to the function of the archicortex, the existence of a modifying and inhibitory regulation was assumed, which manifests itself both in the behaviour of the animals and the activity of the pituitary-adrenocortical system."

Davis, J. O., Anderson, E., Carpenter, C. C. J., Ayers, C. R., Haymaker, W., Spence, W. T.: "Aldosterone and corticosterone secretion following midbrain transection." *Am. J. Physiol.* **200**: 437-443 (1961).

D2,868/61

In dogs, "complete midbrain transection does not interfere with the high rate of aldosterone secretion which occurs in response to acute blood loss or following caval constriction if venous pressure is maintained at the high control level."

Ahrén, C.: "Effects of diencephalic lesions on acute and chronic stress responses in male rabbits." *Acta Endocrinol. (Kbh.)* **41** Supp. 69: 1-92 (1962).

D38,126/62

Monograph on the effects of variously placed diencephalic lesions upon the stress response of rabbits given formalin subcutaneously. "The results indicate that the lymphopenic response was completely blocked by small, circumscribed lesions in the region of the dorsomedial and ventromedial nuclei as well as by lesions in the posterior border of the mammillary bodies and the region dorso-caudal thereto, whilst it remained unaffected by lesions in the premammillary area or in the anterior half of all the mammillary bodies. Lesions in the anterior preoptic area and posterior orbitofrontal cortex, in the ventro-caudal septum or in the anterior hypo-

lamic area dorsocaudal to the optic chiasm were associated with partial inhibition, and occasionally even with total blockage, of the lymphopenic response." The findings do not permit conclusions concerning any particular region which would represent a "center" of such stress responses in the limbic structures or mesencephalon.

Kendall, J. W. Jr., Allen, C., Greer, M. A.: "ACTH secretion in midbrain-transected rats." *Endocrinology* 77: 1091-1096 (1965). F58,070/65

In midbrain-transected rats, basal plasma corticosterone levels are high during the first two days postoperatively, and ether anesthesia induces them to rise even further. Dexamethasone suppresses plasma corticosterone in these animals as it does in normals. Apparently, both stimulatory and inhibitory influences can act on ACTH secretion after midbrain transection, and there is no evidence for a "tonic inhibitory neural center" in ACTH release.

Slusher, M. A., Hyde, J. E.: "Effect of diencephalic and midbrain stimulation on ACTH levels in unrestrained cats." *Am. J. Physiol.* 210: 103-108 (1966).

F59,593/66

In unrestrained cats with chronically implanted electrodes, "measurable ACTH was released 1-2 min after stimulation of sites in dorsal midbrain, or four of eight sites in diencephalon; 30 min later, levels were again below the minimum detectable. Inhibition of the pituitary-adrenal axis was demonstrated by paired stimulation of a potentially inhibitory site with a demonstrably facilitative one: diencephalically evoked release of ACTH was blocked by concurrent stimulation of sites in the ventral midbrain or the preoptic region."

Cross, B. A., Kitay, J. I.: "Unit activity in diencephalic islands." *Exp. Neurol.* 19: 316-330 (1967).

J11,315/67

Warburton, D. M.: "Modern biochemical concepts of anxiety. Implications for psychopharmacological treatment." *Int. Pharmacopsychiatry* 9: 189-205 (1974).

J21,388/74

In man, "corticosteroids produce agitation and enhance anxiety. It is proposed that anxiety results from the neurochemical changes induced by corticosteroids. Evidence was presented to show that the critical changes for anxiety are due to modifications

in serotonin pathways in the tegmental region of the midbrain."

Ependyma

(See also our earlier stress monographs, p. xiii, and cf. Median Eminence [ME], Tuber Cinereum)

Löfgren, F.: "New aspects of the hypothalamic control of the adenohypophysis." *Acta Morphol. Neerl. Scand.* 2: 220-229 (1959).

J12,061/59

In newborn rats the ependymal cells in the recessus infundibuli are "irregularly multilayered with a 'broken-up' appearance," and display interstices communicating with the recess which seem to carry colloid-like substances. Presumably they bear "secretory substances which are transported to the pars distalis via the cerebrospinal fluid and a glial-vascular chain."

Löfgren, F.: "The glial-vascular apparatus in the floor of the infundibular cavity. Further studies on the transport mechanism between the hypothalamus and the anterior pituitary." *Lunds Univ. Arsskrift* 57: 1-18 (1961).

D6,827/61

The peculiar type of glial and ependymal elements in the infundibular process might play a role in pituitary hormone secretion, as indicated by morphologic evidence.

Lévéque, T. F., Hofkin, G. A.: "Demonstration of an alcohol-chloroform insoluble, periodic acid-Schiff reactive substance in the hypothalamus of the rat." *Z. Zellforsch. Mikrosk. Anat.* 53: 185-191 (1961).

J12,876/61

"An alcohol-chloroform insoluble, periodic acid-Schiff reactive substance associated with the ependymal lining of the supraoptic and infundibular recesses was demonstrated in the hypothalamus of the white rat." This special ependyma is stratified, but contains long processes throughout the extent of the recess in which the PAS-reactive substance is present.

Vigh, B., Aros, B., Wenger, T., Koritsán-szky, S., Ceglédi, G.: "Ependymosecretion (ependymal neurosecretion). IV. The Golmori positive secretion of the hypothalamic ependyma of various vertebrates and its relation to the anterior lobe of the pituitary." *Acta Biol. Acad. Sci. Hung.* 13: 407-419 (1963).

J12,756/63

The Gomori-positive substance in certain regions of the ependyma in the third ventricle of various species represents an "ependymo-secretion" or "ependymal neurosecretion" and is probably "an important factor in the correlation between hypothalamus and anterior pituitary."

Kumar, T. C. A.: "Sexual differences in the ependyma lining the third ventricle in the area of the anterior hypothalamus of adult rhesus monkeys." *Z. Zellforsch. Mikrosk. Anat.* **90**: 28-36 (1968).

J12,543/68

Sexual differences in the tanycyte ependyma in contact with the ME furnish additional evidence supporting the view that these cells play an important role in the regulation of adenohypophyseal function.

Kumar, T. C. A.: "Modified ependymal cells in the ventral hypothalamus of the rhesus monkey and their possible role in the hypothalamic regulation of anterior pituitary function." *J. Endocrinol.* **41**: xvii-xviii (1968).

H2,338/68

Description of special ependymal cells lining the ventral hypothalamus which contain argyrophilic and PAS-positive granules and processes extending toward the ME. Their ultrastructure also suggests endocrine activity. They become degranulated after ovariectomy, this being prevented by estrogen treatment. These cells show morphologic changes related to sexual maturity and the menstrual cycle. "The observations made in this study suggest a possible role for these glandular cells in the hypothalamic regulation of anterior pituitary function."

Duvernoy, H., Koritke, J. G.: "Les vaisseaux sous-épendymaires du recessus hypophysaire" (Subependymal vessels of the hypophyseal recessus). *J. Hirnforsch.* **10**: 227-245 (1968).

J12,676/68

Extensive histologic studies on the subependymal origins of the hypothalamo-adeno-hypophyseal portal vessels in various mammals and birds. There exist numerous connections between the subependymal vessels and the cavity of the third ventricle from which they are separated only by a thin and often discontinuous ependymal membrane. "Such a structure will possibly allow exchanges between the blood of the hypophysis and the ventricular liquid which is continuously in motion in the third ventricle."

Knigge, K. M., Scott, D. E.: "Structure

and function of the median eminence." *Am. J. Anat.* **129**: 223-244 (1970).

G78,982/70

Mainly on the basis of ME studies, the authors question the view that all neurosecretory cells concerned with releasing factors are restricted to a small region of the basal hypothalamus and transport their products through axons ending in the contact zone of the ME. "Terminals of the arcuate-tuberoinfundibular system contain populations of clear and dense-core vesicles which have been associated with acetylcholine by morphological inference and some physiological data, with catecholamines by morphological and histochemical correlates, and with releasing hormones largely by physiological studies for which acceptable alternate hypotheses appear possible. The arcuate-tuberoinfundibular fibers contain significant dopaminergic fibers whose role in median eminence function requires elucidation. From morphological criteria, ependymal cells (tanycytes) appear to serve some role which functionally links cerebrospinal fluid of the third ventricle and blood of the primary pituitary portal plexus, this role may be the extraction and transport of some releasing hormones placed in the cerebrospinal fluid at sites distant from the median eminence."

Weindl, A., Joynt, R. J.: "The median eminence as a circumventricular organ." In: Knigge, K. M., Scott, D. E. et al., *Brain-Endocrine Interaction. Median Eminence: Structure and Function*, pp. 280-297. Basel and New York: S Karger, 1972.

E10,569/72

EM studies on the cat, monkey, rat and rabbit suggest that ependymal cells in the ME and organum vasculosum of the lamina terminalis and the area postrema have several unique cytologic features in common. In both, the nonciliated ependymal cells possess long basal processes which are rich in microfilaments and end in the peripheral basal lamina of the perivascular space. "Segregation of homogeneous material from the apical surface of ependymal cells and discharge into the ventricular fluid are seen in the organum vasculosum of the rabbit. Once this material has reached the ventricular fluid it may be dissolved, and carried to the infundibular recess. After reaching the pericellular environment of arcuate neurons through open gap junctions it may influence their activity."

Scott, D. E., Dudley, G. K., Gibbs, F. P., Brown, G. M.: "The mammalian median

eminence. A comparative and experimental model." In: Knigge, K. M., Scott, D. E. et al., *Brain-Endocrine Interaction. Median Eminence: Structure and Function*, pp. 35-49. Basel and New York: S Karger, 1972.
E10,565/72

Extensive studies in the cat, rat and monkey using transmission and scanning EM, cytochemistry and vascular perfusion with microfil to assess the function of the neuronal, ependymal and vascular constituents of the ME. The ME of "normal squirrel monkeys exhibited unusually large numbers of dense core vesicles (DCV). The DCV population was increased in rats having undergone bilateral adrenalectomy with subsequent dexamethasone administration. Intermediate range DCV, large osmophilic neurosecretory vesicles and junctional structures between the apical plasmalemma of ventricular ependyma were selectively opacified" with certain reagents, which suggests the presence of some basic amino acid residues. Dense inclusions in ependymal perivascular end-feet, as well as EM alterations in their ventricular apices, indicate the possibility of their participation in fundamental neuroendocrine events.

Bleier, R.: "Structural relationship of ependymal cells and their processes within the hypothalamus. Implications for functional localization." In: Knigge, K. M., Scott, D. E. et al., *Brain-Endocrine Interaction. Median Eminence: Structure and Function*, pp. 306-318. Basel and New York: S Karger, 1972.
E10,570/72

Observations on various mammals showed that ependymal cells extend numerous processes into cell groups within the hypothalamus, connecting with neurons and capillaries. "It is postulated that this ependymal system has a secretory and transport role for substances involved in adenohypophyseal regulation and that it forms a framework for the organization of adenohypophyseal functional localization within the hypothalamus."

Calas, A., Hartwig, H. G., Collin, J. P.: "Noradrenergic innervation of the median eminence. Microspectrofluorimetric and pharmacological study in the duck, *Anas platyrhynchos*." *Z. Zellforsch. Mikrosk. Anat.* 147: 491-504 (1974).
J13,342/74

Fluorescent microscopic demonstration of noradrenergic but not of dopaminergic fibers in the subependymal layer of the ME in the duck.

Fornix

(See also our earlier stress monographs, p. xiii)

Nauta, W. J. H.: "An experimental study of the fornix system in the rat." *J. Comp. Neurol.* 104: 247-271 (1956).
J12,752/56

Histologic studies tracing the course of the fornix system after hippocampal lesions in the rat.

Nakadate, G. M., Groot, J. de: "Fornix transection and adrenocortical function in rats." *Anat. Rec.* 145: 338 (1963).

J11,290/63

After complete bilateral transection of the fornix in rats, the circadian variations of corticosterone production disappeared.

Moberg, G. P., Scapagnini, U., Groot, J. de, Ganong, W. F.: "Effect of sectioning the fornix on diurnal fluctuation in plasma corticosterone levels in the rat." *Neuroendocrinology* 7: 11-15 (1971).
H36,762/71

In rats, sectioning of the fornix abolishes the circadian variations in plasma corticosterone by raising the lowest and decreasing the highest values during the day.

Scapagnini, U., Preziosi, P.: "Role of brain norepinephrine and serotonin in the tonic and phasic regulation of hypothalamic hypophyseal adrenal axis." *Arch. Int. Pharmacodyn Ther.* 196 Suppl.: 205-220 (1972).

H56,654/72

Résumé of the literature and the extensive experiments of the authors and their co-workers led to the following main conclusions: (1) There is an adrenergic system in the brain that inhibits ACTH secretion. Drugs that release active catecholamines from nerve endings block ACTH discharge if they can pass the blood-brain barrier or are injected directly into the third ventricle or ME. Stressors deplete brain NEP and increase ACTH secretion. Admittedly, the amount of drugs necessary for inhibition is large compared to the normal catecholamine levels present in the brain, and hence their action is of doubtful physiologic significance. They may act merely by constricting the portal vessels so that CRF cannot reach an adequate concentration in the adenohypophysis. Among the drugs used to explore the ACTH inhibitory adrenergic mechanism were: amphetamine, α -ethyltryptamine, L-dopa, tyramine, α -MT, guanethidine, FLA-63 (an inhibitor of dopamine- β -oxidase), L-threo-dihydroxy-phenyl-serine ("DOPS")

which selectively repletes NEP after depletion of NEP and dopamine by α -MT, phentolamine (an α -blocking agent) and so on. (2) 5-HT appears to regulate the circadian variations of ACTH secretion by the limbic system. Its concentration is particularly high in the raphé nuclei (containing the highest level of serotonergic cell bodies), particularly the amygdala and hippocampus, in which it shows circadian variations. Destruction of these nuclei abolishes circadian plasma corticosterone rhythm.

Lengvári, I., Halász, B.: "Evidence for a diurnal fluctuation in plasma corticosterone levels after fornix transection in the rat." *Neuroendocrinology* 11: 191-196 (1973).

H68,128/73

In rats, immediately after transection of the fornix, the circadian variations in plasma corticosterone disappeared, although they reappeared a few weeks after this operation. It is concluded that "contrary to the assumption of other authors, the fornix is not the key structure in the mediation of extrahypothalamic influences to the medial basal hypothalamus that are essential for the diurnal rhythm in plasma corticosterone levels."

Brown, G. M., Uhlir, I. V., Seggie, J., Schally, A. V., Kastin, A. J.: "Effect of septal lesions on plasma levels of MSH, corticosterone, GH and prolactin before and after exposure to novel environment: role of MSH in the septal syndrome." *Endocrinology* 94: 583-587 (1974). H86,300/74

In rats, septal lesions considerably altered hormonal reactions to various stressors, and concurrently there were pronounced behavioral changes. The literature on the "septal syndrome" is reviewed (26 refs.).

Habenula

(See also our earlier stress monographs, p. xiii)

Milne, R., Stern, P.: "Effect of reserpine on the stressogenic reactivity of habenular-pineal complex." *Anat. Rec.* 136: 243-244 (1958). C95,318/58

In hares, fear caused regressive changes in the internal nuclear habenular ganglion which could be prevented by reserpine. Allegedly, the "results show that the habenular-pineal complex has an important role in the

neuroendocrinology of the general adaptation syndrome."

Nielson, H. C., McIver, A. H.: "Cold stress and habenular lesion effects on rat behaviors." *J. Appl. Physiol.* 21: 655-660 (1966) (30 refs.). G37,781/66

Postnov, Y. V., Strakhov, E. V., Glukhovets, B. I., Gorkova, S. I.: "Hypothalamic neurosecretory nuclei and nucleus habenularis of epithalamus in essential hypertension." *Virchows Arch. [Pathol. Anat.]* 364: 275-283 (1974). H95,408/74

"In patients with essential hypertension, morphological signs of functional hypertrophy were observed in the nucleus habenularis of the epithalamus."

Hippocampus

(See also our earlier stress monographs, p. xiii, and cf. Limbic System)

Kim, C., Kim, C. U.: "Effect of partial hippocampal resection on stress mechanism in rats." *Am. J. Physiol.* 201: 337-340 (1961). D11,353/61

In rats with hippocampal lesions, the adrenal ascorbic acid depletion caused by acute stress was increased, and the rise after chronic stress diminished. Presumably, "the hippocampus exerts a sustained inhibitory influence upon the pituitary-adrenocortical mechanism."

Knigge, K. M.: "Adrenocortical response to stress in rats with lesions in hippocampus and amygdala." *Proc. Soc. Exp. Biol. Med.* 108: 18-21 (1961). D14,359/61

After lesions were placed in the amygdala, the rise in plasma free corticoid levels of rats exposed to the stress of restraint was greatly delayed but not prevented. Lesions in the hippocampus did not alter the chronologic pattern of this stress response, but the basal plasma free corticoid levels were above normal (29 refs.).

Knigge, K. M.: "Adrenocortical response to immobilization in rats with lesions in hippocampus and amygdala." *Fed. Proc.* 20: 185 (1961). D3,983/61

In dogs the resting free plasma corticosterone levels are increased after hippocampal lesions, while lesions in the amygdala depress

the rise in corticoid blood levels after immobilization.

Endrőczi, E., Lissák, K.: "Interrelations between palaeocortical activity and pituitary-adrenocortical function." *Acta Physiol. Acad. Sci. Hung.* **21**: 257-263 (1962).

J11,528/62

In cats, stimulation of the dorsal hippocampus at low frequencies inhibited ACTH release by painful stressors, whereas stimulation at high frequencies increased corticoid output.

Knigge, K. M., Hays, M.: "Evidence of inhibitory role of hippocampus in neural regulation of ACTH release." *Proc. Soc. Exp. Biol. Med.* **114**: 67-69 (1963).

E29,658/63

In rats, plasma corticoid levels rose after ether anesthesia and hemorrhage. Bilateral electrolytic lesions in the midbrain reticular formation or the amygdaloid nuclei suppressed or blocked this response. In such unresponsive animals, additional lesions in the hippocampus negated the block. It is concluded that the "hippocampus contributes an inhibitory component to the neural mechanisms regulating ACTH release."

Mandell, A. J., Chapman, L. F., Rand, R. W., Walter, R. D.: "Plasma corticosteroids: changes in concentration after stimulation of hippocampus and amygdala." *Science* **139**: 1212 (1963). D59,312/63

In patients in whom electrodes were implanted for the evaluation of psychomotor epilepsy, stimulation of the amygdala caused a rise in 17-OHCS, whereas hippocampal stimulation resulted in a decrease.

Liberson, W. T., Bernsohn, J., Wilson, A., Daly, V.: "Brain serotonin content and behavioral stress." *J. Neuropsychiatry* **5**: 363-365 (1964). D17,697/64

In guinea pigs, prolonged hypnosis training significantly decreased the 5-HT content of the cortex and hippocampus, and to a lesser degree, of the brain stem and cerebellum.

McEwen, B. S., Weiss, J. M., Schwartz, L. S.: "Retention of corticosterone by cell nuclei from brain regions of adrenalectomized rats." *Brain Res.* **17**: 471-482 (1970).

J12,015/70

In adrenalectomized rats, nuclear uptake of labeled corticosterone was highest in the

hippocampus, but was also demonstrable in the amygdala and cerebral cortex.

Dupont, A., Bastarache, E., Endrőczi, E., Fortier, C.: "Effect of hippocampal stimulation on the plasma thyrotropin (TSH) and corticosterone responses to acute cold exposure in the rat." *Can. J. Physiol. Pharmacol.* **50**: 364-367 (1972). H54,958/72

In rats, exposure to cold increases both plasma TTH and corticosterone concentration, but concurrent minor environmental stress (presence of observer) suppresses the TTH response and enhances the rise in corticosterone. Concurrent stimulation of the gyrus dentatus of the hippocampus by implanted electrodes restores the TTH response to cold and inhibits the rise in corticosterone. Presumably, "the concurrent stimulation of ACTH release and inhibition of TSH [TTH] secretion induced by nonspecific stress are possibly related to depressed hippocampal activity."

Viru, A., Allikmets, L., Körge, P., Laidna, A.: "Adrenocortical activity during prolonged exertions in rats with lesions in the hippocampus and amygdala." *Estonian Contr. Int. Biol. Program, Tartu, Rep. No. 4*, 145-154 (1973). H86,933/73

After prolonged swimming, the corticoid content of the blood and adrenals decreases in sham-operated and amygdalectomized, but not in hippocampectomized rats. Presumably, "during the prolonged muscular activity, the decrease of the adrenocortical activity is caused by the inhibitory influence from the hippocampus in the regulation of pituitary adrenocorticotropic function."

Yanase, M.: "A study on the role of brain for the establishment of adaptation to the repeated immobilization stress. II. A role of the limbic-midbrain system in the repeated immobilization stress." *J. Physiol. Soc. Jap.* **35**: 171-178 (1973) (Japanese). J17,716/73

In rabbits, ACTH release following repeated restraint diminished as a consequence of adaptation. This was not found after sectioning of the fornix. "Therefore, hippocampal inhibition of ACTH release is considered to correlate with the inhibition of ACTH release under the repeated stress, and hippocampus may play an important role in the establishment of adaptation to the stress."

Wilson, M., Critchlow, V.: "Effect of

fornix transection or hippocampectomy on rhythmic pituitary-adrenal function in the rat." *Neuroendocrinology* **13**: 29-40 (1974).

H81,373/74

In rats, ablation of the hippocampo-fornix system does not disturb the circadian rhythm of plasma corticosterone variations either under nonstress conditions or after ether stress. Dexamethasone produces normal suppression of corticosterone levels.

Kawakami, M., Terasawa, E., Arita, J.: "Effects of hippocampal ablation on stress-induced gonadotropin secretion: an observation of the sexual difference." *Endocrinol. Jap.* **21**: 289-296 (1974). H96,221/74

Various stressors increased FSH in females and in orchidectomized, folliculoid-pretreated males, but this effect was suppressed by hippocampal ablation. Serum LH was not altered by stressors in either sex. "Hippocampal ablation, however, brought about LH release in stressed females and abolished stress-induced increase in LH in orchidectomized estrogen primed males."

Zippel, U., Kolle, U., Gabriel, H.-J., Rüdiger, W.: "Das Entladungsverhalten hippocampaler Neurone unter dem Einfluss eines emotionell negativen bedingten Reizes" (Spike activity of the hippocampus during the influence of an emotionally negative conditioned stimulus). *Acta Biol. Med. Ger.* **32**: 643-649 (1974). J20,836/74

Observations on rats suggest that "emotionally positive stimuli produce an increase in the inhibitory responses in contrast to emotionally negative stimuli which predominantly provoke facilitatory reactions of hippocampal neurones."

Segal, M., Bloom, F. E.: "The action of norepinephrine in the rat hippocampus. I. Iontophoretic studies." *Brain Res.* **72**: 79-97 (1974). J12,390/74

"It is suggested that NE is a neurotransmitter candidate in the hippocampus and that it may act via the cyclic AMP system."

Segal, M., Bloom, F. E.: "The action of norepinephrine in the rat hippocampus. II. Activation of the input pathway." *Brain Res.* **72**: 99-114 (1974). J12,391/74

Baylé, J.-D., Bouillé, C.: "Activité corticosurrénalienne après lésion de l'hippocampe chez le pigeon" (The adrenal cortex function after lesion of the hippocampus in the pigeon). *Gen. Comp. Endocrinol.* **22**: 360-361 (1974). H83,189/74

Bilateral electrolytic lesions of the hippocampus in pigeons raise the basic plasma corticosterone level. The response to immobilization stress is only slightly reduced. Conversely, stimulation of the hippocampus diminishes plasma corticosterone.

Storm-Mathisen, J., Guldberg, H. C.: "5-hydroxytryptamine and noradrenaline in the hippocampal region: effect of transection of afferent pathways on endogenous levels, high affinity uptake and some transmitter-related enzymes." *J. Neurochem.* **22**: 793-803 (1974). J13,464/74

Hypothalamus and Thalamus

(See also our earlier stress monographs, p. xiii, and cf. Stalk, Portal Vessels)

Smith, P. E.: "The disabilities caused by hypophysectomy and their repair. The tuberal (hypothalamic) syndrome in the rat." *J.A.M.A.* **88**: 158-161 (1927).

2,779/27

In rats "a lesion of the hypothalamic region of the brain (tuber cinereum) gives rise to a syndrome which is distinct from that caused by pituitary ablation. This tuberal syndrome is characterized by extreme obesity and an atrophy of the genital system; neither the thyroids nor the suprarenal cortex atrophy."

Krieg, W. J. S.: "The hypothalamus of the albino rat." *J. Comp. Neurol.* **55**: 19-89 (1932). B26,941/32

Excellent description of seventeen nuclei that are subdivided and schematically reproduced to show their spatial relations (about 50 refs.).

Houssay, B. A., Biasotti, A., Sammartino, R.: "Modifications fonctionnelles de l'hypophyse après les lésions infundibulo-tubériennes chez le crapaud" (Functional changes of the hypophysis after lesions of the lobus infundibularis in toads). *C.R. Soc. Biol. (Paris)* **120**: 725-727 (1935). 56,016/35

In the toad the hypothalamus consists of a pars basalis, lamina terminalis and lobus infundibularis. The latter is attached to the hypophysis. Lesions of the lobus infundibularis cause circulatory arrest in the principal lobe of the hypophysis with increased absorption of MTH, darkening of the animal, and other hormonal derangements.

Ranson, S. W., Fisher, C., Ingram, W. R.: "Adiposity and diabetes mellitus in a monkey with hypothalamic lesions." *Endocrinology* **23**: 175-181 (1938). A17,002/38

In rhesus monkeys, hypothalamic lesions conducive to diabetes mellitus and adiposity were not associated with any detectable adrenal change.

Ranson, S. W., Magoun, H. W.: "The hypothalamus." *Ergeb. Physiol.* **41**: 56-163 (1939). A19,119/39

Monograph on the structure and function of the hypothalamus, with special reference to its anatomy, neural connections with other parts of the CNS, and the influence of hypothalamic lesions upon psychic disturbances, somnolence, pituitary function, adiposity, carbohydrate metabolism, diabetes insipidus and thermoregulation (approximately 300 refs.).

Scharrer, E., Scharrer, B.: "Secretory cells within the hypothalamus." *Res. Publ. Assoc. Res. Nerv. Ment. Dis.* **20**: 170-194 (1940). 78,342/40

Excellent and well-illustrated review of secretory neurons in the hypothalamus of various vertebrates.

Dankmeijer, J., Nauta, W. J. H.: "Studies on the hypothalamic region of the diencephalon. II. The magnocellular hypothalamic nuclei of the guinea-pig." *Acta Neur. Morphol.* **5**: 363-377 (1945). B61,953/45

Harris, G. W.: "Neural control of the pituitary gland." *Physiol. Rev.* **28**: 139-179 (1948). B26,619/48

A classic review on nervous factors controlling pituitary activity in which the author describes his first observations on the regulation of ACTH secretion by the hypothalamus during stress (450 refs.).

McDermott, W. V., Fry, E. G., Brobeck, J. R., Long, C. N. H.: "Release of adrenocorticotropic hormone by direct application of epinephrine to pituitary grafts." *Proc. Soc. Exp. Biol. Med.* **73**: 609-610 (1950). B48,233/50

"Homologous grafts of pituitary tissue to the anterior chamber of the eye of the hypophysectomized rat retain the ability to secrete ACTH, both spontaneously and in response to activation by epinephrine. The effect of epinephrine in releasing ACTH may be brought about by its direct application to anterior pituitary tissue."

Nowakowski, H.: "Infundibulum und Tu-

ber cinereum der Katze" (The infundibulum and the tuber cinereum in the cat). *Dtsch. Z. Nervenheik* **165**: 261-339 (1951).

B60,898/51

Detailed anatomic studies on the structure of the tuber and infundibulum of the cat, with special reference to its possible role in the regulation of adenohypophyseal secretion.

Porter, R. W.: "Alterations in electrical activity of the hypothalamus induced by stress stimuli." *Am. J. Physiol.* **169**: 629-637 (1952). B74,875/52

"In cats and monkeys, a marked increase in electrical activity, limited to the posterior hypothalamus, was induced by epinephrine and other stimuli, the stressful nature of which was indicated by a resulting eosinopenia. Minimal electrocortical changes also occurred, but hypothalamic discharge was uninfluenced by decortication or by transection of the lower brain stem. Considered generally, these results provide added support for participation of the brain in the pituitary-adrenal response to stress."

Hume, D. M.: "The relationship of the hypothalamus to the pituitary secretion of ACTH." In: Wolstenholme, G. E. W., *Ciba Found. Colloquia on Endocrinology*, Vol. 4, pp. 87-99. London: J & A Churchill, 1952. B76,068/52

Harris, G. W.: "The hypothalamus and regulation of ACTH secretion." In: Ralli, E. P., *Adrenal Cortex*, pp. 54-88. New York: Josiah Macy Jr., Foundation, 1952.

B70,924/52

Proceedings of a symposium in which the hypothalamic control of ACTH secretion was discussed by a number of specialists (36 refs.).

Bogdanove, E. M., Halmi, N. S.: "Effects of hypothalamic lesions and subsequent propylthiouracil treatment on pituitary structure and function in the rat." *Endocrinology* **53**: 274-292 (1953). B86,246/53

In rats with lesions in various parts of the hypothalamus, administration of propylthiouracil inhibited adrenal and/or thyroid enlargement, but the number of animals was small and adrenal size too variable to draw definite conclusions concerning the exact location of the various regulating centers.

Knoche, H.: "Ueber das Vorkommen eigenartiger Nervenfasern (Nodus-fasern) in Hypophyse und Zwischenhirn von Hund

und Mensch" (The occurrence of peculiar nerve fibers [nodulus fibers] in the hypophysis and the hypothalamus of the dog and man). *Acta Anat.* 18: 208-223 (1953).

B85,818/53

In the dog and man, "there are nervous 'nodulus fibres' in the tuber cinereum, the nucleus supraopticus, nucleus paraventricularis and in the neurohypophysis. The nerve fibres show nodules of different size or ring-like structures; they join the nerve cells of the tuber cinereum and they are continued into the peripheral part of the infundibulum." They are readily demonstrable with the silver impregnation (Gomori and Nissl) technique, but their functional significance is unknown.

Porter, R. W.: "I. Nervous system—Hormone interrelationships. The central nervous system and stress-induced eosinopenia." *Rec. Prog. Horm. Res.* 10: 1-18 (1954).

B98,592/54

In rhesus monkeys the nervous regulation of the pituitary-adrenocortical response to stress was demonstrated by the following observations: "1) Increased electrical activity was noted in the posterior hypothalamus on application of certain acute stress stimuli. 2) The integrity of the hypothalamus was essential for the production of stress-induced eosinopenia. 3) Electrical excitation of this region evoked a marked eosinopenia. It was concluded that although many regions of the brain can modify the eosinopenic response to an acute stress stimulus, the hypothalamus alone is essential for its manifestation."

Xuereb, G. P., Prichard, M. M. L., Daniel, P. M.: "The hypophysial portal system of vessels in man." *Q. J. Exp. Physiol.* 39: 219-230 (1954).

C5,988/54

Folkow, B., Euler, U. S. von: "Selective activation of noradrenaline and adrenaline producing cells in the cat's adrenal gland by hypothalamic stimulation." *Circ. Res.* 2: 191-195 (1954).

J12,802/54

In cats, stimulation of different parts of the hypothalamus may lead to secretion of either EP or NEP. Presumably, "the two hormones are secreted from different cells with separate innervation."

McCann, S. M., Sydnor, K. L.: "Blood and pituitary adrenocorticotrophin in adrenalectomized rats with hypothalamic lesions." *Proc. Soc. Exp. Biol. Med.* 87: 369-373 (1954).

E53,302/54

In adrenalectomized rats subjected to

stress (ether, hemorrhage), lesions of the ME inhibited ACTH secretion and also interrupted the supraopticohypophyseal tract (causing diabetes insipidus).

McCann, S. M., Brobeck, J. R.: "Evidence for a role of the supraopticohypophyseal system in regulation of adrenocorticotrophin secretion." *Proc. Soc. Exp. Biol. Med.* 87: 318-324 (1954).

J9,398/54

In rats, variously placed hypothalamic lesions which block ACTH secretion (as indicated by adrenal ascorbic acid depletion, adrenal weight, plasma ACTH) always destroy large areas of the supraopticohypophyseal tract and cause diabetes insipidus. Large doses of vasopressin stimulate ACTH secretion in these rats. "It appears likely, therefore, that destruction of the median eminence is not a necessary condition for blockade of the stress response and that destruction of a large percentage of the supraopticohypophyseal tract is the most constant feature in rats with effective lesions of the hypothalamus."

Hume, D. M., Nelson, D. H.: "Effect of hypothalamic lesions on blood ACTH levels and 17-hydroxycorticosteroid secretion following trauma in the dog." *J. Clin. Endocrinol. Metab.* 15: 839 (1955).

Katsuki, S., Ikemoto, T., Shimada, H., Hagiwara, F., Kanai, J.: "The functional relationship between the hypothalamus and the anterior pituitary-adrenal system." *Endocrinol. Jap.* 2: 304-312 (1955).

C31,375/55

In cats, electric stimulation of the posterior hypothalamus caused an increase in the corticoid content of adrenal venous blood, whereas stimulation of the middle part of the hypothalamus resulted in considerable catecholamine secretion.

Bogdanove, E. M., Spirtos, B. N., Halmi, N. S.: "Further observations on pituitary structure and function in rats bearing hypothalamic lesions." *Endocrinology* 57: 302-315 (1955).

D78,841/55

Endrőczi, E., Mess, B.: "Einfluss von Hypothalamusläsionen auf die Funktion des Hypophysen-Nebennierenrinden-Systems" (Effect of hypothalamic lesions on the hypophyseal-adrenal system). *Endokrinologie* 33: 1-8 (1955).

C10,158/55

In rats the effects of stereotaxic lesions placed in various parts of the hypothalamus suggest that only lesions in the region of the tuber cinereum inhibit the increase in ACTH

secretion produced by EP or unilateral adrenalectomy (11 refs.).

Born, F.: "Neurosecretion in man under strain. I. A survey and a contribution." *Acta Psychiatr. Scand.* **30**: 65-76 (1955).

J25,483/55

The structure of the supraoptic nucleus is compared in controls and in patients who died of protracted psychic or somatic stress. Studies indicate that "both the character and the intensity of the terminal stress is determinative of the degree of vacuolization, resp. of the neurosecretory activity changes."

Anand, B. K., Dua, S.: "Hypothalamic involvement in the pituitary adreno-cortical response." *J. Physiol. (Lond.)* **127**: 153-156 (1955).

C6,203/55

In unanesthetized cats with permanently implanted electrodes, it was found that "after stimulating the medial part of the anterior and middle hypothalamic regions (anteromedial region of the median eminence of tuber cinereum), the average reduction in eosinophil count was 25% or more of the original level. It is therefore assumed that these hypothalamic regions are concerned with ACTH secretion."

Ganong, W. F., Fredrickson, D. S., Hume, D. M.: "The effect of hypothalamic lesions on thyroid function in the dog." *Endocrinology* **57**: 355-362 (1955).

C8,317/55

In dogs, hypothalamic lesions just above the anterior end of the ME produced thyroid atrophy that was not necessarily correlated with a deficient eosinopenic response to stress or gonadal atrophy. Apparently, the exact position of the lesion determines which trophic function is destroyed.

Cleghorn, R. A.: "The hypothalamic-endocrine system." *Psychosom. Med.* **17**: 367-376 (1955) (77 refs.).

D79,914/55

Noda, H., Sano, Y., Oki, S., Saito, O.: "Ueber den neurosekretorischen Tractus tuberohypophyseus. I. Seine Existenz beim Hunde (Beiträge zur vergleichenden Histologie des Hypothalamus-Hypophysensystems. 17. Mitteilung)" (The neurosecretory tractus tuberohypophyseus. I. Its existence in the dog [Comparative histology of the hypothalamic-hypophyseal system. 17th report]). *Arch. Histol. Jap.* **10**: 63-70 (1956) (Japanese, with German summary).

C27,048/56

Description of neurosecretory nerves in the eye that originate in the subependymal

part of the lateral wall of the third ventricle, mostly in the region of the nucleus infundibularis tuberis of Spatz. Their cell bodies are small and are somewhat less tingible with the Gomori system than are the nodular dilatations in their processes, which descend through the tuber towards the hypophysis. It is uncertain whether they reach the latter, but "they undoubtedly represent a neurosecretory pathway between the tuber cinereum and the pituitary region."

Endrőczi, E., Kovács, S., Lissák, K.: "Die Wirkung der Hypothalamusreizung auf das endokrine und somatische Verhalten" (Endocrine and somatic responses to hypothalamic stimulation). *Endocrinologie* **33**: 271-278 (1956).

C23,659/56

Electric stimulation of various regions of the hypothalamus or thalamus in the rat was tested for its ability to cause ACTH secretion. Purely motor reactions produced no endocrine response, and it was concluded that "affective loading" is indispensable for the mobilization of endocrine adaptive phenomena during the G.A.S. Adrenal demedullation did not prevent such responses.

Halász, B.: "Die Rückwirkung von Cortisonzufuhr auf den Bau der Nebennierenrinde nach Hypothalamusläsion" (Retroactive effects of cortisone on the structure of the adrenal cortex after hypothalamic lesions). *Acta Morphol. Acad. Sci. Hung.* **6**: 119-127 (1956).

J13,132/56

In rats, adrenocortical atrophy produced by cortisone is not prevented by lesions in the posterior tuberal nuclei, or by transection of the hypophyseal stalk. However, depletion of lipids in the zona fasciculata and reticularis, as seen in cortisone-treated intact rats, is blocked by lesions in the posterior tuberal region (22 refs.).

Gloor, P.: "Telencephalic influences upon the hypothalamus." In: Fields, W. S., Guillemin, R. et al., *Hypothalamic-Hypophysial Interrelationships. A Symposium*, pp. 74-113. Springfield, Ill.: Charles C Thomas, 1956.

C23,838/56

Saffran, M.: "Stress and the pituitary." (Symposium on Stress, Montreal, November 18, 1955). *Psychiatr. Res. Rep. APA* **7**: 1-9 (1957).

C46,633/57

Brief description of the earliest experiments concerning the hypothalamic regulation of ACTH secretion.

Schmid, R., Gonzalo, L., Blobel, R.,

Muschke, E., Tonutti, E.: "Über die hypothalamische Steuerung der ACTH-Abgabe aus der Hypophyse bei Diphtherie-Toxin-Vergiftung" (The hypothalamic regulation of ACTH release from the hypophysis in poisoning by diphtheria toxin). *Endocrinologie* **34**: 65-91 (1957). D74,892/57

In guinea pigs, selective destruction of anterior or posterior hypothalamic nuclei did not prevent the hemorrhagic necrosis of the adrenals normally produced by bacterial endotoxin. Lesions situated closer to the pituitary stalk did offer protection against this effect.

Endrőczi, E., Kovacs, S., Szalay, G.: "Einfluss von Hypothalamusläsionen auf die Entwicklung des Körpers und verschiedener Organe bei neugeborenen Tieren" (The influence of hypothalamic lesions on the somatic growth and development of various organs in newborn animals). *Endocrinologie* **34**: 168-175 (1957). C32,398/57

In newborn rats and dogs, electrocoagulation in the anterior hypothalamus greatly inhibits somatic growth but does not interfere markedly with the development of internal organs, including the thyroid and adrenals. Similar lesions in the posterior hypothalamus cause no change in somatic growth, but they do inhibit development of the adrenals, liver and kidney.

Slusher, M. A.: "Dissociation of adrenal ascorbic acid and corticosterone responses to stress in rats with hypothalamic lesions." *Endocrinology* **63**: 412-419 (1958).

C58,603/58

In rats, "lesions in the posterior and mid-central portions of the hypothalamus specifically inhibited corticosterone release without altering adrenal ascorbic acid response or the weights of target organs dependent upon the normal production of pituitary hormones. Similarly, lesions in the basal tuberal region inhibited adrenal ascorbic acid depletion without affecting corticosterone release in response to stress." Gross damage to the ME, basal tuberal region, and portal systems blocked both adrenal responses.

Mason, J. W.: "Plasma 17-hydroxycorticosteroid response to hypothalamic stimulation in the conscious rhesus monkey." *Endocrinology* **63**: 403-411 (1958).

C58,602/58

In conscious rhesus monkeys, stimulation of the hypothalamus by implanted electrodes caused a marked elevation of plasma 17-

OHCS, comparable to that obtained by intravenous ACTH. No similar changes were produced by stimulation of the putamen or anterior thalamus.

Hume, D. M.: "Hypothalamic localization for the control of various endocrine secretions." In: Jasper, H. H., Proctor, L. D. et al., *Reticular Formation of the Brain*, pp. 231-262. Boston: Little, Brown, 1958.

C78,257/58

A review of the literature and personal observations on dogs with well-localized electrolytic lesions "suggest that there are three separate zones in the hypothalamus for the control of TSH, ACTH, and GTH [gonadotrophic hormone] secretion. The TSH and ACTH areas overlap and are located in the anterior portion of the median eminence and the postoptic area. The location of the area for the control of the gonadotropic hormones is in the posterior limb of the stalk, completely separate from the area for ACTH and TSH control and well localized to this rather small zone in the hypothalamus" (13 refs.).

Bachrach, D., Kordon, C.: "Suppression de l'hypertrophie surrénalienne compensatrice à la suite de lésions hypothalamiques chez le rat" (Prevention of compensatory hypertrophy of the adrenal following hypothalamic lesions in the rat). *C.R. Acad. Sci. (Paris)* **247**: 2462-2464 (1958).

C90,729/58

In rats, only lesions in the anterior or central part of the basal hypothalamus prevent compensatory hypertrophy of the remaining adrenal following unilateral adrenalectomy.

Smelik, P. G.: "Modifying effect of hypothalamic lesions on the adrenal stress response." *Acta Endocrinol. (Kbh.)* **28** Supp. 38: 84 (1958).

C59,251/58

Destruction of the posterior hypothalamus ("sympathetic area") induces a pronounced adrenal ascorbic acid depletion, while lesions in the anterior hypothalamus ("parasympathetic area") inhibit this response, even after exposure to stress.

Koibuchi, E.: "The effects of hypothalamic lesions of the pituitary-adrenocortical system." *Endocrinol. Jap.* **5**: 89-98 (1958).

C57,340/58

In rats, lesions in the anterior hypothalamus and the anterior part of the medial hypothalamus caused atrophy of the hypophysis and adrenals. These changes were suppressed by vasopressin. "It seemed likely that the control center of ACTH release is found in

the anterior hypothalamus of the anterior part of the medial hypothalamus, and that vasopressin accelerates the release of ACTH."

In dogs, ventral hypothalamic lesions produced diabetes insipidus with gonadal atrophy and/or inhibition of 17-OHCS secretion in response to surgical trauma. However, none of these animals showed abnormal sodium or potassium metabolism and all withstood salt restriction and salt load in a normal fashion.

Doctoral dissertation on hypothalamo-pituitary interrelations. The evidence that CRF is identical with vasopressin is based mainly on the observations that the neurosecretory material mobilized into the portal vessels during stress is associated with a rise of plasma vasopressin, and that commercial vasopressin preparations cause ACTH discharge from the pituitary of cortisol-treated or hypophysectomized rats. However, the demonstration of such a parallelism is no proof of the identity of the two hormones. Furthermore, data are given to indicate that, contrary to the theory of Sayers and Sayers, adrenal stimulation during stress is not due to a drop in blood corticoid levels, and that the corticoid feedback mechanism is not necessarily exerted on both the hypothalamus and pituitary, as postulated by McCann. The author writes that McCann and his associates reported that "in rats bearing hypothalamic lesions which reduced the compensatory adrenal hypertrophy after unilateral adrenalectomy, a further inhibition of this hypertrophy could be obtained by daily administration of hydrocortisone. They assumed, therefore, that corticoids suppress both the release of the CRF and the excitability of the hypophysis itself. This evidence is not convincing, since their
